the Mounted Infantry Corps. Entering Guy's Hospital in 1908, he had a successful academic career, and was recognised as a man of strong character, who inspired confidence in those with whom he came in contact. After qualifying in 1912, he held house appointments at his hospital for two years, surrendering the post of resident obstetrician in 1915 to join the Royal Army Medical Corps. He soon became attached to the Rawalpindi Hospital, with which, in November, 1915, he was transferred to Mesopotamia, where he remained until his death.

One of his hospital intimates writes of Captain Seabrooke: "A man of fine physique and an appearance which befitted his strong character. It is no exaggeration to say Seabrooke was one of the most popular men of his time at Guy's. His sympathy took practical form: he was in the habit of visiting his old patients who were too feeble to attend at the hospital in their homes, giving them both advice and financial assistance. Whilst on active service he wrote letters of condolence

to the relatives of any soldier under his care who died. He corresponded regularly with his friends, and his letters were full of human interest. In the last of these, referring to the death in Egypt of one of his friends at Guy's, he says 'He was a good fellow and if one has to die, it is some satisfaction to one's people that one died doing one's duty.' Duty, self-sacrifice, and a consideration for others were Seabrooke's watchwords, and will keep his memory green in the hearts of the many sorrowing friends whom he leaves behind."

DEATHS AMONG THE SONS OF MEDICAL MEN

The following sons of medical men must be added to our lists of those who have fallen during the war—

Lieutenant J. H. Parr Dudley Royal Fusiliers eldest son of Dr A. D. Parr Dudley, of East Malling Kent
Major V. L. S. Beckett Yorkshire Regiment, youngest son of the late Dr F. N. Beckett of Elv, Cambs
Second Lieutenant A. E. G. Mason, Leicestershire Regiment second son of Dr H. Mason, of Leicester
Lieutenant T. M. MacQueen East Lancashire Regiment, second son of Dr T. MacQueen, of Eastbourne
Major C. G. Phillips King's Own Regiment, younger son of the late Dr R. Phillips of Bromley, Kent
Private M. P. H. Blumer, Middlesex Regiment, only son of Dr P. Blumer, of Muswell Hill London, N
Second Lieutenant W. E. Limont, Northumberland Fusiliers, only son of the late Dr J. Limont, of Newcastle-on-Tyne
Captain W. J. MacCombie King's Own Scottish Borderers only surviving son of Dr J. MacCombie, of Rothwell Northants
Second Lieutenant E. P. Doyle eldest son of Dr E. A. G. Doyle of San Fernando Trinidad
Captain C. V. Suckling Royal Warwickshire Regiment, younger son of Dr C. W. Suckling of Edgbaston, Birmingham
E. T. D. Fooks, Machine Gun Company New Zealand Forces, youngest son of Lieutenant-Colonel Fooks, I.M.S.

AUXILIARY R.A.M.C. FUNDS

A general meeting will be held in the Lecture Theatre of the Royal Army Medical College, Grosvenor road, London, S.W., at 2.45 p.m., on Monday, August 7th, at which the Director General will preside. It will be remembered that at a meeting held on June 26th it was decided to postpone consideration of the scheme formulated by a Provisional Committee until the constituency had had a full opportunity of discussing its provisions. A large attendance of officers is desired at the forthcoming meeting in order to deal adequately with the important business which is to come up.

SCOTTISH MEDICAL SERVICE EMERGENCY COMMITTEE

The Executive Committee having authorized the issue of the first call under the new system arrangements have been made for hearing those who desired to put forward reasons for postponement. Sheriff Fleming, K.O., outlined the method of procedure to be followed, and referred to the very special responsibilities which had been placed on the medical profession. The President of the Royal College of Surgeons presented the list of the suggested staff of an Edinburgh Hospital for service abroad. Its formal approval completes the Scottish Hospital contingent the Glasgow and Aberdeen hospitals having been approved at previous meetings.

BRITISH INTERNED PRISONERS OF WAR.—We hear from a member of the Swiss Commission appointed to visit the prisoners' camps in Germany that about 1000 British prisoners have been selected. These will have to pass a second commission but it is hoped that 800 or 900 will shortly be interned in Switzerland, bringing up the total to 1200-1400.

MEDICAL IMPRESSIONS OF THE GALLIOLI CAMPAIGN.—In the current number of the *Journal of the Royal Army Medical Service* Temporary Surgeon J. N. MacBean Ross, R.N., gives the impressions of a battalion medical officer on the medical conditions of the Gallipoli peninsula between September 1915 and January 1916. The amount of sickness was such that all the sick men could not be sent to field ambulance and hence every

man who could carry on at all was kept with his battalion and treated by its medical officer. The sick-bay in the rest-camp consisted of only a small dug out, with nothing more substantial than ground sheets laced together to keep out rain, wind, and shells, and under these primitive conditions cases of dysentery, diarrhoea, paratyphoid, jaundice, trench fever, frost-bite and nephritis were treated with the results which the writer relates. He thinks that the description of the course of the numerous cases which were not sent to hospital may give the reader a clearer conception of the real severity of certain war diseases.

TREATMENT OF LIMBLESS SOLDIERS.—It is announced that the Army Council has decided to accept the offer of the Committee of the Ulster Volunteer Force Hospital to give that place as an institution where limbless soldiers can be received and treated.

A RED CROSS REST-HOUSE AT HOBART.—At the suggestion of Sir Ellison Macartney, Governor of Tasmania, a rest-house with 20 beds and a day accommodation for 100 soldiers is being established at Hobart by the Red Cross Society.

A HOSPITAL FOR CANADIAN OFFICERS.—A new hospital for Canadian officers at Putney Heath, presented by Mr W. Perkins Bull, K.C., containing 35 beds, was opened on July 19th by the Lord Mayor of London. Surgeon General Jones, who was present at the opening, expressed the gratitude of the Canadian Army Medical Service for the gift. Intended primarily for Canadian officers, the hospital will also be open for officers of the Imperial Service generally.

THE EMPLOYMENT OF WOMEN DOCTORS IN MILITARY HOSPITALS.—The War Office has for long past utilised the services of women doctors as bacteriologists and radiologists. As the need of medical officers steadily grows, the openings for women in military hospitals widen. Some 40 medical women have recently been chosen for foreign service of whom a number are to go to Malta. All of these possess special qualifications for the work to which they have been allotted. An American qualification has in special instances been recognised.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—At the Preliminary Science Examination for the Licence in Dental Surgery held on July 18th, 20th and 21st, the following candidates were approved in the undermentioned subjects—

Chemistry and Physics—Fanny Henriette Bachrach London School of Medicine for Women, Harry Charles Blackmore Polytechnic Institute, Arthur Leslie Burwell Taunton School, Henry Valentine Croucher Guy's Hospital, Nathaniel Gerson London Hospital, Herbert Oliver Holmes Guy's Hospital, Frederick Laurence King Central Foundation School, Malcolm John Matley Moore Municipal Technical School Birmingham, Charles Lindley Donald Pasmore Technical College Swansea, Edward Reinhold Pfaff Bristol University and Harry Mullins Worth University College Exeter.

Physics—Levi Austin Beran, University College of North Wales Bangor, George Bernard Burke Technical College Finsbury, Alastair Hyland Grieve, Birkbeck College and Herbert Augustus Spouse special study.

Chemistry—Jamshed Bejunjee Chenoy Royal Dental Hospital.

LONDON SCHOOL OF TROPICAL MEDICINE.—The following were the successful candidates at the examination held at the termination of the fifth first session (May-July, 1916)—

*H. L. Cumming and K. T. Jungalwalla (with distinction), J. B. Flamer-Calders, S. C. Biswas, J. T. Watt, G. T. Makhijani and Miss L. N. Clough.

*Dr. Cumming gains both the "Duncan" and "Lalceux" medals. The former is awarded to the student who obtains the highest aggregate of marks for the session the latter being awarded to the student who gains the highest marks for the academic year.

SOCIETY OF APOTHECARIES OF LONDON.—At examinations held recently the following candidates passed in the subjects indicated—

Surgery—C. P. Barber (Section I), Charing Cross Hospital and G. A. Crowe (Sections I and II) and H. M. Holborn (Section II) London Hospital.

Medicine—H. T. Lamb (Sections I and II), Guy's Hospital and Manchester, E. O. Morrison (Sections I and II), Cambridge and S. Mary's Hospital and S. L. Sipliger (Section I), London.

Forensic Medicine.—H T Lamb, Guy's Hospital and Manchester and S L Szpiagner London Hospital
Midwifery.—J L D Buxton University College Hospital A. L. Malabre Washington J S Matthews University College Hospital A. McL. Pickup, Birmingham and E J G Sargent, St Bartholomew's Hospital
 The diploma of the Society was granted to the following candidates, entitling them to practise medicine, surgery, and midwifery:—G A. Crowe, H T Lamb and A L. Malabre

UNIVERSITY OF SHEFFIELD—At examinations held recently the following candidates were successful —

Final Examination for the M.B. Ch.B. Degrees—Frederick Gamm Lydia M Henry Frederick G B Hill George K. E. Inman Florence E Millard Robert H. Rae and William Sharrard.
Third Examination for the M.B. Ch.B. Degrees—Mary Andrews Annie Clark, Ethel M. Mathews, and Winifred H. Wells (distinction in Pathology and Pharmacology)
First Examination for the M.B. Ch.B. Degrees—Constance M. Chappell (distinction in Chemistry), Edgar S. Clayton, and Richard T. Lee (distinction in Chemistry)

ROYAL COLLEGE OF SURGEONS OF EDINBURGH—At a meeting of the College held on July 20th the following having passed the requisite examinations were admitted Fellows —

Ivan Wanless Dickson M.B. Toronto Univ., M.O.P. & S. Ontario, M.R.O.S. Eng. L.R.C.P. Lond. George Hamilton Ross Hamilton M.B. Toronto Univ., M.O.P. & S. Ontario William Howard Thomas M.B. B.S. New Zealand; Henry Richard Hodgkinson M.B. M.S. Sydney Wesley John Jenner L.R.O.S. Edin (Triple Qualification) Bireswar Mitra, L.M.S. Calcutta, M.R.C.S. Eng. L.R.C.P. Lond. and Charles William Sharp L.R.O.S. Edin (Triple Qualification)

QUEEN'S UNIVERSITY OF BELFAST—At the summer graduation ceremony of Queen's University, Belfast, held on July 11th, reference was made alike to the number of professors, lecturers, and students who were serving in various parts of this widespread war, as well as to those who had received special distinction, like Captain J. A. Sinton, M.B., of the I.M.S., who gained the coveted V.C., and last, but not least, to those who had fallen. Among the latter were the names of F. L. Cleland, M.B., captain, R.A.M.C., B. C. Lettis, M.B., lieutenant, R.A.M.C., T. D. Liddle, M.B., staff surgeon, R.N., H. F. McNally, M.B., surgeon, R.N., and F. J. Wisely M.B., lieutenant, R.A.M.C.—At examinations held recently the following candidates were successful —

FIRST MEDICAL EXAMINATION

Botany and Zoology—Marion O. Alexander Frederick M. Allen Victor D. Allison, Eileen O. Bartley Walter E. Beck Joseph F. Blaine John W. Bradbury James S. Briggs Cawthorne L. Broomhead Robert J. B. Christie Henry H. Coulter Martha J. Craig Alexander Cromie, Robert L. Dadds William F. Donaghy John S. Dundee John H. Duke Robert Duncan, John H. Dunn Abraham E. Elliott, Maurice G. Emery Patrick J. Flood Helen R. Forbes Patrick L. Fullen James F. Gausson Thomas Giffellan Winifred B. Hadden, Henry Harris, Patrick J. Homan Thomas J. Hull Lydia N. Humphreys, Richard H. Hunter Gilbert M. Irvine Thomas E. V. Irwin Robert S. Johnston Winifred M. Johnston James W. Kernohan James S. J. Lee Sydney W. T. Lee, Daniel W. McCaugham Dorothy M. McCullagh Philip J. McGarry John J. McKane, Robert J. McMillan Beattie McNeill Henry McNeill, Eveline F. Magee, James P. Martin Joseph Meban Elizabeth Michael Horatio N. Middleton Philip P. Mooney Edward Moore, John W. Nesbitt, James J. O'Reilly John Patton, Robert Pedlow John D. Reynolds, Joseph Reynolds Frederick W. Robinson, James Scott, Laura G. H. Scott William J. Simpson, Arthur O. Sinclair George T. W. Sloan Samuel H. Stewart, Kathleen R. Snodgrass Margaret W. Snodgrass, Samuel A. M. Thompson and James B. Willey

Chemistry and Physics—Marion O. Alexander John O'Connell Wm. E. D. Crawford Robert L. Dadds Patrick J. Flood, Charles L. Graham Henry Harris Thomas J. Hull Dorothy M. McCullagh James P. Martin Joseph Meban John W. Nesbitt, Martha Reid (Chemistry only) John D. Reynolds, Joseph Reynolds, James Scott, and Arthur O. Sinclair

SECOND MEDICAL EXAMINATION

Anatomy and Physiology—William R. Abernethy, Samuel Ballantine John Black Crawford Blair, Helen M. Calwell James Camac, Hugh Carson, John Caruth Jane Oopes (Physiology only) David Cromie Eric A. Davison Winnifred A. I. M. Doherty Benjamin Herbert, Alexander MacPaul Thomas H. McKenna, Robert J. McNeill Olive Maxwell Helen M. Murnane (Physiology only) Robert Nimmous David G. Roulston Margaret H. Russell Alex. McIl. W. Segard Samuel Stams, Samuel Y. Sterling, Hugh J. Taggart, and James B. Wilton.

THIRD MEDICAL EXAMINATION

Medical Jurisprudence and Hygiene—Herbert Abernethy John Barron Annie E. B. Beattie Fredk. O. S. Bradbury Samuel F. Breakey Frederick Campbell Thomas I. Candy Gladys E. Chambers Janie Clarke Joseph M. Clearkin Gerard J. Crawford Samuel E. Duff Charles W. A. Emery Stewart Fullerton John Grimson, Samuel Hall John M. Hosey Mary E. Irwin William J. Keown Michael G. Kierans, Joseph G. M. Leyden William J. Lyttle, Amy C. McCallum, John McGarry, Daniel McLister Henry F. Macaulay Edward A. Maguire, John A. Martin Thomas Montgomery Patrick J. Murnane David A. E. Scott, Ruth M. Slade, and Samuel J. Smyth.

Pathology and Materia Medica—Herbert Abernethy, John F. Ainley Annie E. B. Beattie, Frederick O. S. Bradbury Samuel F. Breakey Frederick Campbell Thomas I. Candy Gladys E. Chambers, Janie Clarke Gerard J. Crawford, Samuel E. Duff William Graham, William Harvey Mary E. Irwin Albert E. Keown Michael G.

Kierans William J. Lyttle Amy C. McCallum John McGarry William O. McKee Daniel McLister Henry F. Macaulay Edward A. Maguire, John A. Martin, Thomas Montgomery David A. E. Scott, and Samuel J. Smyth.

M.B. B.Ch. and B.A.O. EXAMINATION

William F. Algeo, James Boyd (second class) William Bryars Alfred G. P. Campbell, George Chesney Alfred O. Dickey Grace M. English (first class) Francis Ewart (second class) Hugh E. Hall James A. Harbison, Arabella O. Kirker Nathaniel McCulloch, Joseph P. McHizley (first class) Bernard W. McKinney (second class), Michael McMenamin Frederick McSorley John J. Mamer, Thomas J. Mamer, David Mitchell (second class) Elizabeth M. Moore, Margaret S. Purce (first class) Charles A. W. Ramsey Robert J. Res. William Sanderson Thomas R. S. Thompson, Norman O. L. B. Tweedie, and John H. Vance
M.D. Degree—William W. D. Thomson (gold medal) and James M. Warnock
Diploma in Public Health—Alexander E. Knight William J. MacKeown and Charles J. Milligan

TRINITY COLLEGE, DUBLIN SCHOOL OF PHYSIC—At examinations held recently the following candidates were successful —

PRELIMINARY SCIENTIFIC MEDICAL EXAMINATION

Physics—Joseph Eugene Deane William Randolph Macne John Richard Waugh Salomon Louis Feldman Harry Ortolot Dundon and Mary Horan (equal) Joseph Hirschman and Robert Sturgeon Chapman and John Joseph Martin (equal)
Chemistry—Maurice Nurock, Eric Henry Cooke Allen John Lal, Janie Millar Cummins David John Browne Francis Victor Small, Leonard Abrahamson William James Alexander Russell and Robert Henry Mulhall Corbet (equal), James Alexander Smith Doris Louisa Graham Isaac Levy Robert Dormer and Percival Israel Levitt (equal) William Randolph Macne and Eric Richard Murray (equal) Joseph Ballantyne Maguire Samuel Wallace Jamison and David Samuel Thomson (equal), Robert Sturgeon Chapman and Thomas Donald Gordon and William Bernard Pemberton (equal) Harry Ortolot Dundon Molra Mary Brown and Richard Victor Downes and Essie Stuart Smyth (equal) Olive Balle Christopher John Lawrence Brock and John Richard Waugh (equal), Salomon Louis Feldman William Burton Fox and Herbert Francis Mooney (equal) and James Joseph Patrick Kelly

INTERMEDIATE MEDICAL EXAMINATION PART I

Anatomy and Physiology—Cecil Emrys McQuade Richard Counihan John Henry Brenell Crosbie, Abgar Read Ailín Frederick William Robertson, John Gerard Holmes John Charles Gallan Noelle Long Richard Wood Power Russell Warren William Swirles Allardyce and James Sinclair Quin (equal) John Coolican and Thomas Madill (equal) Becher FitzJames Haythornthwaite Albert Hugh Thompson Victor George Walker Johannes Tobias Myhrhelt and Cecil Quinlan and Richard William Shaw (equal) William Joseph Hogan Alfred Beckett Louis John Murphy (Physiology completing examination), and Richard Dominick Murphy (Physiology only)

INTERMEDIATE MEDICAL EXAMINATION PART II

Applied Anatomy and Applied Physiology—Frederick Gill Joseph Posner Frederick William Godbey Louis John Murphy Eric Reginald Tivy Francis S. G. Batterby and Cecil Keller

FINAL MEDICAL EXAMINATION PART I

Materia Medica Pathology Medical Jurisprudence and Hygiene—William Robert Fearon Edward D. Arcy McGree, Thomas Scannel McDonald James Arthur William Cullen Thomas Mulock Dentley Charles Goling Ambrose Edward Francis Wilson, Paul Herbert Shelley Smith William Joseph Hamilton Meta Grace Jackson Thomas Tabuteau, Patrick Casey Herbert James Wright Percy Crowe Parr John Edmund Hill Fleetwood William Porter Sullivan (Medical Jurisprudence and Hygiene completing examination) Cedric Cowan Mccredy (Medical Jurisprudence and Hygiene completing examination) Margaret Wolfe (Materia Medica and Pathology) Arthur Leslie Gregg (Materia Medica, Medical Jurisprudence and Hygiene) Bryan Austin McSwiney (Materia Medica, Medical Jurisprudence and Hygiene) and David Shields Prentice (Materia Medica, Medical Jurisprudence and Hygiene)

FINAL MEDICAL EXAMINATION PART II

Surgery (B.Ch.)—Thomas Paul Chapman Andries Adriaan Louw Albertyn Charles Henry Comerford John Armstrong Crozier Kidd, Philip Augustus Hall and Edward Oswald Marks (equal) Rupert Montgomery Butler Gordon and Alfred Henry Price (equal) Cedric Cowan Mccredy Herbert Stratford Collins, Thomas Stanton Violet Mabel Deale Sydney Verner Furlong Robert William Pritchard Charles Owen James Young Marie Annette Hadden and Edward Lipman and Crosbie Weir (equal) Esther Violet Adderley and Herbert James Wright

Medicine (M B)—Charles Henry Comerford David Roderick Hennessy Charles Lewers McDonogh Philip Augustus Hall Thomas Joseph Lane Andries Adriaan Louw Albertyn, Edward Oswald Marks Louis Blumberg and Thomas Stanton (equal) Thomas Galvin Roche Crosbie Weir and Charles Owen James Young (equal) and Alfred Henry Price
Midwifery (B A O)—Thomas Joseph Lane Frederick John Murphy James Carter Ogilvie and William Frederick Wicht (equal) Andries Adriaan Louw Albertyn, John Philip Macnamara, Alfred Henry Price, Charles Owen James Young Edward Oswald Marks and Robert William Pritchard.

INTERMEDIATE DENTAL EXAMINATION

Anatomy and Physiology—Irene Dorman
 The following medals, prize, and scholarship were awarded—Cunningham medal (Anatomy), Cecil Emrys McQuade Purser medal (Physiology) Noelle Long and James Sinclair Quin (equal) Fitzpatrick prize, Thomas Joseph Lane Medical scholarship (Anatomy and Physiology), Johannes Cornelis Fouché

Sir Clifford Allbutt, K C B, celebrated his 80th birthday last week and received a presentation from the members of the medical profession at Cambridge

MEDICAL MAGISTRATE—Dr E N Burnett has been appointed a justice of the peace for Newcastle

ROYAL MEDICAL BENEVOLENT FUND—At the last meeting of the committee held on July 11th 32 cases were considered and £264 granted to 26 of the applicants A summary of the cases relieved will be given in a later issue

THE BELGIAN DOCTORS' AND PHARMACISTS' RELIEF FUND—The following subscriptions have been received since the publication of our last list—

	£ s d		£ s d
Mr A. Chapman	0 11 9	Society of Apothecaries of London	
Mr L. E. Thomas	0 19 9	(second donation—	
Dr G. D. H. Carpenter		total £150)	100 0 0
(fifteenth donation—total £15)	1 0 0		

Subscriptions to the Fund should be sent to the treasurer of the Fund, Dr H A Des Vœux, at 14, Buckingham gate, London, S W, and should be made payable to the Belgian Doctors' and Pharmacists' Relief Fund, crossed Lloyds Bank, Limited

OXFORD OPHTHALMOLOGICAL CONGRESS—The seventh annual meeting of the Oxford Ophthalmological Congress was held on July 13th and 14th at Oxford, the Deputy Master, Captain P H Adams, R A M C (T), presiding The members of the congress were accommodated at Keble College, whilst the scientific work of the congress was carried on in the department of human anatomy, kindly lent for the purpose by Professor Arthur Thomson Considering the circumstances the attendance was good A discussion on the Relationship of Ophthalmology to General Medicine was opened in the morning by Sir William Osler, who dealt with the subject clinically The following contributed papers Mr Walter H H Jessop, Captain Adams, Dr F E Batten, Mr J Gray Clegg, Lieutenant Colonel W H W Elliot, Dr Tyson Mr J Hern, and Captain Stack In the afternoon Sir Anderson Critchett reopened the discussion and dealt with the subject from a more general point of view Mr Harrison Butler, Mr A J Ballantyne Mr J Jameson Evans, and Mr Leighton Davies contributed papers, and papers by Dr James Taylor and Dr M McNaughton-Jones were read in their absence

The morning of the second day was given up to addresses and demonstrations as follows—An address by the Master, Mr Sydney Stephenson who was unavoidably absent, on the Diagnostic Value of Tubercle of the Choroid, Lieutenant-Colonel Elliot Treatment of Ophthalmic Diseases by Indigenous Methods in India, Mr Stephen Mayson lantern slides showing some Orbital Tumours, and Mr Harrison Butler (a) Some Remarks on Spring Catarrh (with lantern pictures), and (b) the Result of Squint Operations During the morning a resolution was brought forward and unanimously passed, to the effect that the congress were of opinion that all workers exposed to danger from flying particles with especial reference to those engaged in munition factories should be provided with and encouraged to wear suitable protective goggles The afternoon was spent at the Eye Hospital, where a good number of interesting cases were shown by Captain Adams Mr St Clair Roberts, and Mr Harrison Butler Short communications were made by Mr F Wood White and Mr F W Sydenham The proceedings concluded with a demonstration at the Ratcliffe Infirmary by Major Tarrell R A M C (T) on the electrical treatment of warts and naevi

The scientific museum, which was open throughout the meeting, contained some excellent demonstrations amongst which the collection of paintings illustrative of tubercle of the choroid by Mr Sydney Stephenson attracted special notice as did those showing fundus conditions in various diseases by Mr Ballantyne Dr F W Edridge Green gave demonstrations on binocular vision and various

subjective phenomena connected with the retina and their explanation in the theory of vision, and Mr J A Menzies demonstrated the value of the Simpson light in the treatment of scar tissue in the cornea Pathological specimens were shown by Captain Adams, Mr Gray Clegg, Mr Ballantyne, Mr Norman Pike, and Mr A B Oridland A commercial museum was given room in the same building, and afforded good opportunity for the examination of the apparatus and instruments

At the conclusion of the discussion on Thursday the Deputy Master and Mrs Adams invited members and their friends to tea at 53, Broad street, and at 8 P M the official dinner took place in the hall of Keble College, the Warden presiding

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS

Mesopotamia and the Dardanelles

A Bill has been introduced into the House of Commons by Mr ASQUITH to constitute two special commissions to inquire into the conduct of the operations of war in the Dardanelles and in Mesopotamia respectively

On the debate on the second reading of the Bill on Wednesday, Mr ASQUITH announced that the Commission of Inquiry into the operations in Mesopotamia would be composed of Lord George Hamilton (chairman), Lord Donoughmore, Lord Hugh Cecil, M P, Sir Archibald Williamson, M P, and Mr J Hodge M P The proposed constitution of the Dardanelles Commission is—Lord Cromer (chairman), Mr Andrew Fisher, Sir Thomas Mackenzie Sir F Cawley, M P, Mr J A Clyde, K C, M P, and Mr Stephen Gwynn, M P

Reports of Certifying Surgeons

The Police, &c (Miscellaneous Provisions) Bill has passed through Committee in the House of Lords In the course of the proceedings in Committee Lord LATYMER moved, as an amendment, to omit the clause which abolishes the investigation of accidents by certifying surgeons except in specified cases After some discussion the amendment was negatived by 40 votes to 7 The clause was therefore retained.

HOUSE OF COMMONS

WEDNESDAY, JULY 19TH

Medical Treatment of Discharged Wounded Soldiers

Mr HUME WILLIAMS asked the Financial Secretary to the War Office whether soldiers discharged from the Army with a pension on account of wounds were left to pay, out of their pension, for any subsequent medical treatment that the wounds might require, and if so, whether provision would be made for gratuitous treatment for discharged soldiers in so far as they suffered from the direct effect of wounds received in the war—Mr FORSTER answered Soldiers discharged from the Army on account of wounds can, on application to the Secretary of the Royal Hospital, Chelsea, obtain treatment in a military hospital, provided there is a reasonable probability that their disability will be cured or materially improved thereby While in the hospital their pension is raised to the full amount allowed for total disablement, and any allowance borne before discharge to which they may be entitled A stoppage of 1s per day is made for maintenance while they are in hospital

Mr HUME WILLIAMS Could not the same arrangement be made applicable to people in country districts who cannot get up to Chelsea Hospital?—Mr FORSTER Yes, the same arrangement would apply, and accommodation would naturally be found for them in the most convenient military hospital

Mr HUME WILLIAMS Where ought they to apply?—Mr FORSTER Apply by letter to the Secretary of the Royal Hospital Chelsea

Mr WARDLE Is it the practice of the War Office to discharge a man who is suffering from wounds before being admitted to a hospital?—Mr FORSTER No, these are cases where the wound breaks out afresh, or some further disability arises after discharge

THURSDAY, JULY 20TH

Control of the Sale of Cocaine

Sir JOHN LONSDALE asked the Home Secretary whether he was now in a position to say what steps were proposed by the Government to deal with the sale of cocaine—Mr HERBERT SAMUEL replied The sale of cocaine to any member of the Forces is already prohibited by Order 40 of the Defence of the Realm Regulations Further steps how this drug which is now prevalent and I am proposing to obtain at once an extension of the Regulations to enable the Government to control the sale of the drug generally

Colonel NORTON GRIFFITHS Did not the right honourable gentleman promise to take active steps in reference to the matter some time ago in answer to a question of mine?—Mr SAMUEL It has taken a little time to elaborate the form of the Regulation. It is completed, and I am awaiting a meeting of the Privy Council in order to secure its enactment.

Acute Mental Cases in the Navy

Commander BELLAIRS asked the Secretary to the Admiralty whether he was aware that the experience of the war had shown that acute mental cases could not be adequately treated in general wards, and whether the fact that mental cases were distributed in the wards meant that there were no acute mental cases in the Royal Navy.—Mr MACNAMARA wrote in reply Cases of neurasthenia and acute mental cases are quite distinct and are treated by different methods. Cases of the former are treated in general medical wards with excellent results up to the present. Acute mental cases are treated in the special mental wards that are provided in our three large naval hospitals. The increase in the percentage of acute mental cases in the Navy since the war began has not been very great.

Commander BELLAIRS asked for what length of time mental and neurasthenic patients were treated in naval base hospitals before being invalided out of the service as incurable.—Mr MACNAMARA replied No definite time can be stated for which mental and neurasthenic patients are treated before being invalided as incurable. The time of treatment depends entirely on the type of cases, and as regards insanity particularly the question arises whether a patient is not more likely to recover in Yarmouth than in a general hospital. Generally speaking, it may be said that patients are not invalided until there is no chance of recovery within a reasonable time, or until it is evident that hospital treatment is doing no good.

Commander BELLAIRS asked what provision was made in the case of those who had been sent home to their relatives with so-called nervous breakdown, or neurasthenia, and whether consideration was given in cases where there was a relapse which necessitated closer supervision than relatives were able to give.—Mr MACNAMARA answered If the disability is attributable to the service a pension under the War Disablement Scale is awarded in accordance with the earning incapacity when discharged (if totally incapacitated the rate is 25s a week), with allowances in respect of children and the usual additions for badges, medal, and petty time. If not attributable the pension or gratuity to which the man is entitled in respect of his service is awarded, a life pension being awarded for more than 10 years' service. As to the second part of the question, if the disability is attributable the urgent cases in which the treatment required is of a temporary nature are received again into a naval hospital.

Deaths from Heat-stroke in India

Answering questions which were put by Major ASTON relating to deaths amongst Territorials from heat-stroke in India, Mr CHAMBERLAIN (Secretary for India) wrote I have received telegrams from the Viceroy on this subject. On June 15th the Viceroy telegraphed as follows—

"We regret to report 50 cases, with 12 deaths, from heat-stroke occurred amongst drafts ex hired transport *Ballarat* on the train journey between Karachi and Lahore. Troop train left Karachi June 5th with 13 officers and 1013 men. On reaching Rohri 32 men were removed to Civil Hospital, Sukkur, suffering from heat-stroke, of whom 12 died, and 18 more cases occurred before train reached Lahore. Train carried three medical officers, had two second-class carriages, fitted up as hospitals with fans and was provided with coffee shop and good supply of ice, no overcrowding. 30 men in four wheelers and 60 in bogies, normal carrying capacity for troops is 36 and 72 respectively. Arrangements have been made to send to hill depôts all men who have been suffering from the rail journey. Orders have been issued stopping all further movement of troops by rail from Karachi to Northern India. A complete report of the occurrence will be furnished at an early date."

A further telegram on June 19th added that the total number of heat stroke cases was 136, with 15 deaths. All sick reported doing well. On July 15th, in reply to further inquiry, I received the following telegram—

In reply to your inquiry dated July 11th Karachi was selected as the port of disembarkation as the majority of the drafts on board the *Ballarat* were for units in the 4th, 1st and 2nd Divisions—namely, Quetta, Peshawar, and Raval Pindi. Drafts for the Lucknow and Mhow Divisions disembarked at a later date."

To-day I have received a further telegram as follows—

"With reference to the inquiries in your telegram dated July 14th the case is being investigated by a senior officer from Army Headquarters and a specially selected medical officer. They left for Karachi on the 7th inst with instructions to visit all stations along the line where fatalities occurred, collecting evidence, and submitting a full report as

soon as possible after their return to Simla about the 28th instant."

Leprosy as a Notifiable Disease

Answering Mr BURGON, who asked whether he would consider the desirability of scheduling leprosy as a notifiable disease, Mr LOVE (President of the Local Government Board) said The question whether it is desirable to make the disease notifiable is under consideration. I may add, however, that the number of cases of this disease in this country is extremely small.

Tuberculosis in Ireland

Mr PATRICK MEEHAN asked the Home Secretary whether he was aware of the need for adequate provision for patients in advanced infectious stages of tuberculosis in Ireland, whether he was aware that the effectiveness of the work of the local committees was seriously hampered by such cases spreading infection, and whether immediate steps would be taken to secure proper provision for such cases.—Mr HERBERT SAMUEL answered The importance of securing the isolation of patients in an advanced stage of tuberculosis has been duly recognised by the Irish Local Government Board, who had lost no opportunity of bringing the subject to the attention of the county councils. The matter, however, is complicated by the necessity of affording accommodation for such cases in reasonable proximity to their homes as well as by difficulties of finance and management which would result from the establishment of numerous specialised institutions. The recommendation which the Board has addressed to all the county councils has proceeded on the lines of the affiliation of the union isolation hospitals for this purpose by means of their transfer from the boards of guardians to the sanitary authorities and their subsequent adaptation for the reception of advanced tuberculosis patients. This suggestion is receiving attention.

Mr MEEHAN asked the right honourable gentleman whether the Local Government Board had yet adopted a scheme for the domiciliary treatment of tuberculosis patients in Ireland, whether he was aware that the Local Government Board suspended the domiciliary part of schemes adopted by county committees in Ireland pending the preparation of an All Ireland scheme, and whether, in the event of an All Ireland scheme not being put into operation at once, the Local Government Board would permit county committees who had adopted domiciliary schemes of their own to put such schemes into operation at once.—Mr SAMUEL replied Domiciliary treatment of tuberculous patients is being carried out under the schemes of a number of county councils, but the Irish Local Government Board have advised the councils to proceed tentatively in this matter pending the complete organisation of their dispensary arrangements. In a few instances the Board in accordance with instructions from the Treasury, by whom half the net cost of approved schemes for the treatment of tuberculosis is recouped, have taken exception to a monetary allowance for the purchase of ordinary subsistence for a tuberculous patient under domiciliary treatment.

Mr MEEHAN Is the right honourable gentleman aware that the domiciliary treatment of patients costs 10s. as against a much larger amount per week for sanatorium treatment, that there are a number of cases in Ireland which are fit for home treatment, and whether this scheme of the Local Government Board will be put into operation at once?—Mr SAMUEL I will bear in mind what the honourable Member has said.

Medical Arrangements in Mesopotamia Sir Victor Horsley's Letters

Mr ASQUITH (Prime Minister) announced that the Government had decided to institute statutory inquiries into the conduct of the campaign in Mesopotamia and of the expedition to the Dardanelles.

In the course of a debate on the motion for the adjournment, in which the need for those inquiries was urged, Sir NORVAL HELME desired assurances that information would be welcomed by the tribunals to be set up. He went on to say My reason for asking the question is that yesterday, when Lady Horsley heard of the lamented death of her husband, who sacrificed his life in the public service, having left Egypt to go to Mesopotamia to overlook the medical interests of the expedition there, she desiring to contribute, so far as she was able, to that inquiry entrusted me with letters and extracts from her husband's letters bearing upon such matters as transport medical supplies, the lack of water and so on, in respect to that important enterprise. Seeing we are to have this inquiry conducted, I rose to say how anxious I was that there should be a clear understanding given to Members of this House or to the public generally having information bearing upon the conduct of that campaign that that information would be welcomed by His Majesty's Government, that we should have the opportunity of putting such facts as come within our knowledge before the Government. I do not presume, under present

circumstances, to say more I feel however, it is right that I should acknowledge the indebtedness I feel to Lord Horsley in the said circumstances. If in the debate to-day any facts in the correspondence of her late husband could be of use to or at the service of the House she was anxious that it should be of the public interest was thereby aided.

Mr MALCOLM in urging the necessity of immediate inquiry, referred to the stock of drugs and dressings that had been kept in India. He said that the Director-General of the Indian Medical Service long ago pressed upon the Army Finance Department that it would be difficult in the case of a big war to get the necessary drugs and dressings from England. Five years before the war the Army Finance Department set its face against a project for the manufacture of medicines in India, and tried to starve it out, but the concern being able to supply local governments and civil departments with drugs, became a success.

Colonel YATE spoke of the account he had received of the inadequacy in the equipment of the hospitals.

Mr ARNOLD BRUCE said that officers who had come home described in the most moving terms the misfortunes that arose from the want of hospital accommodation and supplies.

Mr LLOYD GEORGE (Secretary for War) said that the inquiry must be a searching one. Meanwhile care had to be taken that the Force in Mesopotamia was properly equipped, and that the state of things complained of by honourable Members could not occur again assuming what they had stated were facts. The War Office had now assumed responsibility for the future of the campaign. Generally whenever there had been a requisition from the Government of India to the War Office whether in respect of ordinary supplies or for the sick and wounded it had always been honoured.

Sir JOHN JARDINE: Do those requisitions include those for medical officers?

Mr LLOYD GEORGE: Certainly several were requisitions for medical officers, which have been honoured.

Sir JOHN JARDINE: From this country?

Mr LLOYD GEORGE: Yes from this country. Sometimes the assistance had been secured from the Force in France more especially he thought with regard to assistant doctors—a class peculiar to India and which had its training there. There was no doubt at all that in a way was not a very satisfactory arrangement. The War Office had the responsibility for directing operations, the Commander in Chief had the responsibility for supplies and the main responsibility for supplies must always remain with him because the only possible base of supplies so he (Mr Lloyd George) was advised, must be India. The Government felt that if the War Office was to be responsible for the direction of the operations it must also accept direct responsibility for the supplies as well, including the arrangements for the sick and wounded and the transports and this arrangement had been come to with the Government of India that whilst India remained the base for the Forces in Mesopotamia and that Force continued to be administered by the Commander in Chief in India the Commander in Chief would receive his instructions from and be responsible to, the Army Council in regard to all matters of personnel, administration and supplies to the Force in question. The War Office would take responsibility for the transport, that being the main difficulty. The right honourable gentleman then dealt at some length with the question of river transport.

Mr MALCOLM: What are you going to do about the results of the Vincent Report? What use will that be put to?

Mr ARNOLD BRUCE: When will that report be published?

Mr LLOYD GEORGE: The Vincent Report has not arrived yet and therefore we do not know what it is. We have of course our ideas as to what it is but we have not seen it.

Mr CUTHBERT: Cannot you get it telegraphed?

Mr LLOYD GEORGE: The Commander in Chief has his own observations to make upon it and he is very anxious that they should accompany the report. It will be here in a very short time and it will be one of the first documents placed before the Commission. The right honourable gentleman proceeded to discuss other aspects of the situation. The first duty of the Government was to see that things were put right. The second duty was to see if anyone had been responsible for negligence if anyone through his negligence had inflicted pain and torture upon the gallant men who had tendered their lives to their country and who through their great deeds had made honourable Members proud of the race to which they belonged, that those men should be held to account.

Mr DILLON said that statements had been laid before him which went to show that the medical provision made for the troops was absolutely scandalous. No adequate attempt was made to furnish the troops with drugs or with river transport and the supply of medical men and medical ordnance was shockingly insufficient.

Sir HENRY CHAIR: I am sorry that I have been told by medical men how bad the state of things had been in Mesopotamia. He urged that the Vincent Report ought to be a once made public and that it ought not merely to be submitted to the inquiry which the Government had announced.

MONDAY, JULY 24TH

Deaths in Troop Train in India.

Replying to Sir CLEMENT KINLOCH-COOKE, who asked a question relating to the deaths in a troop train in India, Mr. CHAMBERLAIN (Secretary for India) said: I have directed the Government of India that, having fixed the responsibility for this deplorable incident, they are to hold the person or persons responsible to strict account.

The Sale of Cocaine.

In reply to Major ASTOR, Mr. HERBERT SAMUEL (Home Secretary) said: As regards the sale of cocaine a medical prescription is not required under the present law. The maximum penalty for illicit sale is six months' imprisonment and a fine of £100. The new regulations on this subject, which I announced in the House recently, will be submitted, I hope at the next meeting of the Privy Council.

Mr RAFFAN: Will provision be made in the new regulations for the supply of the necessary quantities of cocaine to dental practitioners, both registered and unregistered?

Mr SAMUEL: Yes, sir, that is being done.

Mr RAFFAN: For both registered and unregistered dental practitioners?—Mr SAMUEL: I must ask for notice of that.

TUESDAY JULY 25TH

The Sale of Cocaine.

Mr RAFFAN asked the Home Secretary whether the draft regulations relating to the sale of cocaine had been submitted to medical and dental governing bodies.—Mr. H. SAMUEL answered: The Royal College of Physicians has been consulted. I am not sure that any organisation representing dentists has been consulted. I shall take that into consideration.

Appointments.

Successful applicants for vacancies, Secretaries of Public Institutions and others possessing information suitable for this column, are invited to forward to THE LANCET Office directed to the Sub-Editor not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.

HAWKSWORTH: Mr. has been appointed Deputy Acting Medical Officer to the Exmouth District for the St. Thomas (Exeter) Board of Guardians.

HORAN, Miss B. L.D.S. Edin., Dental Surgeon to the Dorset Education Committee.

LEO, GEORGE ALEXANDER, M.A. Oxon, M.D. Brux, M.R.C.S. L.R.C.P. D.P.H. Eng. Temporary School Medical Officer to the T. quay Education Committee.

MASTERMAN, E. W. G., M.D. Durh., F.R.C.S. Eng. D.P.H., Medical Superintendent to St. Giles Infirmary, Camberwell.

STRIDE, EDWIN LAWRENCE, M.R.C.S. L.R.C.P. Acting Deputy Public Vaccinator to the Exmouth District for the St. Thomas (Exeter) Board of Guardians.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index). When the application of a Belgian medical man would be considered the advertiser are requested to communicate with the Editor.

ALTON HANTS: LORD MAYOR TRELGAR CRIPPLES HOSPITAL.—Assistant Resident Medical Officer.

BEDFORD COUNTY HOSPITAL.—House Surgeon unmarried. Salary as arranged with board &c.

BIRKENHEAD CIVIL INFIRMARY.—Female Resident Assistant Medical Officer. Salary at rate of £175 per annum with board &c.

THE Chief Inspector of Factories Home Office, London, S.W. gives notice of vacancies for Certifying Surgeons under the Factory and Workshop Acts at Cliff Warwick at Clonmel, Tipperary at Grangemouth, Stirling at Millom Cumberland; and at Uffculm Devon

Births, Marriages, and Deaths.

BIRTHS

FRANKLIN — On July 19th at nursing home, the wife of E. Morris Franklin W.A.M.S. Abeokuta, Nigeria, and 20, Brightwell-avenue Westcliffe, of a son
 HALLINAN — On July 20th, at M.O. s Bungalow North Front, Gibraltar the wife of Captain J. C. Hallinan R.A.M.C. of a daughter
 LEE — On July 26th at 5 Angelsea terrace, St Leonard's-on-Sea, to James C. Lee M.D. and Ethel Lee (née Gompertz) M.B., Ch.B. — a son
 LITTLEJOHNS — On July 18th at Trevarthian terrace Stoke Deronport, the wife of Major A. B. Littlejohns R.A.M.C. of a son
 RICHARDS — On July 16th at Hyde Park mansions W the wife of Captain Owen Richards, R.A.M.C., D.S.O. of a daughter

MARRIAGES

M'GONIGLE-CAMPBELL — On July 15th at St. Matthew's Bayswater George Onthbert Mura M'Gonigle, M.D. B.S. B.Hy. D.P.H. Temporary Captain R.A.M.C. to Dorothy Evelyn, youngest daughter of the late Captain Charles Campbell and Mrs. Campbell
 PHILLIPS-JENKINS — On July 18th, at Gwaecegurwen by the Rev. R. J. Roderick George Stanley Phillips Captain, R.A.M.C. only son of Mr. and Mrs. Phillips Carmarthen to Grace Jenkins, youngest daughter of Mr. Samuel Jenkins J.P. and Mrs. Jenkins Gwngorse, Gwaecegurwen
 RICHMOND-KELLY — On July 8th, at the Consulate, Alexandria, Egypt, Captain Arthur Eaton Richmond R.A.M.C. (S.E.) to Margaret May, daughter of Mr. William Kelly, of Tuam co. Galway
 VEALE-DRURY — On July 18th, at the Private Chapel of the Palace, Ripon Rawdon Veale, M.D. Lond., Major R.A.M.C. (I.), to Frances, youngest daughter of the Bishop of Ripon and the late Mrs. Drury

DEATHS

ACLAND — On July 12th killed in action Temporary Captain John Henry Dyke Acland, R.A.M.C. aged 36 years
 BAKER — On July 20th at West Heath-drive Golders Green John H. Baker, M.D. of Bedford-square, London aged 60 years
 BURRELL — On July 22nd Lieutenant Stanley Walter Burrell, R.A.M.C. of St. Bartholomew's Hospital aged 25 years
 MICHELL — On July 20th of wounds received on July 3rd Robert Williams Michell, M.D., F.R.C.S., Captain, R.A.M.C. of Cam bridge aged 56 years
 NEWBERY — On July 14th killed in action, Richard Fenton Theodore Newbery Temporary Lieutenant R.A.M.C. attached to Northamptonshire Regiment.

N.B. — A fee of 5s is charged for the insertion of notices of Births, Marriages, and Deaths

THE MEDICAL PROFESSION IN 1816

THERE is apparently no modern thesaurus of medical anecdotes. A century ago such works were gravely sent forth from the press, and may be said to mark the last phase of the period, of which Mollère was "the prime anti medical satirist when the whole world of medicine, from grave and learned doctors down to venal apothecaries, was regarded as a fit subject for ridicule or suspicion. In 1816, according to 'Anecdotes Medical, Chemical, and Chirurgical, collected, arranged, and transcribed by an Adept,' in two volumes the physician sometimes boasted that he prescribed as well when he had drunk a great deal of wine as when sober. 'I should guess,' said the famous Dr. James Gregory, inventor of the Mixture," that it might be found in all physicians (to say nothing of the other limbs of the Faculty), who think as little what they are doing when sober, as they do, or might do when drunk." The Adept's book of "Anecdotes" is dedicated to this James Gregory (the Third, really the Fourth), a distinguished Edinburgh professor in his time, and many quotations are made from his writings, which are singularly plain spoken as to the medical ethics and practice of his time. Such criticisms by a leading physician would fortunately be impossible to-day. "Some of the medical profession," he says, "out of pure love of science, and without the least necessity, have taken small pox matter from the dead body of one who died of the worst kind of the disease, and have inoculated with it. A dead body, half putrid, has been dug out of the grave, where it had lain for some days, and small pox matter has been taken from it for the same purpose." He has the greatest contempt for medical literature. "More than ninety and nine parts in the hundred of all that has been written on the Theory and Practice of Physic, for more than two thousand years, is absolutely useless. A large proportion of those writings consists of controversies, generally carried on with the bitterest animosity." And the same he believes to be true of surgical writings. Let this writer emphasise the fact that the profession, at the end of the eighteenth century, is rising in importance. The English surgeons especially have done well, he thinks to dissociate themselves from the barbers. Medical students are cited by him as extraordinarily zealous in the pursuit of knowledge, though somewhat absurd in it. "Their debates on controverted points have often been conducted with all the violence of party spirit, within my memory, some of them fought with pistols about their medical systems, many more were eager to do the same. One zealot out of stark love and kindness, resolving to convert me came to my house on pretence of asking some questions about what I had taught in my lectures, and regaled me with a harangue, of which I understood not one fiftieth part, but which lasted near an hour, and was delivered with such vehemence of gesture and passion, that he not only sweated profusely, but literally foamed at the mouth." Yet from among these controversial young men in Edinburgh grew up the generation of the Bells and of the Listons.

THE LATE SIR CHARLES BLANE

A CORRESPONDENT writes — Sir Charles Blane, Bart., R.N., who was lost in H.M.S. *Queen Mary*, represented the family of that famous surgeon in the Navy Sir Gilbert Blane who was with Rodney in 1782 and was made a baronet for bringing the sick and wounded back from Walcheren and in 1829 founded the Blane medal given to naval medical officers who send into office the best journals of their practice.

"PATENT" MEDICINES

IN the report just issued, of the Commissioners of His Majesty's Customs and Excise for the year ended March 31st, 1915, it is explained that the Excise duties in force for medicine labels are 1s 4d, 3d, 6d, 1s, 2s, 3s, 10s, and £1, according to the price of the medicine. The net receipts from these duties amounted in 1911 to £325,646, in 1912 to £327,857, in 1913 to £328,319, in 1914 to £360,377, and in 1915 to £333,777. The licence duty levied on makers or vendors of patent medicines is 5s. The number of these licences

issued and the receipts therefrom were, in 1911, 42,697, £10 673, in 1912 43 131, £10,781, in 1913, 43,118, £10,780, in 1914, 43,156, £10,791, and in 1915, 42,731, £10,686. These figures apply to Great Britain only, neither the medicine stamp duty nor the licence duty extending to Ireland.

ACKEE

To the Editor of THE LANCET

SIR,—With reference to the investigations of Dr H H Scott, Government bacteriologist to Jamaica, referred to in an annotation in THE LANCET of July 8th, and inordinating the "ackee" as the cause of vomiting sickness, it may be worth mentioning that in West Africa, where the tree *Blighia sapida* is indigenous, the native belief is that the poisonous property resides in one portion only of the fruit, the removal of which is said to render the remainder harmless. The fleshy aril clasping the base of the large seeds is the edible portion, and in the aril the central fibrous raphé is bitter and is stated to contain the poisonous element. This bitter portion is therefore removed before eating, whether uncooked or after boiling or roasting. The Yorubas, knowing this, call the dangerous part *ishin*, meaning death (perhaps facetiously, as in the slang use of the expression "sudden death" in reference to some attractive but doubtful comestible). The Yoruba name for "ackee" is *ishin*, and tribal knowledge of the matter seems to have become crystallised in a proverb meaning "He who knows how to eat the *ishin* knows enough to remove the poison from it."

I am, Sir, yours faithfully,

J M DALZIEL,

Edinburgh, July 21st 1916 Sanitary Officer, Lagos

DIGITALIS LEAVES IN CORNWALL

SOME of the school children have been gathering the leaves of the foxglove in Cornwall. They have to be despatched the same day as gathered, and are sent to a manufacturing firm of chemists in London, who pay 12s per cwt for sound leaves of a good green colour. The railway rate is high, about 5s per cwt. The profit on the sale of the leaves goes towards the school War Charity Fund.

WANTED, A HOME

To the Editor of THE LANCET

SIR,—The widow of a naval officer, with pulmonary tuberculosis apparently arrested and a weak heart, would like to find a comfortable home. At present she is able to take care of herself, and could contribute a guinea a week towards her maintenance. I am, Sir, yours faithfully,

July 24th, 1916

R G

Logician—Where an age term is employed an actual date must be fixed—there is no possibility of recognising a physiological age. If the Local Medical War Committee is doing its work properly the abuses mentioned should not occur. Will our correspondent give categorical examples of nepotism, when a most useful inquiry might follow?

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

MANAGER'S NOTICES

THE INDEX AND TITLE-PAGE TO THE LANCET

January to June, 1916

IN view of the Government restrictions upon the supply of paper, and the shortage of paper quite apart from these restrictions, the Index and the Title-page to the volume of THE LANCET which was completed with the issue of June 24th have been printed separately, and copies have been supplied gratis to those subscribers who have, up to July 27th, intimated to us their wish to receive them. Other subscribers will be similarly supplied, so long as the stock remains unexhausted, on application to the Manager, THE LANCET Office, 423, Strand, London, W.C. Such application should please be sent in at once, direct to the Manager and not through Agents.

Volumes and Cases

VOLUMES for the first half of the year 1916 will be ready shortly. Bound in cloth, gilt lettered, price 16s, carriage extra.

Cases for binding the half year's numbers are now ready. Cloth, gilt lettered, price 2s, by post 2s 4d.

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423 Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and not to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

TO COLONIAL AND FOREIGN SUBSCRIBERS

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 4.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

Quality and Safety Assured

The Mulford Biologicals are Protected by Every Safeguard

The care taken in every step of the preparation, testing and finishing of the Mulford Biologicals safeguards their purity and activity. A special hollow tile and concrete laboratory, practically a fireproof monolith, is devoted to filtering, labeling and finishing the tested products. The building is divided into separate departments, each constituting a complete unit.

Operating Room.—The animals are bled in a special building erected and equipped with the same care as the operating room of a modern hospital. In a different group of rooms the serum is separated from the blood and placed immediately in special refrigerating rooms.

A MODEL LABORATORY DEVOTED TO FILLING, LABELING AND FINISHING THE MULFORD BIOLOGICAL PRODUCTS

After the serum is subjected to careful and rigid physiologic and bacteriologic tests, confirmed in duplicate by double and independent check tests, it is delivered to the antitoxin filling rooms.

Air Washing and Humidity Control.—The twenty filling and serum rooms are supplied with washed and filtered air, insuring aseptic conditions. Humidity and temperature are controlled, giving ideal working conditions for the employees.

Arrangements for Visitors.—Glass partitions between the halls and working rooms permit the demonstration of the work to visitors.

The Unit System.—The Mulford Laboratories are arranged and managed throughout under the unit system. Separate buildings and departments are devoted to the preparation, standardization, packing and shipping of each product. Each unit is in charge of an expert in the particular branch. Special refrigerating rooms, supplied with cold air from a central plant, form an important part of each individual unit. This makes it possible to carry a large stock of biologicals without any danger of deterioration, so that at all times the laboratories are prepared to meet the demands created by epidemics.

Containers.—The Mulford Antitoxin and Bacterin glass syringes, together with special apparatus employed in experimental work, are manufactured in the glass factory located within the laboratory grounds.

ADRENALINE CLIN

(HYDROCHLORIDE)

Adrenaline Clin crystallized chemically pure, corresponds to the formula $C_9H_{17}NO_3$ (according to Farth Stolz Jowet and Bertrand) It presents all the properties that characterize substances of definite chemical composition so that it is possessed of maximum activity and absolute uniformity of physiological action and therapeutical effects

SOLUTION of ADRENALINE CLIN

1 in 1000

In phials of 5 and 80 cc.

COLLYRIUM of ADRENALINE CLIN

1 in 5000 and 1 in 1000

Drop bulbs of 10 cc.

Combinations: COLLYRIA CLIN, Adrenaline-Cocaine and Adrenaline-Eserine.

GRANULES of ADRENALINE CLIN

1/4 milligramme each.

SUPPOSITORIES of ADRENALINE CLIN

1/2 millig, each

CLIN STERILISED TUBES

of 1 cc. for hypodermic injection

ADRENALINE (hydrochloride) alone 1/2 and 1/10 mg per cc. (Box of 10 tubes)

ADRENALINE in combination (COCAINE, STOVAIN, ALYPINE) in boxes containing 6 or 12 tubes

Observations

THE DEVELOPMENT OF THE REGULATION OF TEMPERATURE AND ITS CLINICAL SIGNIFICANCE

B. M. S. PEMBREY, M.A., M.D. OXON.,
LECTURER OF PHYSIOLOGY, GUY'S HOSPITAL, ETC.

A WARM BLOODED animal is distinguished from a cold-blooded one by its capacity to maintain the internal temperature of its body at a level which is almost the same in the depth of winter as in the height of summer. This power of regulation is not possessed by all animals and is not developed equally among the warm blooded animals; its evolution can be traced in the animal series and in the individual bird or mammal during its passage from immaturity to maturity. Some mammals such as the hibernating animals, have retained some of the characteristics of their cold blooded ancestors, for during the winter they become torpid and pass into a cold blooded condition. Upon these points the data which have been collected within recent years have yielded most interesting evidence in support of the Darwinian theory of evolution.

REGULATION OF TEMPERATURE IN VARIOUS CLASSES OF ANIMALS

A rudimentary power of regulation is found in several groups of the cold blooded animals. Insects as a class are cold blooded, but many observations have shown that bees in a hive can maintain a temperature considerably above that of the external air. Vipers and pythons may have a temperature ten degrees above that of their surroundings. The lowest mammals the monotremes, possess only an imperfect power of maintaining their temperature at a constant level, the average temperature of the echidna and ornithorhynchus is 29.8°C (85.6°F.) when the air is 15° (59°) and shows a considerable variation when the temperature of their environment is changed, the echidna hibernates for a period of four months. A farther link between the two great groups of animals, the cold blooded and the warm blooded, is found in those higher mammals such as the marmot, dormouse, hedgehog, and bat which hibernate during the winter, they have acquired the power of regulating their temperature but at the same time have retained some of the physiological characteristics of their cold blooded ancestors. The temperature of these animals is inconstant, even during the summer and in winter, when they are torpid, surpasses but little that of their surroundings.

The temperature of newly born pups, kittens, rabbits and rats falls when they are removed from the warm surroundings afforded by their dam and continues to fall until it reaches a point a few degrees above the temperature of the air. Newly born guinea pigs, on the other hand, are able to maintain their temperature if the exposure to cold be not excessive, they are at birth in a condition of great development, they are well covered with fur, their eyes are open and they are able to run about. On these grounds the young offspring of warm blooded animals can be placed in two classes—those which at birth are blind and helpless in some cases naked and unable to regulate their temperature and those which are born in a condition of greater development and capable of maintaining the heat of their bodies at a fairly constant level. Young birds can be classified in a similar manner the pigeon is an example of the former, the chick well represents the latter class. The members of the first class respond to changes of external temperature in a manner similar to that of the ordinary cold blooded animal. Their combustion as measured by the output of carbon dioxide varies with and in the same direction as the temperature of their surroundings. The representatives of the second class increase their combustion when they are exposed to cold; they resemble warm blooded animals. The development of this power of

regulating the temperature of the body by appropriate variations in combustion can be traced in the embryo chick. In infants this capacity is imperfectly developed at birth, and evidence will be given later that this applies to the regulation of the loss as well as the production of heat.

The evolution of the warm blooded animal has been traced, but the nature of any structural changes which are essential for the transition from the cold blooded stage is unknown. The search after gross morphological differences would appear to be a fruitless one, for the capacity to regulate temperature may be suspended and restored under natural conditions of hibernation, and by its very nature can be studied only in the living animal. Observations of physiological as well as pathological conditions indicate that the most important factors are the coördination of the nervous control over the skeletal and vascular muscles in response to sensations of heat and cold.

FACTORS CONCERNED IN REGULATION OF TEMPERATURE.

The nature and value of the factors upon which an animal's capacity to regulate its temperature depends must now be considered. Life in all organisms, whether they be animal or vegetable, simple or complex, is accompanied by chemical change and the production of heat. The living tissues require a high internal temperature for the due manifestation of their activities, the warm blooded animals maintain this favourable condition by a constant struggle against cold and heat, the cold blooded animals have not acquired this property, and within limits the activity of their tissues depends upon the external temperature. Both of these conditions are advantageous to the respective groups of animals in the struggle for existence; the warm blooded animals are able to live a more ardent life, unbroken by long periods of inactivity or torpor, and within wide limits independent of the temperature of their surroundings. The constant exercise of the different organs of the body especially of the nervous and muscular systems, must lead to greater development of the nervous system, and with it the intelligence of the warm blooded animal. On the other hand, the food supply of the cold blooded animals depends upon the external temperature, a period of torpidity, therefore, in which the activities of the tissues are reduced to the lowest ebb consistent with the retention of life, tides the cold blooded animal over the winter when the food is scarce and prolongs its life beyond one brief summer.

The heat of an animal will remain at a constant level when the loss and production of heat balance. Combustion can be augmented or diminished only within certain limits, it is economical, therefore for the superior animal that he should be able also to control his temperature by variations in the loss of heat from his body. The development of the latter power depends upon the increasing control exerted by the nervous system upon the body in response to sensations of heat and cold, this is seen in the attitude assumed, the vascularity of the skin, the activity of the sweat glands, and the ventilation of the lungs.

It is in the regulation of the production of heat that one of the most difficult physiological problems is found. How is it that the higher animals are able to struggle successfully against the general law, that cold diminishes and heat increases chemical activity? The cells of warm blooded animals are not exempt from this law, for isolated from the nervous control of the animal they respond to heat and cold in a manner similar to that seen in typical cold blooded animals. In the healthy body of the higher animals the chief cells are not put to this test, they have their own internal environment and are not subject to fluctuations in the external temperature for in response to the sensation of cold the central nervous system causes the glands, and especially the muscles to produce more heat, on the other hand, a sensation of heat results in diminished activity of those organs. The voluntary muscles are the most important sources of heat for not only are they the seat of great chemical changes during contraction, but they form between 40 and 50 per cent of the weight of the body. The regulation of the production of heat demands the constant control of the central nervous system over the skeletal muscles.

THE CENTRAL NERVOUS SYSTEM AND TEMPERATURE REGULATION.

The dependence of the temperature of the warm blooded animal upon impulses passing to and from the central nervous system is apparent from a consideration of the

means whereby the power of regulating temperature can be diminished, suspended, or abolished. Such means are (1) sleep, (2) hibernation, (3) anæsthetics, (4) alcohol, (5) curare, and (6) lesions of the central nervous system.

1 *Sleep*—When nervous and muscular activity are reduced to the natural minimum during sleep the temperature of a healthy man falls to its lowest point. The chief factor in the daily variation in temperature is the alternation of a day of activity with a night of rest, a reversal of the ordinary routine, the turning of night into day, brings with it a corresponding change in the temperature. In nocturnal birds the temperature rises during the night and falls during the day. Muscular activity signifies increased production of heat. There is evidence, however, that during sleep the capacity to regulate temperature is diminished, and this appears to apply to both heat and cold. Extremes of external temperature are less bearable during sleep, as shown by the fact that a man sleeping in his clothes finds it too cold in winter and too hot in summer. This diminished capacity appears to be one of the factors to account for the frequency of night sweats, especially in children, and of cases of heat stroke at night.

During the deep sleep which follows fatigue the sensitivity of the nervous system is so reduced that the regulation for extreme cold fails, the unconsciousness of sleep gradually passes into the unconsciousness of collapse, and the man dies "frozen to death," it is said, but in reality killed long before his temperature falls to zero. The activities of the tissues, once the nervous control is lost, are reduced by cold, there is less and less chemical change accompanied by the production of heat, and at an internal temperature about 20° (68°) life ceases. Experience has too often shown that the weary traveller who gives way to the imperative desire to sleep upon the line of march is doomed to death when there is no protection from extreme cold.

2 *Hibernation* is the only natural condition in which the suspension of the capacity to regulate temperature can be traced in all its stages. During torpidity the mammal responds to changes in the external temperature in a manner similar to that seen in a cold blooded animal.

3 *Anæsthetics*—In deep anæsthesia the activities of the body are reduced so profoundly that the production of heat is diminished. The influence of the anæsthetic is manifested especially on the central nervous system. Sensations of heat and cold no longer arise, or should they arise no longer reflexly produce decreased or increased activity of the skeletal muscles or the muscles of the blood vessels. Control over both production and loss of heat is lost. The internal temperature of animals anæsthetised by chloroform, ether, or chloral will fall to 22° (71.6°) when they are exposed to moderate cold, and it is the cold rather than the drug which brings about a fatal issue. Although such animals may have in their fur a good protection against loss of heat their temperature falls, they can no longer assume the natural coiled posture which diminishes the loss of heat, and owing to their muscular inactivity they produce far less heat. The combustion in the body can be measured by a determination of the respiratory exchange, this is reduced during anæsthesia, even if the external temperature remains the same, and much more so if the surroundings become colder. The response of the anæsthetised mammal to heat and cold resembles that of a normal cold blooded animal.

4 *Alcohol* causes a fall in temperature, not, as is popularly believed, an increased heat of the body. It is true that after drinking alcohol there is a feeling of increased warmth, but this is due to the greater vascularity of the skin and the activity of the sweat glands. Alcohol appears to act in two ways, in ordinary doses it has little or no effect on the production of heat in the tissues, but increases the loss of heat by causing the cutaneous vessels to dilate, stimulating the sweat glands and quickening the circulation. The normal reaction to cold increased production of heat and constriction of the blood vessels of the skin, is partly paralysed by large doses of alcohol, with the result that drunkards exposed to cold are quickly "frozen to death." Poisonous doses may cause a fall of 5 or 6 or even 10° centigrade, many of the lowest temperatures recorded in man have been observed in drunken persons exposed to cold. On the other hand, the disordered regulation of temperature produced by heavy drinking may show itself in a rise of

temperature during work in, or exposure to, a hot and moisture laden atmosphere.

5 *Curare* paralyses the voluntary muscles and thus deprives the warm blooded animal of its control over the chief seat of the production of heat. The curarised animal resembles a cold blooded animal.

6 *Lesions of the central nervous system*—Much controversy has arisen concerning the nature of the effects produced by injuries of the nervous system. Different observers have found that lesions apparently similar have caused in some cases a rise, in others a fall of temperature. The controversy has continued for over a century, since the observations and experiments of Benjamin Brodie in 1811, but it would be an unnecessary task to attempt to review all that has been said and done upon the subject. Fortunately this can be avoided without throwing discredit upon the discordant results obtained by different observers, for in many cases it can be shown that different external conditions produce opposite results in the temperature of the body.

The consideration of this complex subject will be facilitated by an examination of the effect produced by lesions localised in the different parts of the nervous system. The cerebrum has been removed from pigeons and dogs and the animals have been kept alive for months. The capacity to regulate the temperature is not lost, the animal shows a daily curve in its temperature, responds appropriately to sensations of heat and cold, but cannot maintain its temperature perfectly if it is left for long in a cold room. In these animals, it is important to remember, the motor and sensory paralysis produced by the operation is relatively small. In man the temperature of anencephalic monsters does not appear to have been investigated in detail, but there is on record the case of an infant, 8 months old, in whom the cerebral hemispheres were absent owing to a congenital defect, in this case the temperature remained constant during the two months or so that the infant was under observation in the hospital and no disturbance in regulation was noted.

Injuries to the corpus striatum and the optic thalamus produce so frequently a disturbance in temperature that these ganglia have been described by many observers as the special "heat centres" which regulate the production and loss of heat in the body. There are difficulties in this localisation. The corpus striatum is a prominent organ in all the vertebrates, the cold blooded as well as the warm-blooded, phylogenetically it is a very old structure, the basal portion of the fore brain. The optic thalamus is a part of the inter brain, and at one stage in the development of the vertebrates it appears to have served with the corpus striatum as a brain. In the mammals the function of the corpus striatum is obscure, but according to Hinzler Wilson, it exercises a steady effect on the action of the cortico spinal system by means of the lenticulo rubro-spinal system or more indirectly by the optic thalamus and its cortical connexions. In the dog the corpora striata and parts also of the optic thalami were removed with the cerebral hemispheres by Goltz, the animal lived for a long time, and its capacity to regulate its temperature, although diminished in range, was not lost. Similar results have been obtained by other observers. Removal of the mid brain as well as the fore brain destroys the capacity to regulate temperature. It would appear that punctures or lesions of the corpus striatum have an augmentor or an inhibitory effect upon the incoming and outgoing nervous impulses which are concerned in the reception of sensations of heat or cold and in the coördination of the activity of the various organs of the body, especially the skeletal muscles and the muscles of the blood vessels. In agreement with this view is the fact that lesions of the crura cerebri and pons may be accompanied in some cases by a rise in others by a fall in the temperature of the body.

After complete transverse section of the spinal cord the temperature may rise above the normal (hyperthermia) fall below the normal (hypothermia) or remain at the normal level according to the site of the lesion and the external conditions, but in all cases the capacity for regulation is impaired. In a paraplegic animal the anterior portion of the body responds to changes of external temperature in the manner characteristic of a warm blooded animal, the posterior or paralysed portion, on the other hand responds to such changes as does a cold blooded animal. The effect

observed when the external temperature rises or falls is the resultant of these opposite tendencies. In the paralysed parts there is no control over the production and the loss of heat, the production rises and falls with the temperature.

The experimental evidence supports the view, already suggested by the development of the power of regulation, that the capacity is not accompanied by the appearance of any special structure in the animal but is associated with the control of the nervous system over the muscles and glands and with increased sensibility to changes of temperature. There is no satisfactory evidence of the existence of special 'heat centres'.

THE CLINICAL SIGNIFICANCE OF THE DEVELOPMENT OF THE REGULATION OF TEMPERATURE.

In clinical work little attention has been paid to the development of the nervous control over the temperature of the body, although there are many problems upon which it would throw light. A few examples may be given.

Points in Relation to Infants and Children

Infants show no daily variation in temperature during the first few days after birth, for they have no definite periodicity, rest during the night and activity during the day. For a similar reason the healthy young infant has a smaller range of temperature than that seen in a young child or adult. At birth it does not possess the power of maintaining a constant bodily heat and its temperature will fall if it be exposed to moderate cold. It needs warmth and the most appropriate is that supplied by the mother's body, snug in bed in its mother's arms it is kept warm for the temperature of the mother's skin is about 35° (95°) and the air under the bedclothes may be as high as 30° (86°). The infant needs mothering and instinct is a safer guide than the smattering of science which teaches that the newly born child should be taken away from its mother in order that it may breathe purer air, not worry its mother nor run the risk of being overheat. The infant requires warm surroundings for before birth it was protected against the loss of heat by the temperature of the uterus 37° (98.6°) or thereabout, it is less sensitive than the adult to slight changes in the gaseous composition of the air it breathes for during foetal life it maintained its gaseous exchange with the mother's blood in which the pressure of oxygen is below and the pressure of carbon dioxide greatly above that of the corresponding gas in the air. The danger of overlying arises almost entirely from drunken mothers and is much less serious for the race than the undermining of maternal instinct.

The regulation of the loss as well as the production of heat is imperfect in the infant, especially if it be a weakling. Even when it is well clothed and kept in a room at 15.6° (60°) it may have a rectal temperature as low as 34° (93.2°) and may not show an appropriate response when it is sponged. The vernix caseosa is a protection against excessive loss of heat and injury of the delicate skin notwithstanding the fact that it is regarded by the nurse as dirt to be removed as soon as possible by hot water and soap. The old fashioned way the smearing of the body with oil has much evidence in its favour. In premature infants the use of incubators for their rearing is a recognition of their incapacity to maintain their temperature, as in the case of cold blooded animals their exchange of material and growth will be stimulated by warmth depressed by cold. Strong infants who respond to moderate cold by vigorous movement and lusty screaming do not require a high external temperature maintained at a constant level, a steady growth will be encouraged by exposure to variations of temperature, for the regulation of the heat of the body depends upon the activity of the muscles in response to sensations of cold. In children's ward there is too often a failure to recognise that nutrition depends upon muscular activity which in turn is stimulated by cold. A child covered up in bed is exposed to the warm air (about 25° C or 77° F) under the bed clothes and although it requires more sleep than the adult it also needs in relation to its size far more opportunities for muscular activity. Ward discipline and convenience will not alter this fact. The inclination of a sick child to get out of bed and play is one of the best signs of improvement.

In warm weather the loss of heat is diminished therefore less fuel for combustion but more liquid for evaporation is needed. If muscular activity and its beneficial effect upon nutrition and growth are to be maintained the child must

be lightly clad. The chemical changes in a child's body are relatively greater both in quality and quantity than those of an adult and for this reason it is easier for the child to compensate for cold than for heat. Guided by instinct, the child will adapt itself but trammelled by the ignorance of its elders, who have abandoned instinct for the conventions of modern civilisation it is placed at a serious disadvantage during a heat wave. Especially at night time during warm weather the child should be allowed to lie exposed if it is so inclined, for healthy sleep is accompanied by a fall in temperature.

Other Examples of Clinical Significance

Another example of failure to recognise at first the relationship between muscular activity and the temperature of the body was seen in the modern treatment of consumptives by an open-air life and progressive muscular work. In some sanatoriums it was the custom to order rest in bed for patients whose temperature showed a rise after exercise, because it was believed that the healthy man maintained a constant temperature. Muscular work raises the temperature of healthy men and animals and the rise to the optimum is an advantage, for it favours the exchange of material upon which efficient work depends.

In practice the application of the modern theory that heat stroke is due to a hypothetical micro-organism is dangerous, it neglects the relation between muscular work and the regulation of temperature, which affords an adequate explanation of the disorder and of the success of the cold-water treatment.

In anaesthesia the paralysis of sensation and voluntary movement is associated with the suspension of the capacity to regulate the temperature, the deeper the anaesthesia the greater the loss of control over the production and loss of heat. Numerous observations show that the internal temperature of the body falls during anaesthesia unless artificial warmth be applied. The typical response to changes of external temperature is no longer seen, the metabolism and heat of the body rise and fall with the external temperature. The patient loses heat by the skin and the respiratory tract, it is possible to diminish or prevent the cutaneous loss by warm clothing and a heated operation table and the pulmonary loss by making the patient breathe air and anaesthetic vapour already warmed and moistened. It is not necessary to have the temperature of the operation theatre raised to a tropical heat which diminishes the efficiency of the staff and introduces the danger of the sweat of the operators undoing their elaborate precautions against sepsis.

Morphia blunts other sensations as well as those of pain and by reducing the excitability of the central nervous system diminishes the capacity to regulate the temperature. There is evidence to show that in some cases at least the collapse observed in wounded soldiers who have been exposed to cold may be due to the large doses of morphia administered to them when they received first-aid. As regards the action of alcohol attention has been drawn already to the diminished capacity of drunkards to resist cold or heat and the recognition of alcohol as an important factor in the incidence of heat-stroke.

The disturbances produced in the temperature of patients by lesions of the central nervous system have attracted much attention, but the cases have been regarded as very obscure owing to the fact that lesions apparently similar may be accompanied in one case by no obvious change in temperature in another by a fall of temperature hypothermia in another by a rise of temperature hyperthermia, or in another by a sequence of all three conditions. Regarded from the point of view of the theory of specific heat centres these cases are obscure but considered in relation to the development of the power of regulation of temperature such variations would be expected. A complete transverse section in the lower cervical region of the spinal cord divides the living body into two parts the upper, under control of the chief sensory and motor mechanisms is warm blooded, the lower paralysed and relegated to its more primitive level resembles in its response to heat and cold a cold blooded animal. The effect observed is the resultant of the opposite tendencies of the two portions of the body. Treatment must be based upon a recognition of this condition.

An adequate consideration of evidence in support of the foregoing remarks is impossible in the limits of an abstract but will be supplied when the lectures are published.

An Address

THE TUBERCULOUS SOLDIER

Delivered at the Annual Meeting of the National Association for Prevention of Tuberculosis, held on July 26th,

By SIR WILLIAM OSLER, BART, M.D., F.R.S.,
REGIUS PROFESSOR OF MEDICINE AT THE UNIVERSITY OF OXFORD

GENTLEMEN,—No matter how well organised an army from the sanitary standpoint, we have to face the fact that the soldier takes with him to the field two great enemies, the tubercle bacillus and the pneumococcus. In proportion as the incidence of the war pestilences, typhoid, typhus, dysentery, cholera, and malaria falls the importance of these civil germs rises. In a group of above 50,000 picked workmen at Panama for centuries the 'white man's grave,' with the progressive control of yellow fever, dysentery, and malaria, and a fall in the general death rate to a point lower than in any American city, up went the curves of pneumonia and of tuberculosis, until, as in temperate regions, these diseases headed the list. The Allied armies in the West have been singularly free from camp diseases—no cholera, typhus, or malaria, and extraordinarily little enteric. Never before in history has so great a host been assembled, never before in any war have armies been so healthy. The common civilian diseases have had their innings, and have played relatively the more important rôle—colds and coughs, rheumatism in many forms, and mild fevers. When the mortality statistics of diseases are published from the army of the West the "best killer" will be found to have been the pneumococcus, a home bred germ, which the soldier takes with him or easily procures from a comrade. A short sharp honest disease, pneumonia either kills at short range or recovery is rapid and without sequelæ.

THE PROBLEM BEFORE THE NATION

Our business to day is with a very different germ, the longest range variety of all—the tubercle bacillus—and its martial relationship. Three preliminary statements are necessary. 1 In a majority of the cases the germ enlists with the soldier. A few, very few, catch the disease in infected billets or barracks. What percentage of men between the ages of 18 and 40 harbour the tubercle bacillus we do not know, but we do know that it is exceptional not to find a few in the bodies of men between these ages dead of other diseases. 2 Of one million enlisted men between the ages aforesaid the proportion to develop tuberculosis is probably much smaller than if these men had remained in civil life. It will be possible later to work out the exact incidence for comparison with the figures already available, but the circumstances of the soldier life as a rule do not weaken, but strengthen, the body's resistance. Everyone must have been impressed with the beneficial change wrought by a year in the army upon the physique of the average, town lad. 3 Exposure, hardships in the field, injury, drink, and syphilis may bring about conditions in the body favouring the development of bacilli already existing or which may gain access to it, and the soldier reports sick with tuberculosis of lungs, glands, pleura, bones, or brain.

The problem before the nation is what to do with the tuberculous among about one tenth of the population who have undertaken its defence. Even were a loyal gratitude to these brave fellows not involved, the obligation is plain to care for them in the best possible way—the doubtful cases to study, the early cases to cure, the incurable to succour to the end. Society, itself directly responsible for the prevalence of the disease, owes this duty to the tuberculous whether soldiers or civilians. I do not think we are to look for a great increase in the number of cases in that portion of the community which has undertaken military service. We are not going to double our tuberculous population, and are not to expect 70,000 deaths instead of 50,000 annually. The question is simply one of extension and perfecting of existing organisations, extension for which the profession has been clamouring for ten or more years and the bettering of an organisation which unfortunately has radical

defects. Democracy "comes high" when parochialism is its final outcome. Successful war can never be waged without a strong general staff with absolute subordination of the units. Warfare against the Germans in two years has cost very many lives, but the tubercle bacillus in one year costs this country 50,000 lives. In either case a strong central controlling machine is the first element of success. We may hope so to perfect our war machine as to conquer the Germans within the three years, but where is the general staff which is to wage the next 30 years' war against consumption? Lethe-loving Molluscs we missed the golden opportunity of the Royal Commission a few years ago to establish national control of the nation's greatest domestic war, and instead, of a Napoleonic campaign we have the guerilla warfare of the borough, county, and district council, with counsels of perfection in place of commands from the Local Government Board.

NUMBER AND CLASSIFICATION OF CASES.

But let us review the conditions—the number of tuberculous soldiers, the classification of the cases, the existing machinery and its possibilities.

Number of cases—In 1915, 2770 cases of tuberculosis were dealt with by the Chelsea Board. In reply to Mr Astor in the House of Commons on Feb 22nd, Mr Tennant stated that of these 1641 were awarded pensions and 1129 claims were not allowed. We cannot say what proportion this total number bears to the enlisted force, but in any case it is small in comparison with the general incidence of the disease in the community. I have tried to get the exact figures from several hospitals. At the American Women's War Hospital, Paignton, among the first 3000 cases admitted there were only three cases of pulmonary tuberculosis (Dr Penhallow). At the Canadian Hospital, Taplow, among 6233 admissions there were 26 proved, and 16 doubtful cases (Captain Neff). This hospital serves a large section takes all classes, and at one time admitted many territorials from local training camps. The Paignton figures represent men admitted from France and the Mediterranean. 1 per 1000 is I am afraid, too low an estimate. The Taplow figures are likely to be nearer the truth.

Classification—In the first place, let us demand a careful sifting of the cases. The label does not always mean tuberculosis. Bone, joint, gland, and meninges offer no difficulties but tuberculosis of the lungs and pleura is beset with diagnostic pitfalls. Make a primary separation into the two great groups of the open and closed pulmonary forms. With bacilli in the sputum the case is definite and in all stages we know what to do. The closed case is a suspect, to be studied in a sceptical attitude; and not to be labelled tuberculous without the most critical scrutiny. A large majority of us in this room are closed cases of pulmonary tuberculosis—that is to say we have small foci of infection in lung or bronchial gland. Some day over the parapets rush the long entrenched enemy and a local flare-up in lung, with cough and fever or an acute pleurisy, are outward and visible signs of the attack. Let us ask have the closed cases considered apart, labelled as such and carefully followed. This is not the occasion to deal more fully with this class. One half of the cases I have seen are not tuberculosis. The claims of doubtful forms must be determined by experts. So far the relation to service is concerned there are three groups. 1 The old *poitrineux* who has slipped past the recruiting officer and the medical examiner. A pathetic and comely element blend in the story of these cases. I saw the history sheet the other day of a man who had been for four years in attendance at a tuberculosis dispensary with bilateral disease but he slipped in, stood his training, and was actually sent to France. On his way to a sanatorium from Cheltenham a man with fever and bacilli in the sputum changed his mind and enlisted at Worcester. The comely one has a never failing optimism and considers himself much better than he really is. I have notes by Dr Stobbs our tuberculosis officer, of 12 men in attendance at an Oxfordshire dispensary, all with bacilli who have been passed for the army. I pass round his notes. 2 Health men with a past history of pleurisy or of pulmonary tuberculosis and in whom the vicissitudes of the soldier's life have stirred up the old trouble. Hæmoptysis after a route march pleurisy with effusion acute broncho-pneumonia with

return of the bacilli indicate the recurrence. III The healthy recruit who has either been infected in the army or has had a latent focus, one cannot say which. We should make no difference in the treatment of these cases. Even when mistakes have been made the country is responsible, and they are citizens as well as soldiers. In an inquiry made by Dr McConnel in 13 sanatoriums out of 160 cases 90 were regarded as due to the war, in five other places 'most or very many of the 84 cases were attributed to this cause'.

THE EXISTING MACHINERY

Let us take the existing machinery in three stages of his career. The tuberculous soldier comes under the Army rule that when a man is unfit for military service he is discharged. As the decision of the Army Board is of the 'Medes and Persians' type, it is all-important that it should be made only after the most careful consideration of each individual case. Discharged tuberculous the civilians to whose care he is entrusted must take him as such with no shadow of doubt—is it not written on his discharge paper? And it is assumed that he will never again be fit for military service. Altogether it is a very black ball against a man's physique. This stage has been dealt with in your Council's last report. Last year, at the instance of Dr Theodore Acland Dr Perkins arranged a meeting of the Council with Sir Robert Morant, Dr Newsholme, and Army representatives at which the matter was fully discussed. The Council, I may say, was of opinion that much good would follow if the tuberculous soldier could be allowed sanatorium treatment before his discharge but this does not seem possible to arrange. So far stage No 1. Stage No 2 is more fully dealt with in the following paragraphs of the report—

Sir Robert Morant kindly attended a meeting of the Council of the Association and explained the machinery for dealing with the problem and the steps which his department took. The Insurance Commissioners received notice from the War Office of all tuberculous soldiers who were about to be discharged from the Army. They then notified the Local Insurance Committee to whom the man's case naturally belonged and by whom suitable provision was made the Commissioners paying £20 per case to ensure priority of treatment and so avoid delay before admission. So far the cases dealt with had amounted to 1400, and Sir Robert assured the Council that in no single case had his department failed to find accommodation. There had of course, been individual instances in which men neglected to take advantage of the provision offered.

Provision of treatment for the individual does not, however, end the matter. An adequate pension must be granted. This is the more necessary because, if he is discharged from the Army as has hitherto been the rule, the separation allowance on which his wife and children depend, ceases. Anxiety for their welfare seriously interferes with the results of treatment, and as a matter of fact, the best class of man is apt to sacrifice his own future to return home and work for his family: thus all prospect of lasting recovery vanishes. In lieu of becoming a self-supporting citizen for the future he tends to degenerate into a chronic invalid to become a burden on the community, and spread the disease.

We all recognise how anxious Sir Robert Morant and his colleagues are to provide institutional treatment for tuberculous subjects. To inquiries made in many places I have had as a rule satisfactory answers. At Newcastle for example, I was assured recently that there had been no trouble and that they had empty beds. On the other hand I have heard complaints of delays in getting into monetary touch with a Local Insurance Committee and in many places the sanatorium accommodation is wholly inadequate. In Wales, where I have had the pleasure recently of inspecting many of the dispensaries and sanatoria, I was told that the supply of beds for soldiers was sufficient and I visited at Newport an excellently arranged special hospital for soldiers. There is no reason why this stage No 2 of his progress should not be easily and satisfactorily arranged. The machinery is there but it is no always possible to get the soldier to use it, too often he prefers to go home. Dr Neil of Taplow Hospital tells me that not 1 in 10 of the English tuberculous soldiers will accept treatment! It is to be hoped that a large proportion of the men who receive treatment will be so improved as to be able to do light work with a pension as the nucleus of their support: seek benefit and sanatorium benefit having come to an end! The soldier then returns to his village and is taken charge of by the local committee of the National

Society for Looking After the Disabled Soldiers and Sailors. He is found suitable work, or trained in some remunerative occupation, and he finally graduates into the class of self-supporting citizens. One important question—of the 2770 cases in 1915 only 1641 were rewarded pensions, the claims of the others were not accepted. Why?

Stage No 3, which one half of the cases will reach, offers serious difficulties. Tuberculosis is essentially a 'chronic disease. As Garth says "Her strokes are sure, but her advances slow." The soldier becomes a 'chronic consumptive, unable to work, perhaps without a pension, or with one insufficient to support his family, even with the permanent disablement allowance. This is the man we must look after, but his case is beset with problems. In the first place, his ship is adrift, neither Army nor Government at the helm. The public must undertake to keep him off the rocks. Officially we are helpless, as our rate charity, which should partake of the nature of a common chest at the disposal of a stranded brother, is too tainted for a self-respecting man to touch. At present these men are literally at sea, and in most places without proper guidance or care. Many are able to do light work in the intervals of attacks of fever. Past the sanatorium stage there is often no place for such patients to go as the general hospital does not like the open tuberculous. Suitable hospitals for advanced cases are not common, and unless very attractive, home, even a wretched home, is preferred. Many such cases are living in surroundings impossible to keep aseptic, and the danger of infection is very great. I have gone over with one of our tuberculous nurses the list of 15 discharged soldiers in Oxfordshire. I will not worry you with details, many of which are most distressing but they show that the need of organised help for the men who have reached Stage 3 is urgent.

SUGGESTIONS

Reviewing the whole subject the following suggestions appear to be in order.

1 A more searching examination should be made of recruits. Doubtful cases should be referred to the tuberculous expert of the district. Men unfit to be worked up to the soldier standard become simply material for pension claims.

2 Army experts should decide upon the doubtful cases before discharge. Provision should be made for their study. There are plenty of tuberculous specialists in khaki whose knowledge should be used to put these borderland cases into their proper categories.

3 A national organisation should look after the welfare of the tuberculous soldier with subsidiary branches in each county. A roll and a record should be kept and every case supervised with the greatest care. 'As the man who suggests a new society in these days deserves to be shot' I would urge that this National Association undertake the work, in cooperation with the Society for the After-care of Soldiers. A small central committee of these two bodies, with representatives of the Local Government Board and of the Insurance Commissioners, could organise after-care committees in each county and bring official pressure to bear upon authorities to furnish the proper hospital accommodation.

A public duty which is at the same time a privilege is not likely to be neglected, and the people of this country may be relied upon to care to the end for men stricken by disease while fighting their battles.

THE King has given to Dr L C P Phillips, professor at the Government School of Medicine, Cairo, and physician to His Highness the Sultan of Egypt, His Majesty's Royal licence and authority to wear the insignia of the Third Class of the Order of the Nile which has been conferred upon him in recognition of valuable services rendered.

PATRIOTIC SHOPPING—The medical profession, in common with other professional organisations, has taken means to protect the interests of its members who are on active service, and will view with sympathy the appeal issued by three Secretaries of State to extend the same consideration to those whose shops and businesses are likely to suffer from their absence. The circular which is addressed to mayors and the chairmen of local authorities, deprecates the transfer during the war of customers' patronage to other than their usual tradespeople.

SERUM REACTIONS OF 300 UNSELECTED CASES OF "ENTERIC"* WITH THE OXFORD STANDARD AGGLUTINABLE CULTURES

By ERNEST GLYNN, M A, M D CANTAB, F R O P LOND,
CAPTAIN R A M C T PATHOLOGIST FIRST WESTERN GENERAL
HOSPITAL PROFESSOR OF PATHOLOGY UNIVERSITY
OF LIVERPOOL

AND

E ORONIN LOWE, M B, B S LOND,
PATHOLOGIST ST JOHN'S HOSPITAL, SOUTHPORT
(From the Thompson Yates Laboratory)

DURING the last few months a large number of "convalescents" from the Eastern Mediterranean have entered the Auxiliary Hospitals of the First Western Command with a diagnosis of typhoid or "enteric," and some with a diagnosis of paratyphoid. As nearly all have been recently inoculated against typhoid though not against paratyphoid, it seemed to us highly probable that many of the cases were wrongly diagnosed as typhoid, especially as a large number had certainly suffered from dysentery. Because practically all were "convalescent," and nothing could be learned by blood cultures, and very little by examining the excreta we attempted to arrive at a bacteriological, and therefore correct, diagnosis, by testing the agglutination reactions with the Oxford Standard Agglutinable Cultures of typhoid and paratyphoid A and B.

The work was commenced in the second week of November. Three hundred unselected cases were examined, drawn as far as possible consecutively, from St John's Hospital at Southport, the Liverpool Royal Infirmary, the Liverpool Tropical School Auxiliary Military Hospital, and the Mill Road Auxiliary Military Hospital. Most of the work was done in the Pathological Laboratory of the University of Liverpool, the rest in Southport.

Agglutination Technique

The technique was carried out exactly as recommended in the "Directions" issued from the Department of Pathology,¹⁷ Oxford University, on behalf of the Medical Research Committee. In order to save time many pipettes were used, and the drying of the pipettes and agglutination tubes after washing was hastened by placing them in a hot oven. The agglutination tubes were incubated in a water bath at 55°C, and kept at that temperature by placing the bath in a paraffin oven supplied by Messrs Baird and Tatlock, the oven accommodated eight racks of tubes. After two hours' incubation the tubes stood for from 10 to 15 minutes at room temperature, and then the readings were taken. This was done in a cupboard with a black background containing an electric lamp, the cupboard prevented daylight of varying intensity diffusing into the electric light, and so causing the readings taken during the day or night to differ. Some such apparatus as this is essential for accurate work, especially if the readings are taken by different observers.

The readings were all taken by one or other of us but the technique in fully a third of the cases was carried out by a laboratory assistant who was quickly taught. Every serum was tested to typhoid, paratyphoid A, and paratyphoid B, the dilutions being 1-25, 50, 125, 250, also, if necessary, 1-500, 1000, 2500, 5000. Frequently there was an agglutination with sedimentation in a tube e.g., 250, and no agglutination whatever in the next e.g., 500. In such cases the agglutination titre is indicated in our paper by 250+.

Agglutinin units.—In order to ascertain the number of "standard agglutinin units" it is necessary to divide the titre by a figure given on the bottle. During our work this denominator for paratyphoid A varied from 2.7 to 4.1 and for paratyphoid B 2.7 to 3.5 a change which had no appreciable effect on our results. The figure for typhoid however, gradually rose from 4.7 to 7.7. In certain cases this change raised the agglutination titre—e.g., Case 9, paratyphoid A series first examined seven weeks after convalescence, titre 125 (denominator 5.6), three subsequent examinations,

titre 250 (denominator 7.7). If such an alteration in the emulsion has undoubtedly caused an apparent rise in titre we have assumed, when interpreting our results, that there has been no change in titre. We have found the Oxford emulsions most satisfactory. On rare occasions they become cloudy after frequent use, probably from bacterial contamination.

Collection of blood.—Our greatest practical difficulty was to obtain sufficient blood to yield the necessary six complete drops of serum. We found it necessary to direct special attention to the following points: (a) Wright's capsules. Those supplied by many firms are too small and not properly shaped. The lumen of the tube should be at least $\frac{1}{2}$ inch in diameter, the length excluding the tapering ends $1\frac{1}{2}$ inches. The curved end should be of wide diameter and short, otherwise the large drops of blood will not flow quickly into the tube, and fall on the floor. (b) Collecting the blood. The patient was instructed to hang his arm down or, better, to swing it round several times. If necessary he soaked the hand in hot water to cause vascular dilatation. A rubber catheter, not a piece of tape, was bound round the finger as far as the terminal phalanx, and the back of the finger pricked near the nail with a large triangular surgical needle, size No 1. An ordinary needle does not make a large enough hole. If enough blood was not obtained the rubber was removed and after the finger had been massaged it was reapplied. 0.75 of a c.c. of blood is sufficient. The blood was collected by the ward sisters, who became experts after a little tuition.

Accuracy of Technique

Hort¹⁸ stated, although employing Dreyer's emulsions "We do not find the drop method of sufficient accuracy for routine work on a large scale." After making over 3000 examinations we disagree with this statement, for example. Sixty-six consecutive convalescent cases of "enteric" had their agglutinins estimated on four occasions at intervals of about a week, about 80 per cent of the tests were done by one observer. In 34 convalescents all four tests gave the same titre, including 5 convalescents in whom the titre rose one tube due to a change in the emulsion denominator from 5.6 to 7.7. In 15 convalescents three tests gave the same titre, the variation in the remaining test was a rise or fall of one tube only, in 10 cases this variation was probably due to technical error, and in 5 cases to alteration in agglutinin titre. In 15 convalescents two tests gave the same titre, 10 showed a variation in one tube only 5 of which were probably due to error, and the other 5 showed a variation of two tubes only none of which were probably due to error. In 2 convalescents every test gave a different titre the extreme variation being three tubes, none of which were probably due to error.

In our experience an alteration in titre in one tube only in successive tests with the same emulsion probably indicates an alteration in the amount of agglutinins, though it possibly indicates an error, whereas an alteration of two tubes certainly indicates an alteration of agglutinins, so long as gross carelessness can be excluded. It is quite true that greater accuracy would be attained by using "considerable volumes" of serum, as Hort suggests, instead of drops. This, however, is not practicable in most laboratories in war time, as it would require so much blood and more apparatus. It is quite true, also, that greater accuracy would be attained if the intervals between the tubes were less than 25, 50, 125 &c, for then the exact "end point" would always be reached, but this would again demand more time and apparatus.

Some of our errors were probably due to using slightly hemolysed blood, for with it the "end point" is more difficult to read, to not always obtaining six full sized drops of serum, owing to insufficient blood being taken, and, perhaps, to keeping the blood on certain occasions three or four days before testing. It is probably advisable to hold the dropping pipette at the same angle when distributing the drops, and to use a separate pipette for each sample throughout the dilution technique.

In our opinion the macroscopic method as perfected by Dreyer and his collaborators is eminently suitable for routine work on a large scale in war time, particularly for bacteriologists without any previous training. The technique itself can easily be mastered by an intelligent orderly after a short time. The method also has this great advantage: it is a successful and scientific attempt to standardise "enteric"

* Enteric Fever:—(a) Typhoid Fever (b) Paratyphoid Fever. See 1916 edition Nomenclature and Classification of Diseases Royal College of Physicians (at present in the press) THE LANCET 1916 vol 1 p 837

glutination tests and therefore to make the results obtained different laboratories strictly comparable

It is impossible satisfactorily to compare results obtained using different macroscopic or microscopic techniques and emulsions of different densities of sometimes dead and sometimes living organisms derived from different strains, of doubtful parentage, of different inherent agglutination capacity, cultivated on different media for different periods of time, perhaps at different temperatures, and, last but not least, of using different standards for positive or negative results

The average Briton unfortunately is a "conscientious objector" to employing standard methods and apparatus and interferes with the "freedom of the individual." The Federal Research Committee has if we may be allowed to say so, acted most wisely not only in advertising this particular "standard method" but also in supplying the apparatus and emulsions free to all R.A.M.C. officers, and if it was generally adopted the ultimate gain would far outweigh any temporary loss, due to change of technique

Controls—We have tested the diagnostic value of standard emulsions by various controls and found that the serum of those vaccinated against typhoid or convalescent from typhoid produces no co-agglutinin for paratyphoid A or paratyphoid B 1-25. On the other hand, typical paratyphoid A bacilli have been isolated from the excreta of 4 convalescents, typical paratyphoid B bacilli from 8 and typhoid from 2, by other workers in the laboratory—namely, Dr Vera Foley, Dr Mary Price and Dr A. L. Robinson, the sera of all 14 convalescents agglutinated the corresponding emulsions in titres ranging from 1-25 to 1-500

Results

Clinical—Seventy eight per cent were admitted with a diagnosis of typhoid or "enteric," and 22 per cent of paratyphoid or stated that paratyphoid was a second diagnosis, 4 stated they had paratyphoid A and B. Ninety three, i.e. 31 per cent, said that the first diagnosis was dysentery while 112, i.e. 37 per cent, gave a history of severe diarrhoea with a passage of blood and slime, often with straining. Eighty five per cent. had apparently contracted "enteric" on the G— Peninsula and the remainder in E—, M—, or elsewhere. Every patient was also asked whether blood was taken from the arm, i.e. for blood culture, from the finger or ear on a slide, i.e. for malaria, or in a tube, i.e. for agglutination test. The date of reporting sick, which was usually remembered to the very day and the duration of the illness until they were allowed to get up for the first time, was also ascertained in each case. Thus we were able to obtain a rough idea of the date of the beginning of convalescence.

Of 260 men who were questioned 254 stated they had been inoculated against typhoid, 1 refused inoculation, 1 had not been inoculated, 4 were not sure, 40 men, all examined in November, were not questioned. Six stated that they had been inoculated against paratyphoid in 1915, 4 of them were inoculated in August or later, 3 at M— and 1 at A—, the details for the others were not ascertained. Three of these cases agglutinated typhoid and paratyphoid A only 1 typhoid only while 2 agglutinated neither typhoid nor paratyphoid A or B in 1-25

We do not attach undue importance to the statements made by the soldiers but must say that on the whole, their answers were very intelligent and quite definite, much more so than those of the average hospital patients. Practically everyone knew his maximum temperature, and knew whether he passed blood or slime. One or two were not quite certain whether their blood was examined as they had been delirious. Hardly any knew whether their excreta had been examined and if so with what results.

Serological—Prophylactic typhoid vaccination almost always produces more or less typhoid agglutinins which usually persist for months or even years. Consequently, as Dreyer and his co-workers point out (1) a serological diagnosis of active typhoid in the inoculated cannot be made without two or more successive examinations separated by "intervals of a few days to see if any variation in the typhoid titre occurs," and (2) a serological diagnosis of active paratyphoid can be made in persons who have not been inoculated against paratyphoid by one examination only for "agglutination in a dilution of 1-25 in titres a strong suspicion of paratyphoid infection

(1) The men rarely knew on what date their temperature became normal

marked agglutination in a dilution of 1-50 or more is (nearly always) diagnostic of active paratyphoid infection" (1)

In almost all of our 300 cases the febrile period was passed and convalescence well established, consequently the first of these principles will not apply. Dreyer, however, also states that in typhoid convalescents who had not been inoculated against typhoid, the typhoid agglutination titre "will always show a definite and measurable diminution of titre in the course of a week or two." One would naturally therefore expect that in typhoid convalescents who had been inoculated against typhoid the typhoid agglutination titre would also show a diminution in the course of a week or two, though the titre would not fall below the "higher base line" which is found in the inoculated. One would also expect that the paratyphoid titre in paratyphoid convalescents would show a measurable diminution in a week or two. Unfortunately, owing to war conditions, it has been impossible for us to test the agglutination titre of every convalescent on two or more occasions and at the same intervals, nevertheless 216 were tested more than once, usually three or four times.

Tidy has stated recently that "there is evidence that marked pyrexia, perhaps 102° F for five days, is associated with diminution or complete disappearance of" typhoid inoculation agglutinins. "These agglutinins may return, but usually do not" (italics ours). He infers, therefore, that "a positive agglutination reaction to B typhosus after the fifth day of pyrexia has the same value in an inoculated as in an uninoculated person." Tidy has published very little evidence in support of his rather revolutionary statements, besides, he employed a microscopic method, which is less accurate than the best macroscopic method. Dreyer, Gibson, and Walker have just published figures which completely dispose of his main contention.

We ourselves estimated the typhoid agglutinins of 15 inoculated soldiers taken consecutively, who had suffered from pyrexia of at least 102° F and for at least five days, due to lobar pneumonia, acute pleurisy, rheumatic fever, and surgical complaints, in 3 the pyrexia was still present at the time the blood was taken. All agglutinated typhoid in titres varying from 1-50 to 1-500.

It is possible, though not proved, that the general lowering of "resistance" which occurs in diseases associated with prolonged pyrexia may sometimes temporarily diminish the titre of "inoculation" agglutinins. To act however, on the assumption that a positive typhoid agglutination reaction has "the same value" in the inoculated as in the uninoculated might be disastrous for the Army, with all respect to Captain Tidy. Clearly, if the serological tests were believed, the "vast majority of febrile affections occurring in those recently inoculated against typhoid would necessarily be diagnosed as typhoid." In our opinion cases of dysentery with pyrexia from the Eastern Mediterranean were wrongly diagnosed as typhoid last summer, because it was not sufficiently realised how high the titre of typhoid "inoculation" agglutinins might be.

GROUP I—Cases Agglutinating Paratyphoid A or Paratyphoid B

Paratyphoid A series—Thirty six cases agglutinated in titres ranging from 1-25 to 1-250, and typhoid from 1-25 to 1-250. They were first examined on the average seven weeks after the onset of convalescence, 31 were examined on at least one subsequent occasion, the average time between the first and last examinations was four and a half weeks.

Paratyphoid B series—Seventy four cases agglutinated in titres ranging from 1-25 to 1-2500 and typhoid from 1-25 to 1-2500. They were first examined on the average seven weeks after the onset of convalescence, 52 were examined on at least one subsequent occasion, the average time between the first and last examinations was five weeks.

Comments—Almost all, if not all the cases in this group are examples of recent paratyphoid infection for the following reasons:

1 (a) Out of 87 who were questioned, 86 stated that they were inoculated against typhoid. (b) Only 3 stated that they were inoculated against paratyphoid—1 in August, 1915 and 2 in December 1915. Probably they were mis-taken first because paratyphoid vaccine has only been used systematically this year and secondly, because none of the

Complete tables of these cases and some other additional matter will shortly be published in the Journal of the Royal Army Medical Corps.

three agglutinated paratyphoid B, which they probably would have done after a mixed vaccine of paratyphoid A and B, especially as the agglutination titre reached by paratyphoid B is on the average much higher than that for paratyphoid A when tested with the Oxford emulsions. After testing the serum reactions of about 600 cases of dysentery and "enteric," we have so far found only three sera agglutinating both paratyphoid A and B, two had been inoculated with paratyphoid vaccine and the third apparently had not (c) Possibly, of course, one or two of the cases may have had paratyphoid fever before the war, and the paratyphoid agglutinins have persisted and so misled us. There was, however, no clinical evidence of these attacks, and the error from this cause must be negligible.

2 If the typhoid agglutinins were due to typhoid inoculations several months ago, and the paratyphoid agglutinins to a paratyphoid infection a few weeks ago, one would expect the titre of the latter to diminish, as a rule, in the four weeks which elapsed between the two examinations, whereas the titre of the former would show little or no diminution, provided that the typhoid agglutinins were uninfluenced by paratyphoid coagglutinins. That this is actually the case is shown in a remarkable manner in Table I.

TABLE I—Cases Agglutinating Paratyphoid and Typhoid, showing the Percentage in which the Titres of Paratyphoid and Typhoid remained Stationary, Rose, or Fell between the First and Last Examinations

Paratyphoid A first examined average 7.1 weeks after convalescence, last examined 11.5 weeks. Paratyphoid B first examined average 6.3 weeks after convalescence, last examined 11.2 weeks.

	Paratyphoid					Typhoid			
	No of cases	Stationary /	Rise /	Fall /		No of cases	Stationary /	Rise /	Fall /
P T A	31	19.4	3.2	77.4	23	82.1	3.7	14.2	
P T B	52	11.5	4.0	84.5	50	76.0	6.0	18.0	
P T A and B	83	14.5	3.6	81.9	78*	78.2	5.2	16.6	

* This figure is reduced from 83 to 78, because 4 cases did not agglutinate typhoid 1-25, and 1 was tested only once for typhoid.

(a) The difference in the behaviour between the typhoid and paratyphoid agglutinins is even greater than shown in the table, because the typhoid titre fell markedly—i.e., more than 1 tube in only 1.4 per cent, whereas the paratyphoid titre fell markedly in 48 per cent during approximately the same interval.

(b) Though the paratyphoid titre has fallen in the majority of cases and usually to a marked degree, there are a few, as one would expect, in which it remained either stationary or fell at first only. In this connexion it is interesting to note that those which remained stationary were first examined 8.2 weeks after convalescence average interval 5.7 weeks, those which fell one tube 7.4 weeks, average interval 4 weeks, those which fell two or more tubes 5.5 weeks after convalescence, average interval 5.4 weeks.

It is remarkable that the titre of the paratyphoid "infection" agglutinins when first tested was usually less than that of the typhoid "inoculations" agglutinins and also usually diminished rapidly and often disappeared, while that of the typhoid agglutinins showed no change. Thus 13 out of the 31 paratyphoid A cases first examined 7.6 weeks after convalescence failed to agglutinate paratyphoid A 1-25 when examined again on the average 4 weeks later, and 23 out of 52 paratyphoid B cases examined 5.3 weeks after convalescence failed to agglutinate paratyphoid B 1-25, on the average 4.7 weeks later. In other words, had the examination been delayed on the average from about 6 to 10 weeks two fifths of the paratyphoid cases would not have been diagnosed by the technique we employed.

One would naturally have expected that the paratyphoid agglutinins produced by a recent natural infection of some weeks' duration with presumably large numbers of living bacilli, would have outlasted the typhoid agglutinins produced several months ago by comparatively small doses of dead typhoid bacilli administered on two occasions only. The fact that typhoid vaccines are made from strains of bacilli selected partly on account of the capacity to form a large amount of inoculation agglutinins may help to explain this phenomenon.

Our results, however, confirm the statement of the Medical Research Committee's leaflet that the titre of paratyphoid "infection" agglutinins eventually falls "below the persistent base line of typhoid agglutination of inoculated persons." Peruzzi,¹² who recently examined the blood of a number of officers 30 months after they had either suffered from typhoid or had been inoculated against that disease, found that the infection agglutinins were absent in 63 per cent, while the inoculation agglutinins were present in 75 per cent.

(c) The rise in titre in about 5 per cent of paratyphoid and typhoid cases was probably due to experimental error except in two cases paratyphoid B series 11 (intermittent carrier) and 38, which rose from 1-50 to 1-250.

3 Co-agglutination is in all probability not responsible for any of the paratyphoid titres in Group I, still, its possible occurrence must be considered from three standpoints—

(a) Paratyphoid A producing co-agglutinins for paratyphoid B and vice versa.—There was no evidence of this, in fact, we have only found three cases agglutinating both paratyphoid A and B, and in two of them the agglutination was probably due to a dose of mixed vaccine.

(b) Typhoid producing co-agglutinins for paratyphoid A or B.—There was no evidence of this, in fact, the sera of 25 convalescent enterics with a typhoid titre ranging from 1-250 to 1-5000 all failed to agglutinate paratyphoid A or B 1-25.

(c) Paratyphoid A or paratyphoid B producing co-agglutinins for typhoid.—Our figures demonstrated that a recent paratyphoid B infection certainly raised the titre of typhoid inoculation agglutinins, thus the typhoid titre was 250 or more in 51 per cent of the P T B series, whereas the same titre was reached in only 1.4 per cent of the P T A series, and 20 per cent of 162 cases which agglutinated neither paratyphoid A nor paratyphoid B (see Group III). Dreyer¹³ also found that active paratyphoid infection might produce a rise in inoculation typhoid agglutinins, "though it was usually much less evident in paratyphoid A infections than in paratyphoid B infections."

If the paratyphoid B infection raises the titre of the typhoid inoculation agglutinins one would expect the subsequent fall in 84 per cent of the paratyphoid B titres to be accompanied by a similar fall in typhoid titres. In reality the typhoid titres in the paratyphoid A infection fell in 1.4 per cent, but those in the paratyphoid B infection fell in only 1.8 per cent between the two tests. This remarkable discrepancy can be explained by observations made by Dreyer and Walker,¹⁴ who found that "if an animal which has been immunised some weeks or a month or two before with a particular micro-organism be inoculated with a non-lethal dose of a vaccine prepared from some other micro-organism its agglutination titre for the first micro-organism exhibits a new rapid rise of greater or less extent and pursues a curve similar to the ordinary inoculation curve." In other words, under the stimulus of the paratyphoid B infection the typhoid agglutinins have in most cases repeated the sudden rise and very slow fall which they underwent after the original typhoid inoculation. This increase is "due to a reaction of a general non-specific character affecting cells and tissues which are already engaged in the formation of specific agglutinins and causing them to take on the increased activity."

4 We believe a paratyphoid titre as low as 1-25 is probably always diagnostic of paratyphoid infection in convalescents, at any rate provided that paratyphoid vaccine had not been used—first because such titre was never present in the various controls and, secondly because in many of the cases in Group I the titre of 1-25 disappeared without any corresponding change in the typhoid titre.

We found the titre of paratyphoid B agglutinins as a rule much higher than that of paratyphoid A, thus only 11 per cent of the latter cases reached a maximum of 250 but 30 per cent of the former reached from 250 to 1250 including two of 2500 though these last were tested at the very beginning of convalescence. If the results were expressed in "standard agglutinin units" the paratyphoid B titre would be still higher—e.g., one batch of emulsion gave with a titre of 250 paratyphoid A 70 units paratyphoid B 93 units. We conclude therefore, that a paratyphoid A titre of 1-25 is more significant than a paratyphoid B titre of the same amount. Dreyer, as stated before, believes a titre of even 1-10 is diagnostic of paratyphoid A.

Our figures of "infection" agglutinins confirm those of Dreyer also of Coppinger and Gibson² with "inoculation" agglutinins. These observers found independently that after inoculation with a mixed paratyphoid vaccine the paratyphoid B titre was much higher than the paratyphoid A titre. Castellani's¹ figures show that after his vaccine the titre of paratyphoid A and B is practically the same. Harvey and Gibson³ on the other hand found the titre of paratyphoid A higher and more persistent than paratyphoid B, but they inoculated rabbits. The relative position, however, of the paratyphoid A and paratyphoid B titre in a given series of cases will depend not only on the quantity of specific agglutinins and their persistence when formed, but also upon the relative agglutinability or sensitiveness of the emulsions used to measure these agglutinins.

Paratyphoid carriers.—The relation between paratyphoid carriers and paratyphoid agglutinins was shown in two cases. The first was that of a chronic paratyphoid B carrier. The paratyphoid B titre has remained steady at +1-500 for 12 weeks whereas the typhoid has fallen from +1-1250 to 500 in the same time. The second was that of an intermittent carrier who has shown remarkable variations in titre. 5 weeks after convalescence the titre was 1-125, in 17 weeks it had disappeared, but with the reappearance of paratyphoid bacilli in the excreta it again rose to 1-125 **

The Relative Frequency of Paratyphoid A and Paratyphoid B

All the statistics from the Near East whether from cultures or serum tests—the results of the two methods will not necessarily coincide—show that paratyphoid A was much more frequent than paratyphoid B (Basset Smith,¹³ Ledingham and Penfold¹⁴ Willcox¹⁵). We found the reverse 36 cases paratyphoid A and 74 paratyphoid B. The discrepancy may be partly explained by supposing that the paratyphoid B agglutinins on account of their higher original titre persist longer than those of paratyphoid A, though we have no evidence of this. There is however, a very simple explanation. Willcox, referring to Archibald's figures which give the largest number of typhoid and paratyphoid cases proved by blood cultures from the Near East says that 'up to the end of October 1915 paratyphoid B was much more frequent in occurrence than A, but after the end of October paratyphoid A was much more common.

We have arranged 107 of our cases in which the date of onset of paratyphoid could be approximately fixed and the results are given in Table II.

TABLE II

Date of onset	No. of cases	Ratio of P T A to P T B
August and September ...	55	1.0
October ...	16	1.0
November ...	15	1.2
December and January ...	15	1.5

When it is remembered that all our cases were diagnosed with exactly the same technique and under the same conditions the results confirm Willcox's statement in a striking manner. It appears that paratyphoid B infections though rare are much commoner than paratyphoid A infections in Europe especially in England whereas in India the reverse obtains.¹¹ The change in the incidence of these two diseases among the troops in the Eastern Mediterranean last October is probably due to the fact that a large number of battalions from India were brought there some of which would be infected with paratyphoid A.

Group II.—(See Figure 5.) Acute Paratyphoid B in 1-25 a the First Examination

Twenty-eight cases comprised this series. The agglutination reaction was tested on the average 7 weeks after the date of convalescence—maximum 12 and 9 weeks minimum 1 and 2 weeks. Twenty-six had been inoculated against typhoid 1 week May 1914 and December 1915 the average time from inoculation was 10 months. 1 refused

inoculation and 1 was not questioned, 2 stated that they were also inoculated against paratyphoid. Two were diagnosed as paratyphoid and 1 as "paratyphoid A and B".

Comment.—The majority of these patients probably never had typhoid, because even if the inoculation agglutinins had disappeared in about 10 months it is unlikely that the typhoid infection agglutinins would have disappeared in about 7 weeks, especially as 8 of the cases were tested 3 weeks or less after the onset of convalescence. Again blood cultures appear to have been made in only 1 case and serological tests in 8 cases. Lastly, 12 gave a history of, and were first diagnosed as, dysentery, and 1 as malaria.

GROUP III.—Cases Agglutinating Typhoid Only

It has already been pointed out that a serological diagnosis of typhoid cannot be made in those recently inoculated unless the titre of the typhoid agglutinins is estimated on two occasions at least, if not three or more separated by short intervals. Unfortunately it was only possible to do this in 133 out of the 162 cases in this group. The results are taken collectively and are summarised, in a few instances however individual cases have been alluded to. The results are arranged in three series (a) 95 cases examined on three or more occasions (b) 38 cases examined on two occasions only, and (c) 29 cases examined only once. Those of the first two series are given in Table III.

TABLE III.—Cases Agglutinating Typhoid Only showing the Percentage in which the Titre was Stationary, Rose or Fell between the First and Last Examinations

	Stationary	7 Weeks from convalescence	10 Weeks from convalescence	13 Weeks from convalescence	16 Weeks from convalescence	19 Weeks from convalescence	22 Weeks from convalescence	25 Weeks from convalescence
Series A, 95 cases	57.1	8.9	4.7	9.4	7	4.3	23.2	7
Series B, 38 cases	57.8	5.9	3.8	10.6	7.5	3.5	31.6	7.4
Series A & B, 133 cases	57.1	8.1	4.4	9.5	7	4	25.5	7.1
Typhoid in P A & P B table	73.2	6.2	4.4	5.2	7	5.2	15.6	8.1
P A & P B table	1.5	8.1	5.9	3.6	7.7	4	81.9	6.3
110 cases								4.5

Comments.—1. The titre (Series A and B) on the first examination was 500 to 2500 in 2.3 per cent, 250 in 19.6 per cent, 125 in 36.1 per cent, 50 in 27 per cent and 25 in 15 per cent. 2. In 64 per cent (Series A and B) the typhoid titre was stationary between the two examinations, which is strong evidence that the majority never had a recent typhoid infection. This is corroborated by the fact that the percentage in which the titre was stationary is only a little less than that of the typhoid titres in the paratyphoid series where we believe a recent typhoid infection had rarely if ever occurred. It forms a marked contrast to the small percentage of stationary paratyphoid titres in the same series where we believe a recent paratyphoid infection had almost always if not invariably occurred. 3. Thirty-four cases, or 25 per cent showed a fall in titre. They were arranged according to the number of weeks the first examination was made after convalescence. 46 per cent fell in the first 4 weeks after convalescence, 29 per cent in the second 4 weeks and 25 per cent from 9 to 18 weeks. In other

TABLE IV.—Typhoid Agglutinins

	Titre	Weeks	Titre	Titre	Weeks
1	250	4	125	50	9
2	250	4	125	50	11
3	250	7	125	25	13
4	250	3	125	50	12
5	50	6	25	0	15
6	50	4	25	0	7
Average		4.7			11.2

words had the first examination been made sooner a larger proportion of cases would most probably have shown a fall in titre which could be evidence of a recent typhoid infection. This fall in titre however is not really strong evidence of a recent typhoid infection, because only 7, i.e. 5.3 per cent, fell as much as 2 tubes, whereas in the paratyphoid

* In the local Research Committee's pamphlet it is stated, "A non-carrier (typhoid or paratyphoid) will normally show no agglutination in the serum on repeated examinations in a test serum. It is not that a carrier may show an important change in titre; perhaps however the word 'normal' is erroneous."

series 48 per cent fell 2 or even more tubes in approximately the same time. Six cases (Series A) showed a steady fall in the titre of at least 2 tubes, which, as they had all been inoculated against typhoid more than a year before, is, in our opinion, conclusive evidence of a recent typhoid infection.

The seventh (Series B), first examined six weeks after convalescence, showed a titre of 50, which fell to 0 in seven weeks, this also was probably a case of typhoid infection. Of the remaining 27 of both series all fell only 1 tube. As the fall was so slight, it is in the majority of cases most probably due to a gradual normal disappearance of inoculation agglutinins, or to technical error, and not to active typhoid infection.

4 Thirteen, or 10 per cent, showed a rise in titre, in 3 (Series A) the titre rose steadily viz

No 8 titre 25 (four weeks after convalescence), 125 (5), 250 (7), 50 (9), 50 (10). Inoculated against typhoid October, 1914. The emulsion denominator was 5.6 for the first test and 7.7 for all the rest.

No 9 titre 250 (9 weeks after convalescence), 500 (10), 1000 (11), 500 + (13), 500 (15). Inoculated against typhoid October, 1914. The emulsion denominator was 7.7 for all tests.

No 10 titre 50 (6 weeks after convalescence), 125 (7), 125 (8), 250 (10), 500 + (14), 500 + (16). Inoculated against typhoid May, 1915. The emulsion denominator was 5.6 for the first test and 7.7 for all the rest.

It will be noted that in Nos 8 and 9 the typhoid titres steadily rose and subsequently fell, in No 10 there was a steady rise and no subsequent fall in 16 weeks. In our opinion this change in titre, although it was unassociated with any pyrexia, is strong evidence of recent typhoid infection. It suggests the possibility that the patients are carriers, at any rate, in case 10 but no typhoid bacilli have been isolated after at least four examinations of the excreta. If these cases were typhoid, then the typhoid agglutinins in typhoid convalescents do not "always" (italics ours) show a definite diminution of titre in the course of a week or two "as one is led to infer from Dreyer's statement." Of the other 10, 3 rose 2 tubes, in 1 case (No 11) probably from infection, in 2 (and the remaining 7 rising one tube) probably from technical error or change of emulsion denominator.

5 Other remarkable evidence strongly suggests that very few in this group really had typhoid—viz, the typhoid titre reached 250 or more in only 20 per cent of the cases, whereas it reached this limit in 51 per cent of the paratyphoid B series, the rises being due to co agglutination and not typhoid infection. One would naturally expect, had typhoid infection really occurred, that the titre would have reached at least 250 in far more than 50 per cent of the cases. Dreyer⁶ found the titre greater than 1-500 in 7 out of 8 consecutive cases of active typhoid infection, even though the patients had never been inoculated.

Series C.—Of the 29 cases examined once 3 agglutinated 1-500, 6 1-250, and the remainder varying from 1-125 to 1-25.

Summary.—We have briefly summarised the results though the data are sometimes incomplete. In only 11 cases was there a strong probability if not a certainty of recent typhoid infection. Even if we assume that as many as half the remaining 27 cases in which the titre fell one tube were also infected, the total reaches 25 cases (11 + 14)—i.e., under 10 per cent of the whole 300 examined. This forms a marked contrast to the 110 or 37 per cent. of cases agglutinating paratyphoid, two or three of the latter however, may have been infected with typhoid as well. The number of typhoid infections would probably have slightly increased if the 29 cases (Series C) had been examined at least twice.

The number of typhoid infections would also have been increased if the first examination had been made earlier than at an average of seven weeks after the beginning of convalescence but so would the number of paratyphoid infections. Our proportion of 1 typhoid case to not less than about 4 or 5 paratyphoid cases is corroborated by Archibald's figures from blood cultures—19 typhoids to 122 paratyphoids and our own from the excreta of convalescents—2 typhoids to 12 paratyphoids.

Last summer the diagnosis of typhoid was often made in the Eastern Mediterranean on insufficient clinical and bacteriological evidence.

(a) Patients with continued "pyrexia of unknown origin" were called "enteric" just as they were called "influenza"

in England or "malaria" in India. The clinical diagnosis was especially difficult because fully a third were suffered from acute dysentery. There have been cases labelled "convalescent dysentery" from the Eastern Mediterranean at the Tropical School Auxiliary Military Hospital, Liverpool under the care of Professor J. W. W. Stephens and Captain A. Morgan, R.A.M.C., which have developed "pyrexia of unknown origin" lasting days or weeks, but there was no serological or bacteriological evidence of typhoid or paratyphoid infections.

(b) The bacteriological evidence was insufficient because out of 154 patients of the 162 in this group who were questioned only 8 per cent stated that blood was taken from their arm i.e. for cultures, an operation likely to be remembered. Only 40 per cent had blood taken from their finger or ear, i.e. for serum reaction, though a single examination is perfectly useless in the diagnosis of typhoid among the inoculated. A great improvement has now been made in the bacteriological diagnosis, for in a large series of "enteric" cases not included in this paper, which have recently arrived from the Eastern Mediterranean, practically all of whom contracted the disease this year, 34 per cent gave us a history of blood cultures and 45 per cent of serological tests.

Summary and Conclusions

1 The serum reactions to typhoid, paratyphoid A, and paratyphoid B of 300 consecutive recently convalescent "enterics" from the Eastern Mediterranean have been tested by Dreyer's technique and with emulsions supplied by the Oxford Standard Laboratory, through the agency of the Medical Research Committee.

2 After making about 3000 tests of these and other cases we find the emulsions most satisfactory, giving quite clear and definite readings, and the technique so simple that it can easily be mastered by an intelligent attendant. The method is accurate, the margin of error small and eminently suitable for routine work on a large scale. It is essential, however, to have the same intensity of artificial illumination by day and night for reading the titres. The only practical difficulty—viz, that of obtaining sufficient blood—was overcome by instructing the ward sisters how to fill specially made Wright's capsules.

3 Control sera of soldiers inoculated against typhoid but suffering from dysentery or surgical diseases, failed to agglutinate either paratyphoid emulsions but the serum of every convalescent, 12 in all, excreting paratyphoid A or paratyphoid B bacilli agglutinated the corresponding emulsion only in titres ranging from 25 to 250.

4 One hundred and ten, or 37 per cent. of the cases tested agglutinated paratyphoid emulsion. 36 agglutinated paratyphoid A (titre from 25 to 250) and 74 paratyphoid B (titre from 25 to 2500). They were first tested about 7 weeks after the onset of convalescence. As none, with 3 doubtful exceptions, had been inoculated against paratyphoid almost all if not all had a recent paratyphoid infection. This is confirmed by the fact that 83 cases were tested at least twice and the paratyphoid titres, presumably from "infection," fell during 4 weeks in 82 per cent, 48 per cent fell markedly, 43 per cent completely failed to agglutinate at the last test—i.e. would never have been recognised as paratyphoid had the first test been delayed from about 7 to 11 weeks after the onset of convalescence. Occasionally the fall in paratyphoid titre was rapid at first and then slower or ceased altogether. The typhoid titre presumably from "inoculation," fell in only 17 per cent of cases, only 1.4 per cent fell markedly.

5 The remarkable diminution and frequent disappearance of the paratyphoid "infection" agglutinins which usually occurred formed a marked contrast to the stationary typhoid "inoculation" agglutinins. This is partly explained by supposing that the typhoid vaccines were made from strains of bacilli specially selected on account of their capacity to form quantities of "inoculation" agglutinins.

6 Co agglutination.—(a) Between paratyphoid A and B or vice versa co agglutination did not occur with the Oxford emulsions, in convalescence at any rate, only 3 sera out of 600 have agglutinated A and B simultaneously, in 2 paratyphoid vaccine had been used. (b) Typhoid infection or vaccine produced titres from 250 to 5000 without agglutination of paratyphoid. (c) Paratyphoid B infection though not paratyphoid A infection, certainly raised the titre of typhoid inoculation agglutinins. It was remarkable, however, that the paratyphoid B titre usually fell while the typhoid

persisted, apparently the paratyphoid B infection stimulated the tissues already engaged in the formation of typhoid agglutinins to repeat the sudden rise and gradual fall which followed the typhoid vaccine.

7 The paratyphoid A titre averaged a lower level than that of paratyphoid B after infection and after vaccine, partly perhaps because the paratyphoid A emulsions used to demonstrate the presence of agglutinins were relatively less sensitive. Consequently a low paratyphoid A titre is the more significant, Dreyer, in fact, states that an agglutination of 1-10 paratyphoid A is diagnostic.

8 In a persistent paratyphoid B carrier the paratyphoid titre showed no change in 4 months whereas in an intermittent paratyphoid B carrier the titre varied considerably.

9 Our serological tests independently confirm what Archibald found by blood cultures—viz. that in the Eastern Mediterranean paratyphoid B infections were commoner than paratyphoid A until November, after which the reverse obtained. This change in incidence was probably due to the introduction of paratyphoid A carriers with the battalions from India.

10 Twenty-eight cases—i.e., 93 per cent—failed to agglutinate typhoid, paratyphoid A, or paratyphoid B 1-25 when tested about 7 weeks after the onset of convalescence, all but 2 had been inoculated against typhoid. The majority probably had never had typhoid partly because one-third were tested 3 weeks or less after convalescence and blood cultures appear to have been made in only one instance.

11 One hundred and sixty-two cases agglutinated typhoid alone and were examined on the average 8 weeks after the onset of convalescence. Of 133 examined at least twice 11 showed a marked fall or rise in titre demonstrating that almost all, if not all had a recent typhoid infection. But even including doubtful cases, not more than 10 per cent of the 300 showed evidence of recent typhoid infection. This percentage, however would have been increased had the first examination taken place sooner, but so also would the percentage of paratyphoid cases.

12. The number of typhoid cases is evidently small because (a) a fall in titre occurred in only 25 per cent (5 per cent marked). This agrees with the behaviour of the typhoid 'inoculation' agglutinins in the paratyphoid group which fell in 17 per cent (1 per cent marked), and contrasts strongly with that of the paratyphoid 'infection' agglutinins which fell in 82 per cent (48 per cent marked). (b) The typhoid agglutinins reached a titre of at least 250 in only 20 per cent of cases. This is exceedingly small if typhoid infection had usually occurred, for the typhoid 'inoculation' agglutinins reached the same limit in 51 per cent of the paratyphoid B series (though this high level is presumably due to co-agglutination) and in 14 per cent of the paratyphoid A series.

13 The diagnosis of typhoid in the Eastern Mediterranean last summer was less reliable than at home because pyrexia of unknown origin is frequent in hot climates, because fully a third of the cases were suffering from acute dysentery, and lastly because in our experience it was only controlled by blood cultures in about 10 per cent. Serological controls were carried out in 40 per cent but such are useless and misleading in the 'inoculated' unless repeated at intervals, and there is no evidence that this was done.

14 The diagnosis as 'enteric' of cases not suffering from these diseases vitates treatment and discredits prophylactic vaccination while those who recover are regarded as potential bacillary carriers and prevented from returning to active service for months.

15 The prophylactic use of mixed paratyphoid vaccines will undoubtedly increase the difficulty of diagnosing paratyphoid as typhoid vaccine has done in the case of typhoid. The difficulty will be greatest in those mild cases which occur especially in the partly protected where the infecting bacteria cannot be demonstrated. Repeated serological tests will be of great assistance in the diagnosis. The most suitable method for routine work in war time is Dreyer's with the Oxford emulsion. It possesses the additional advantage of being a successful attempt to standardise the agglutination tests and thereby make the results from different laboratories strictly comparable.

16 As far as our opportunities have permitted we have confirmed all the statements of the Medical Research Committee's leaflet with one minor exception.

ACUTE INTESTINAL OBSTRUCTION

By GEORGE F ALDOUS F.R.C.S. EDIN.,

SURGEON TO THE SOUTH DEVON AND EAST CORNWALL HOSPITAL, AND CONSULTING SURGEON TO THE TAVISTOCK AND BODMIN HOSPITALS.

THE following notes of cases of acute intestinal obstruction I hope will be of interest. They range over a considerable area of time. Some of the causes are common some rare, but in dealing with this disease the more uncommon conditions should not be lost sight of, as in Cases 1, 3, 4 and 6. The chief factors spelling success are, first early operation, and, secondly, one or more enterotomies to reduce toxæmia.

CASE 1. *Enterospasm*—Female aged 31. There was a history of her being struck on Christmas day. Violent abdominal pains followed. I saw her in consultation at 10 P.M. on Jan 1st. All the symptoms of acute intestinal obstruction were present, rapid pulse, vomiting, and visible peristalsis. She was moved to the hospital in an ambulance, and two hours later I opened the abdomen in the median line 3 feet of collapsed ileum close to the ileo-cæcal valve was found. The remainder of the intestine, both large and small, was examined. No band stricture, or other obstruction noticed. There was no peritonitis. Appendix and pelvic organs were healthy. The case was regarded as an enterospasm and the abdomen closed. Belladonna was freely given. The patient did not improve. The abdomen became more distended. On Jan 5th (four days later) I reopened the abdomen and found that the collapsed ileum, which measured 3 feet at the first operation, was now reduced to 12 inches. Multiple enterotomies gave relief to several pints of intestinal contents and the abdomen was closed. A free action followed a few hours later in response to a turpentine and sulphate of magnesia enema. The patient made a rapid recovery and was confined, I am told, later, and is at present in good health.

CASE 2. *Adherent ileum after appendicectomy*—Female aged 25. Twelve months ago was operated on for appendicitis. She was admitted into hospital for acute intestinal obstruction. The old scar was excised and the peritoneal cavity entered at the upper angle. A loop of intestine, which proved to be the ileum was found to be adherent to the lower angle, producing an acute kink. This was easily separated, the visceral coat of intestine repaired, and dropped back. Good recovery followed, as the case was sent to hospital early before toxicæmic symptoms developed.

CASE 3. *Appendix strangulating ileum*—Female aged 46. This case I saw in October 1915. The patient was on the operating table at the East Cornwall Hospital, Bodmin and was under the care of Dr Arthur G Salmon, suffering from acute intestinal obstruction. She was thin, the abdomen was very distended peristalsis was visible and the vomit was faecal. I opened the abdomen through a central incision. Large coils of plum-coloured small intestine at once protruded. This was all wrapped in a warm towel and search made. A tight band was seen encircling a large portion of the mesentery which, on separation proved to be the appendix. This was removed, the distended gut emptied by enterotomy and the stump of appendix buried in the cæcal wall. The intestine rapidly improved in colour and the abdomen was closed. The patient left the hospital in good health three weeks later.

The previous history of this case is interesting. Twenty-six years ago (Mar 1890) Dr Salmon was called to her and found her in a state of profound collapse. No vomiting or signs of hæmorrhage were present. After 60 hours the patient recovered. In April, 1891 (11 months later), the same symptoms recurred with rapid recovery. Two weeks later she complained of cutting pains during micturition and the

right temporal bone of a three months' foetus was removed per urethram, where it was wedged. Subsequently the clavicle, femur, and other foetal bones were removed. The ribs came away without assistance. The patient continued to pass foetal bones occasionally for another 12 months. She regained her normal health, but had occasional attacks of sickness. Dr Salmon adds, in the notes from which this previous history is compiled, that the attacks of collapse for which he first saw her probably coincided with the bursting of the ectopic gestation sac into the bladder. The foetal bones were encrusted with phosphates, and he considers it a wonderful performance of nature to rectify a perilous condition.

I am much indebted to Dr Salmon and Dr R B Anderson for their help and notes in this case.

CASE 4 Appendix nipping ileum.—A child aged 2. This case was thought to be an acute intussusception. The child was passing blood and mucus. No lump could be felt and pain was chiefly on the left side. Vomiting was constant. The parietes were incised over the right rectus, and the peritoneal cavity entered through a 2 inch incision in the posterior sheath and peritoneum. On passing in two fingers a tight cord was felt between the right iliac fossa and the brim of the pelvis. This was the appendix. A loop of ileum (about 9 inches) was tightly nipped beneath it. The appendix was removed and good recovery followed.

CASE 5 Obturator hernia.—Female aged 72. A feeble old woman admitted into hospital with acute intestinal obstruction. The abdominal parietes were so thin that coils of intestine presented a curious appearance. No signs of external hernia were found and rectal examination was negative. A small incision was made in the left linea semi-lunaris at the lower third, with a view to explore the sigmoid. This was found collapsed. The incision was closed. A central sub-umbilical incision was then made, collapsed small gut was seen, and on tracing this down towards the pelvis, it was found adherent to the obturator foramen on the right side. Only a small portion of the lumen was nipped. This was released and the serous coat of intestine repaired with Lembert's suture. The patient made a good recovery. The bowels acted in a few hours and an attack of diarrhoea followed.

CASE 6 Gangrenous Meckel.—A child aged 23 years. This case was seen in consultation with Dr M Aikman. The child was vomiting and had had no action of the bowels for three days. The abdomen was distended and rigid. I regarded it as a case of acute appendicitis. The patient was admitted to a nursing home the same day. The abdomen was opened vertically over the outer half of the right lower rectus abdominis (Battle's incision). The caecum and colon were collapsed, an inflamed and partially gangrenous Meckel's diverticulum was found attached to the ileum and passing upwards and inwards towards the umbilicus. A loop of dark-coloured ileum lay beneath it, tightly strangulated. The diverticulum was dealt with and the child made a good recovery. In this case the large intestine was shrunken to the size of a lead pencil and I had serious doubts as to the possibility of it regaining its function.

CASE 7 Ruptured uterus with gangrenous intestine.—Female aged 41. The history of this case is brief. The patient was admitted to the Bodmin Hospital in a collapsed condition, having been brought a considerable distance by motor car. She was confined 48 hours previously and great difficulty was experienced in delivery. Intestine was protruding from the vagina. No action or flatus had passed. The abdomen was distended. Vomiting was urgent. I saw her a few hours later and, assisted by Dr Anderson and Dr Salmon, opened the abdomen. The peritoneal cavity was full of blood, the uterus was ruptured posteriorly, the rent being 3 inches long. Subtotal hysterectomy was performed, leaving both ovaries and the stump covered in the usual way. The pelvis was then examined, and 2 feet of small intestine was found in a gangrenous condition, quite separated from its mesentery. This was rapidly excised, division extending well into normal gut, and joined up by the simple suture. The mesentery was laced up, and the parietes united in layers. No rise of temperature followed, the bowels acted well in the course of a few days, and the patient left the hospital quite well in three weeks.

CASE 8 Carcinoma of colon and ovarian cyst with twist of pedicle.—Female aged 25. This patient was seen in consultation with Dr R Simpson. She had suffered for the last few days from constipation and had some pain in the left iliac fossa. This was dull on percussion, the right side being resonant. Enemas and aperients failed to produce any relief and she was admitted into a nursing home. On opening the abdomen an ovarian cyst with a twisted pedicle occupied the left iliac fossa extending upwards towards the left side. This was removed without tapping. The caecum was tightly distended. It was necessary to extend the incision upwards nearly to the ensiform cartilage in order to trace the large intestine. A malignant growth was

found at the hepatic flexure, completely blocking the lumen of gut. A mass of glands was present in the mesocolon. Relief to obstruction was given by a caecostomy and the abdomen closed, and a few weeks later ileo-colostomy was performed. The patient left the nursing home in six weeks the bowels acting well, and health gradually improving. The ovarian cyst was of semi solid consistence. Dr W I Pethybridge reported that the ovarian tumour was an adenocarcinoma, and probably primary, the growth in the colon being secondary.

CASE 9 Hernia, reduction en masse.—Male aged 47. The patient was sent to the South Devon Hospital by Dr H Davis, of Callington, for acute intestinal obstruction. The man was very ill, vomiting everything taken by mouth. No flatus had passed for some days. On examination a small lump, the size of a walnut, was felt just above the internal abdominal ring on the left side. No external hernia was found, and examination of the rectum revealed nothing abnormal. The small lump referred to felt like, and was thought to be, a gland. Incision was made vertically over this, and a small knuckle of gut was found tightly nipped. This was dealt with and good recovery followed. I consider that the man had had an inguinal hernia which he had reduced en masse.

CASE 10 Omental adhesion.—Male aged 47. This patient was a powerful, well built man, sent by Mr T A King of Bude, suffering from acute intestinal obstruction. He was vomiting everything taken by the mouth, and there had been no action for five days. The abdomen was tightly distended. He had been in hospital six years ago and had had three operations, one being a colotomy which was afterwards closed. Unfortunately no notes were available. There were three scars—one long median extending beyond and obliterating the umbilicus, and one right and left inguinal. The central site was chosen, and on opening the peritoneum an enormous bulk of large intestine presented, this was easily turned out into a warm towel. A long, rope-like cord of omentum was attached to the upper angle of the incision. This was tied off to the extent of 7 inches. An enterotomy of the colon evacuated a quart of liquid faeces, and the small incision was closed. A similar opening was made in the distended small intestine, with relief to a quantity of gas. These two enterotomies permitted the easy return of intestine. The appendix was normal. The abdomen was then closed, the bowels acted naturally within a few hours, and he left the hospital quite well in three weeks. I do not know what the patient's original condition was for which a colotomy was performed, but the omental adhesion was the cause of his obstruction when he came under my care.

In the treatment of acute intestinal obstruction I cannot urge too strongly the importance of early surgical interference. If this is objected to by the patient, or by his or her relatives, the danger of delay and lessened chance of a satisfactory result should be clearly pointed out. Nannyn (quoted in Keen's Surgery, vol iv, p 645, collected 288 cases of acute intestinal obstruction which showed recovery in 75 per cent when operated on the first or second day, but failing to 35 per cent if delayed to the third day. I quite admit the occasional difficulty of diagnosis but surely it is safer to open the abdomen when acute symptoms are present than to wait. Plymouth.

IMMOBILITY AFTER JOINT INJURY

By SIR JOHN COLLIE, M D ABERD.

HONORARY PHYSICIAN, COUNTY OF LONDON WAR HOSPITAL, ETON.

MANY men who have had accidents at or in the neighbourhood of a joint draw sick allowances from industrial clubs, insurance companies, and the State long after all inflammation has subsided, and when there is no apparent reason why pain should be complained of. The suspicion of malingering not unnaturally arises in the mind of those who have to pay, and a medical opinion is sought where it is assumed there is a *prima facie* case of fraud. The vast majority of these cases are, however, not fraudulent, but are the result either of mismanagement by those in charge of the case or of the patient having adopted his own treatment.

At one time it was almost the universal practice of the medical profession to keep joints fixed for many weeks after the reduction of a dislocation and to allow splints to remain on fractured limbs until the muscles had wasted and strong fibrous bands had fixed the adjacent joints, this bad practice is still common. Large numbers of these cases subsequently apply to bonesetters, and many are cured.

It is scarcely fair to blame the public if, not having obtained relief from regular practitioners, it deliberately takes the small risk of having adhesions broken down and resorts to irregular practitioners for this purpose. They occasionally come across unreduced dislocations but since the discovery of X ray photography their number must be few. Perhaps more frequently bonesetters replace dislocated semilunar cartilages where regular practitioners have failed.

Many believe that the bonesetter lives by fraud and chicanery that every joint he is asked to treat is said to be "out," that he gives a mysterious twist of the limb surreptitiously cracks his fingers in the neighbourhood of the joint and, *heigh presto!* an "unreduced dislocation" is cured. Now in most cases the patient is cured, but not by the reduction of a dislocation. The swift accurate, and definite movements are those necessary to break down the fibrous bands that always form round joints which have become stiff for want of passive movements.

Many bonesetters administer an anæsthetic daily for a few days after the initial operation to overcome the muscular resistance. People who go to bonesetters do not mind the risk and the expense but a second anæsthetic is quite unnecessary for carefully regulated exercises although a little painful at first are all that are required to complete the cure. I have seen a large number of joints both in civil and military practice some of them temporarily and many permanently disabled because the surgeon in charge has failed to appreciate that immobilisation of a joint is inevitably followed by adhesions. It is not sufficiently recognised that the longer adhesions are allowed to remain the greater the risk is of permanently impaired function. This is especially common where a shoulder joint has been dislocated or where a knee joint has been the subject of a mild form of traumatic synovitis.

Adhesions sometimes take place at a joint which has been fixed so short a time as three weeks. They may bind together the articular surfaces and the folds of the synovial membrane in the joint, or they may be entirely outside the joint. The surrounding tendons may become adherent to their sheaths as the result of teno-synovitis.

Adhesions form in the shoulder joint in the capsular ligament over the bicipital groove—where an adventitious band is sometimes found in connexion with the sheath of the long head of the biceps—and over the deltoid bursa, at the elbow joint from the tip of the internal condyle of the humerus corresponding to the fan shaped internal lateral ligament, at the knee the bands adhere to the internal semilunar fibro-cartilage and the internal lateral ligament.

When estimating the mobility of the shoulder joint the scapula should always be fixed. After adhesions in the shoulder joint have been broken down the arm must on no account be put in a sling. I find a very good method of inducing patients to extend the shoulder joint is to place them face forwards against a closed door with the palms of the hands against the door. They are instructed to make both hands gradually creep up by muscular action of the fingers against the support of the door until the hands are well above the head. The gradual slow, and comparatively painless upward gliding of the hands always produces a fascination in reaching a higher point which has generally a very happy result. This movement is much more easily performed than raising the hands apart from the support of the door for the strain on the deltoids is not so severe and the upper extremity is raised partially by the assistance of the muscles of the forearm.

The after treatment of accident cases for which the State or an insurance company or an employer is responsible is always difficult to carry out. Amongst a certain class of employers there is a feeling of resentment against the employer especially if as sometimes happens the injury is the result of want of proper care on the part of the employer—as for instance where a faulty rung of a ladder has been discovered to have been the cause of the accident. The patient perhaps not unnaturally thinks that it is his loss to see that now the initial suffering is past he shall not be submitted to any further pain or inconvenience of any sort and that if he does not fully recover his master must be the consequence. Apart from this short-sighted point of view it should not be forgotten that many of these people have already suffered much both physically and mentally as the result of their accident and that the responsibility for the fact that an operation for breaking down adhesions is

necessary is not that of the master the patient, or the insurance company, but comes a good deal nearer home than many members of our profession care to admit even to themselves.

Attempts are sometimes made to break down adhesions under nitrous oxide gas but with it complete muscular relaxation cannot be obtained, and the results are unsatisfactory. I never advise men of the working class who are suffering from adhesions in or round a joint to submit to treatment in the out-patient department of a hospital. For although the operation itself is comparatively trivial, and it would appear at first sight to be one eminently suited for the out-patient ward, experience shows that subsequent to the operation the daily forced passive movements upon which success or failure depends cannot be secured in this way. The only satisfactory treatment for these cases is to obtain admission to hospital, and fortunately only a few days' stay is necessary.

The way not to succeed in a case of this sort is to send such a case to the out-patient department of a hospital, to have nitrous oxide gas administered sufficiently deep for a dental extraction, to have the limb bent as far as the opposing muscles will permit and then to instruct the patient to attend as an out-patient at intervals to be massaged by a nurse two or three times a week. The anæsthesia is not sufficient the operation cannot be complete, the patient may or may not attend for the massage, and in any case it will be useless for the patient will assuredly not permit of any passive movements which are in the least painful at the hands of anyone except a surgeon.

Mr Romer who has made a special study of this subject, points out that when adhesions have to be broken down an anæsthetic should always be given, not so much for the purpose of avoiding pain as of ensuring the complete relaxation of the muscles, otherwise the muscles which will be involuntarily brought into action may be injured by the force necessary to break down the adhesions. He points out that sufficient muscular relaxation cannot be obtained by nitrous oxide gas, and that it should never be relied on. The elder Hutton the bonesetter necessarily performed his operations without an anæsthetic, and he overcame the resistance of the muscles by rotating the limb on its own axis for a considerable time. The rationale of this movement seems to be that by throwing the muscles out of their ordinary lines of action they are for the time rendered powerless.

When adhesions give way there is no mistaking the result of forcible movement—the loud crack or the less highly pitched crunch, or it may be merely a tearing sound indicate to some extent to those who have much experience the duration of the adhesions. Pain which follows the operation is insignificant and seldom lasts more than an hour. The important point is that unless the medical man who undertakes this comparatively simple operation is prepared to carry out the after treatment on scientific lines it is infinitely better for his patient and himself not to undertake it. Prior to the necessary passive movements of the joint which should be commenced within a few hours of the operation the muscles in the neighbourhood of the joint should be skilfully massaged. It must never be bandaged and to apply a splint is folly. If the joint is not manipulated within 24 hours the ruptured adhesions will re-unite.

If the injury done to a joint were merely that fibrous bands formed the damage done could be in most cases comparatively easily repaired by breaking down the adhesions. But prolonged immobility to a joint necessarily entails muscular wasting which is the result partly of disuse and partly of nervous reflex action set up by the original injury to the joint. To restore the muscular wasting special simple exercises are always most useful. The ordinary physical exercises of the gymnasium instructor, so useful in health, are not suited for these cases. The anterior middle, and posterior fasciculi of the deltoid for instance, more the humerus in different directions and it is obvious that if a few of the anterior fibres are lacerated the exercises useful for the development of all the muscles of the upper extremity such as the use of dumb-bells &c., cannot be appropriate.

Wharton Hood has pointed out that any movement which causes pain will not only be avoided but whenever circumstances call for any approach to it the stronger portions of the muscle will be thrown "on guard" to protect the weaker

parts from going into action. Thus the exercise will fail. The secret of success in all these cases is to give the muscle very light work at first, for instance, in the case of the upper extremity the gradual lifting of a weight by means of a handle, rope, and pulley is more effective than forcible but indiscriminate movements. The weakened portion is coaxed, as it were, to take part in a light movement whilst it would rebel to attempt even to lift a heavy weight. The size of the weight should be gradually increased.

The author whose views I have just referred to observes that a few days of such treatment "will generally suffice to bring the specially weakened portions of a muscle into line with the remainder, and to get rid of any pain which the earlier efforts may have caused. When this has been accomplished the muscle may be exercised more freely, and as a whole, and the weights employed may be increased. All that is necessary in the first instance is so to arrange the exercises as to furnish a movement in which the weakest part of the affected muscle must take its share, and to do this in such a manner that the movement in question is started, and in its course is facilitated by the descent of the weight which the opposite action has drawn up."

Porchester terrace W

EXTRACTION OF BULLET FROM MIDDLE MEDIASTINUM

By L. E. BARRINGTON-WARD, CH. M., F.R.C.S. EDIN.,
F.R.C.S. ENG.

HONORARY SURGEON TO THE KING GEORGE HOSPITAL AND (WITH CHARGE OF OUT-PATIENTS) TO THE GREAT NORTHERN CENTRAL HOSPITAL AND THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND-STREET

The following case of bullet lying in close relationship to the pericardium presents several features of interest

Private —, aged 33, was wounded in France in September, 1915. The bullet entered the left side of the chest in the mid-axillary line. There was no wound of exit. He was detained in hospital for six weeks and the wound healed uneventfully. In February, 1916, he was passed fit for general service again and rejoined his regiment in France. He suffered from sharp pains in the chest with palpitation and shortness of breath on marching. Accordingly, in April, 1916, he was sent to hospital at E—. A radiogram of the chest was taken and the diagnosis was made of bullet in the pericardium. He was sent back to England as unfit for service and on April 28th was admitted to the Great Northern Central Hospital. On examination he appeared to be a healthy man with no symptoms while at rest. He stated that exercise gave him sharp pains over the præcordia, with attacks of breathlessness. There was a healed wound in the mid-axillary line in the seventh inter-space. The heart and lung sounds were normal. A radiogram showed a bullet apparently lying in the pericardium near the left border of the heart just above the diaphragm. On screening, movements of the bullet due to cardiac and respiratory excursions were well seen. It was thought that the bullet lay in the pericardial cavity, possibly attached to the pericardial wall.

An operation was performed for its removal on May 9th. Dr. W. A. E. Dobbin administered chloroform with the Vernon Harcourt apparatus. An incision was made in the mid line of the sternum from the level of the fifth costal cartilage downwards to the sixth costal cartilage and then along the sixth costal cartilage outwards. The sixth costal cartilage was removed. The internal mammary was ligatured and the triangularis sterni muscle, which was poorly developed, divided. The left lung and pleura, which overlaid the pericardium as far as the left border of the sternum were pushed aside and the pericardial cavity was opened. It was intended, if more room was required, to reflect outwards a flap of the fifth, fourth, and third costal cartilages with the overlying soft parts. It was found, however, that the removal of the sixth costal cartilage gave a surprisingly good view, and through this incision it was possible to palpate thoroughly the heart and explore the pericardium. The bullet could not be felt. It then appeared likely that it was lying on the pleural side of the pericardium. The lung and pleura were gently separated off the pericardium and at a depth of about 4 inches from the surface the bullet was found adherent to the pericardium and also to the pleura and lung. It lay surrounded by a few beads of pus, with its long axis applied to the pericardium, apex forwards. The pleura was adherent to the lung in this situation and this fact undoubtedly prevented any extensive collapse of the lung. The bullet was extracted, the pericardium closed with fine

catgut, the muscles were brought together, a small rubber tube was inserted superficially, and the skin wound was closed with Michel's clips. The anæsthetic was admirably taken throughout and no change in colour and no respiratory or cardiac embarrassment was noted except when the pericardium was pulled forward for suture. This traction on the pericardium caused slowing of the respiration.

Recovery was uneventful. The tube was removed in 4 hours, when some deficient movement of the left side of the chest was noted. The respiration rate rose from 25 before operation to 32 on the second day and fell back to 24 on the fourth day after operation. Pulse and temperature were hardly affected. On the fifth day the skin clips were removed and the wound was healed. On examination 10 days after operation the expansion of both sides of the chest was equal. A faint friction rub could be heard over the fifth interspace to the left of the sternum. No differences from the normal could be detected on either side of the chest. Examination 14 days after operation showed both heart and lung sounds to be clear.

Radiogram showing position of bullet

Interesting points in this case are —1 The narrow escape of the patient from a fatal injury when wounded. Presumably the fibrous pericardium was sufficient to stop the career of a spent bullet. 2 The radiographic examination. The cardiac movements transmitted to the bullet as well as the respiratory movements showed that the bullet was in intimate relationship to the pericardium. It was difficult to say on which side of the pericardium the bullet lay. The radiograph rather suggested the cardiac side. 3 The comparative freedom with which heart and pericardium could be examined without embarrassment under an inhalation anæsthetic. 4 The possibility of separating the pleura off the pericardium without any recognisable collapse of the lung taking place. The pleura blew out into the wound with each inspiration.

I am indebted to my house surgeon, Miss Miall Smith, for her good assistance and care of the case, and to Dr. J. Morison for the invaluable aid of the X rays.

Harley-street W.

"INCREDIBLE MEANNESS"—At the last meeting of the Barnstaple (Devon) rural council a letter was read from a medical man in reference to the reduction of notification fees from 2s 6d to 1s. The writer stated that after allowing for the cost of sending "snobs" for bacteriological examination only 4s 6d remained to the medical attendant for his time and trouble, and he added that if the council refused to pay the postage the writer would not send any more. The letter was written as a protest against the incredible mean-ness of the Local Government Emergency Legislation Act.

CESSATION OF TACHYCARDIA ON THE OUTBREAK OF SPONTANEOUS PERSPIRATION

By SIR THOMAS OLIVER M.D. GLASG., F.R.C.P. LOND.
PROFESSOR OF THE PRINCIPLES AND PRACTICE OF MEDICINE,
UNIVERSITY OF DUREM COLLEGE OF MEDICINE,
NEWCASTLE UPON TYNE.

RECENTLY I saw in consultation with Dr S. D. Metcalfe of Benwell Newcastle-upon-Tyne, a man of sedentary employment aged 28 years, the subject of tachycardia, who had rapidly become cyanosed and who was dangerously ill. The patient, a well built man and married, had three days previously when at work, been seized unexpectedly with vomiting and immediately afterwards tachycardia developed. The vomiting kept recurring and was rather a distressing symptom. This was not the first occasion on which the patient had suffered from such a seizure. Eight years ago, just before his marriage he had an attack, three years ago he was similarly held, and since then he has had minor seizures but with the exception of the original attack, to be subsequently mentioned in none of them had he been so severely held as in this last. Until his recovery from this last attack no explanation of the seizures was forthcoming. It now appears that at the age of 15 after running a few miles during which he stumbled twice from exhaustion, his heart began to beat violently and the beats were quickened. For two days after running he lay in bed unconscious. The patient is extremely anxious and is only a light smoker. There is no rheumatic history, nor is there any abnormal physical condition of the body ascertainable through which the attack could be regarded as having developed reflexly.

When I saw patient he was lying in bed, calm and composed. There was no indication of nervous excitement and considering the rate at which the heart was beating there was an absence of respiratory distress. The face was pale and although the lips were cyanosed the blueness was less than it had been two to three hours previously. The pulse was extremely rapid, about 200 per minute, not all the pulsations reached the wrist. On examining the heart the apex beat was felt fully one inch external to the nipple line and slightly higher up than usual. At and internal to the apex beat a loud blowing systolic murmur could be heard but no second sound, while external to the nipple line in addition to the systolic murmur, a faint but normal second sound could be heard. The systolic murmur was audible over the lower part of the sternum also over the base of the heart where it was followed by a feeble second sound. Over the precordium generally all that could be heard was an almost constant blowing, systolic murmur. The area of cardiac dullness was increased transversely. The lungs were normal. There were marked epigastric pulsation and an enlarged liver. The urine was normal. There was neither oedema nor rise of temperature. A moderate amount of sleep and physical quietude had been secured by the hypodermic administration of morphia, strychnine and digitalin. As vomiting still continued an effervescent soda, bismuth bromide and belladonna mixture was ordered and this gave relief.

Dr Metcalfe who had examined the patient shortly before the attack was able to assure me that the heart was at that time normal and that the apex beat was then inside the nipple line. Within three days therefore this man's heart had rapidly dilated, the left ventricle had expanded as shown by the situation of the apex beat and the right had dilated as indicated by the epigastric pulsation while the widely distributed systolic murmur was additional evidence of an increasing enfeeblement of the myocardium generally.

The patient's condition was sufficient to cause anxiety on account of the recurrent vomiting and the expectation of cramps upon pallor. Later on during the evening of my visit peristalsis broke forth. Shortly after this the patient lay up in bed and I said now that he had begun to sweat he knew from past experience he would soon be better. His expectations were confirmed but not until another experience of previous attacks had become realised in the advent of pain located over the marbrum sterni and base of the heart. A period of a series of great difficulty of breathing as the heart of the heart dilated and the pulse-rate fell.

Having this presage of recovery the patient had on the whole a comfortable night.

Next morning the pulse had fallen to 74 epigastric pulsation had disappeared the systolic murmur was inaudible, and the apex beat had slightly receded. The rapid decline of the tachycardia and disappearance of the physical signs of cardiac dilatation upon the outbreak of spontaneous perspiration are the main features in the case. It is not unusual for tachycardia to suddenly cease. This has been known to occur for example, after the emission of a large quantity of urine.

We searched for an exciting cause of the attack of tachycardia in our patient but without success. The illness came with a vomiting, and it disappeared with a perspiration, for two days the perspiration continued. The thyroid gland was normal so that the influence of an internal secretion from this gland can be ignored. The view we took at the time was that the attack was one of central origin and due either to loss of vagal control or to increased discharge from the accelerator nerve centres. There was nothing to indicate that the attack was consequent upon any primary derangement of cardiac ganglia, for although several of the pulse beats failed to reach the wrist this circumstance did not seem to point to extra auricular systoles so much as to failure of the driving power of the left ventricle. The bundle of His when it has undergone fibrosis is said to cause tachycardia, so too does arterio-sclerosis of the cardiac coronary arteries but the rapidity with which the symptoms and physical signs disappeared also the outbreak of spontaneous perspiration, point to functional derangement of the central nervous system. I have seen tachycardia cause death through myocardial and general exhaustion. In our patient there was never any of the sense of dread or distress which are sometimes observed in angina pectoris.

Newcastle-upon-Tyne

Medical Societies

ROYAL SOCIETY OF MEDICINE

SECTION OF SURGERY

Treatment of Convalescent Soldiers by Physical Means

A MEETING of this section was held on July 21st Sir RICKMAN GODLEE, K.C.V.O., being in the chair.

Sir RICKMAN GODLEE announced that Sir Alfred Keogh Director-General, had written expressing his regret that he could not be present, as he had hoped, and stating that General M. W. Russell was representing him at the meeting. Sir Rickman Godlee extended the welcome of the society to the staffs of the medical services of the four colonial contingents, and invited them and any other visitors to take part in the discussion should they so desire.

Major TAIT McKENZIE, R.A.M.C. read a paper on the Treatment of Convalescent Soldiers by Physical Means. He said the military general hospital was very much like a general post-office in one respect for in the latter the material was sorted out into first-class, second-class and third-class matter. The first-class matter in these hospitals was distributed to various hospitals for operation or other treatment and usually found its way back into the firing line within a month or so of the commencement of the disability. It was usual for the second class matter to stay a little longer in a convalescent hospital but most of these patients were back at the front in the course of six or eight weeks. But there remained the third class matter which was not brought back by these two processes. At the beginning of the war this material accumulated in various depots and became an increasing encumbrance to the military authorities. It was to provide for this class of case which could not be brought back in a few days or weeks or within six months that the Command Depot was established. His own experience was obtained at the Heaton Park Depot. In the first year of the war many urgent matters required attention that the Director-General was unable to provide for the situation until the Command Depot was established for the reception of the more prolonged cases. This convalescent hospital was under the Royal Army Medical Corps and a limit of six men was placed on the time necessary to treat the

cases The prime object of the Command Dépôt was to return the patients to active service. If that could not be done, the next best thing was to get them fit to serve on lines of communication abroad. Failing even that, they aimed at getting the men into some sedentary work which was useful to the Army at home. If none of these purposes could be accomplished in the case of any patients, then the object was to remove them from the Army as soon as possible. The sources from which the men in the Command Dépôts came were various, and included convalescent hospitals and the dépôts of various regiments, and the kind of case varied with the source. There were a very large number of nerve cases, men suffering from various forms of shock, cases which were tremulous, which stammered, which had either diminished or increased sensitivity, those who suffered from breathlessness and from rapid and dilated hearts owing to over exertion. There were also many cases of supposed rheumatism and of real rheumatism, cases suffering from the after effects of gas (bronchitis and asthma), and patients with debility following the serious dysentery which was prevalent at Gallipoli, enteric, and malaria. In the dépôt to which he was attached there was also a constant stream of wounded, men who had been shot in every conceivable part of the body, and those suffering from contractures, stiff joints, and very painful scars. There were usually 2000 or 4000 cases in each dépôt and the treatment carried out was largely that which came under the heading of physical therapy. This included electricity, hydrotherapy, radiant heat, massage, passive exercise, mechano-therapy, and progressive physical training. It did not follow that because a case was having massage it should also have passive movement or active exercises. If the scar tissue were not properly organised these movements were liable to break it down again, the inflammatory process might be renewed and the last state of such a patient would be worse than the first. The electrical equipment consisted of the three forms of current usually supplied by the polystat. The faradic was mostly used in the diagnosis of nerve injury, for the treatment of functional heart trouble, and to stimulate wasted muscles. By the employment of the condenser the current was rhythmically interrupted and its intensity varied, and in cases which did not permit of movements being carried out it formed a good substitute for them. Arm and leg baths through which the galvanic current was passed were found useful for weakened limbs for some cases of frost-bite, general conditions of impaired circulation and for the softening of scar tissue by ionising with sodium chloride and iodide of potassium. The less irritating sinusoidal current was of value in maintaining nutrition of muscles whose nerve supply was defective. The electrodes used were copper wire mesh adjusted to fit the thigh, leg or other special region, the electrode being covered with felt. Naturally when dealing with such large numbers of men, the prescriptions were carried out more or less in classes, and every care was taken to supervise their operation, otherwise the effort was wasted. With the help of the Committee on Balneology of the Royal Society of Medicine the ordinary hut had been converted into an ideal hydrotherapy establishment. The hot or cold stimulating douche had been useful not only in treatment but also in diagnosis of the real nature of cases of supposed rheumatism. The serious cases of rheumatism were treated in the sub-thermal tub bath, the 20 minutes' immersion in this at a temperature of 94° F. being followed by general massage. The large pool bath, capable of immersing up to their necks 12 men at a time, was kept at a temperature of 94°. The stay was one hour on each occasion. Cases of shock and disordered heart were given this bath as a routine measure. For patients with painful scars or frost-bitten feet a whirlpool bath, in which the water was kept violently agitated, was given at a temperature of 110°. For painful limbs the urging of compressed air into the stream provided a comforting effervescent envelope. Twenty minutes of this produced a flushing with blood, the circulation remained enhanced for hours, and the patients experienced a definite sense of relief. It also constituted an excellent preparatory course for for the scar to be softened dry heat was applied by means of radiant-light baths. The Almeric Paget Massage Corps had supplied trained masseuses and each operator could treat 20 cases daily. Recently the massage staff had been strengthened by the addition of the first graduates from

St. Dunstan's who had been blinded in action. Only those who had been carefully trained should be allowed to carry out this important work. As massage progressed it was supplemented by passive manipulation. The necessary re-education of affected muscles and joints was, to a large extent accomplished by arranging tasks of progressive difficulty. At his dépôt specially designed weight-and pulley machines were in use for this purpose. Later free gymnastics threw the patient more on his own resources. Men at this stage were joined by those suffering from shell shock, those able to do only very light exercises, and debilitated convalescents from enteric or dysentery. These progressed together to the stage, if possible of full physical training. Not more than 30 per cent. of the cases of disordered heart's action could be brought back to class A, as arduous work brought about a relapse in most of them. And the bronchitis which had been started by exposure to gas was frequently reawakened by a forced effort to run and jump. The orthopaedic, the puzzling nerve conditions and other obscure cases could now be referred to the established special hospitals. The results obtained in the Command Dépôts fully justified their establishment. At Heaton Park half the patients had been rendered again fit for active service and had rejoined their units in the fighting line, 12 per cent. had been sent to the lines of communication abroad, 12 per cent. to useful sedentary work at home while the remaining 28 per cent. had been discharged as "permanently unfit". The eight Command Dépôts had since their establishment, returned a full Army division to the fighting line. The average time these men were under treatment had been less than three months, and many of the cases which could not be restored to category 'A' yet had their opportunities for a useful career in civil life greatly increased by the treatment. Major McKenzie finally expressed his indebtedness for help rendered to him by his assistants.

Lieutenant-Colonel R. J. MORRIS (of the Command Dépôt Ripon and of Harrogate) pointed out that Professor Ling more than a century ago co-ordinated and elaborated physical exercises as a definite treatment of suitable conditions. These remedial exercises were divisible into active, passive, and duplicated. In the last of these the work was partially done by the patient, another person providing the resistance. In his experience at Ripon the physical means had proved to be the most efficacious. Since November, 1915 over 76 per cent. of the men in his dépôt had been returned to service. The physical means used there were massage, remedial gymnastics without apparatus (conducted by experienced masseurs and masseuses), exercises with apparatus (such as massed bicycle exercises, rowing machines, grip dumb-bells, fixed bicycle exercises, rowing machines, grip dumb-bells, graduated weights) and stimulation of nerves and muscles by galvanic and faradic currents rhythmically interrupted and reversed on the Bergonié system. This latter was particularly useful on account of the trophic effect of impulses passing through the motor nerves. When the patients were able to endure more strenuous exercises members of the Army gymnastic staff from Aldershot took them in hand, under the supervision of a commissioned officer in that service. Owing to the mental condition of the patients due to their experiences the work called for much patience. Many cases were sent much too late. He considered that Command Dépôts were excellent institutions, and even better results would be obtained by them when they were more generally known among the authorities who were responsible for sending the cases.

Dr W. BEZLY THORNE recommended mineralised baths for irritable heart and rheumatism. He had had cases of trench rheumatism scarcely able to move after treatment by radiant heat, massage, and the internal administration of salicylates who yet were placed entirely on their feet by means of mineralised baths and exercises especially if instead of drying the patient after taking the bath he were allowed to dry gradually in his blanket. He gave some instances of successful results thus obtained. In cases of irritable heart and muscular tremors care should be taken to avoid long immersions.

Dr R. FORTESCUE FOX thought the reports of the work by Colonel Morris and Major McKenzie most opportune and the whirlpool baths were a new feature so that nothing very dogmatic could yet be said about them, but there was every reason to consider that at high temperatures and for long periods they materially assisted the moving of

immobilised limbs. He emphasised the importance of actively insisting on mensuration in these cases periodically from the commencement as it would greatly aid a satisfactory solution of this difficult question. The Balneological Committee of the Society considered it very advisable to have, in all places where physical means were employed for wounded soldiers, a uniform system of record, so that the opportunities for study and the advance of medical knowledge furnished by the war should not be neglected.

Colonel ROPP (Canadian Hospital, Ramsgate) said that at his depot at Ramsgate practically the same classes of cases were seen as Major McKenzie had described, though mostly at a rather earlier stage. As in all other departments of medicine, the important matter was the diagnosis and at Ramsgate a special medical board paid particular attention to this. In six weeks quite a considerable number of myopathic and neurasthenic cases were found to have tertiary syphilis and the recognition of this and the immediate application of appropriate treatment soon resulted in those men being back in the firing line. The apparatus used at the depot had been constructed very cheaply, and was quite efficient for the purpose. He described the method of graduation towards fitness which was carried out, ending with instructors who took the men on route marches and others who had charge of them on the playgrounds, the men being required to spend two hours per day at play of some kind. They could not work at the light duties allotted to them more than four hours per diem and they must not work less than two hours. This limitation was necessary, as some of the more eager were willing to put in eight hours daily. A series of periodic checks by medical officers were carried out to ensure that patients while not being overtaxed were making the best possible progress towards recovery.

Dr E. P. CUMBERBATCH thought the subject of the treatment of injuries and wounds inflicted in war had received only small attention in Major McKenzie's address for he made no mention of treatment by those most important electrical methods—diathermy and the high frequency current. He wished briefly to refer to what Major McKenzie spoke of as 'third-class material'—i.e. cases of paralysis of muscles and nerves which would be left after the war had concluded. These could be appropriately called fourth class material. In the electrical department at St Bartholomew's Hospital he was seeing cases which had been discharged from the Army and were attending for further treatment of paralysis due to nerve injuries received earlier in the war. Cases which had had injuries to nerve trunks would even under the best treatment require attention for 18 months or longer before the return of some degree of power and he considered that the best treatment of such cases was by baths supplied with the rhythmically varying sinusoidal current. In his department at the hospital a series of such baths had been in operation for nine years and the results in the treatment of cases of paralysis following nerve injuries and diseases of nerves were uniformly good.

Major W. J. TURRELL (Oxford) said it had been most interesting to him to hear Major McKenzie's paper as it treated the subject from the general standpoint of physical therapy which included many subsections that often were not correlated. The present contribution scarcely exhausted the possibilities of modern electro-therapy. A most important method of treatment was by diathermy. When a continuous current was interrupted muscular contractions ensued, but when their frequency exceeded 500 per second no visible contraction occurred and the patient was not conscious of any sensation. From the ordinary high frequency current benefit had been derived for a great many years. The whirlpool bath and various forms of hot bath affected the surface of the body or limb only whereas in diathermy the current proceeded direct through the tissues. Interesting between the two electrodes and the beneficial current could be brought to bear on any part of the system. That was a great advance and it had been very successful for both to and for the relief of acute pain. It was perfectly safe to use and it 'satisfactorily warmed up tissues' as a preliminary to massage. He quoted figures from his technical department at a Madcliffe Infirmary, Oxford, and pointed to point on the advantage in certain cases of the electric machine the violent contractions so produced could be an efficient anodyne of the muscles, it also

cleared up joint effusions and phlebitis and liberated fibrous adhesions. The Bergonié system was also useful for the same kind of case. These further developments of electrical methods were well worthy of consideration in the treatment of wounded soldiers.

Dr W. GORDON (Exeter) said the Command Depôts had been long hoped for. There were a deplorable number of cases which had been transferred from one place to another until the stage at which most good could have been accomplished had passed. He had great faith in treatment of some forms of injury by means of hot sand, some cases derived more benefit from that than from the application of radiant light or heat. With regard to the use of mineralised water for remedial baths he was told at a large establishment in the north of Paris that it was of no consequence whether the water was sulphurated or not. He agreed as to the benefits of employing a proper periodic system of mensuration. It assisted in accurate diagnosis, ensured that the best treatment was being applied at each stage, and enabled one to confidently apply the right method to each class of case owing to the results already obtained in similar ones. He did not favour too great an economy in the setting up of the necessary apparatus.

Dr R. ACKERLEY (Llandrindod Wells) said he had been treating cases of injury and nervous disease by physical means for more than 20 years and in his view the great object to aim at was to overcome defects of circulation by producing active congestion in the affected part. If the patient was to be spared pain one must begin with passive movements, active movements should not be the first stage. The presence of pain was sometimes the only obstacle to movement, and this pain must be removed in the best way. Some cases were successfully treated up to the point of taking short walks, and he suggested that such cases should be sent to places where they could have Swedish exercises and then be trained to march with their full pack.

Major McKENZIE briefly replied. He said that they had no facilities in the Command Depôts for mineralising the baths, reliance was placed on the temperature. The benefits obtainable from the high frequency current were still so much a matter of dispute that it was questionable whether it was justifiable to instal an expensive apparatus for that form. The Bergonié system was in full operation at Ripon under Lieutenant-Colonel Morris.

SECTION OF DERMATOLOGY

Exhibition of Cases

A MEETING of this section was held on July 20th Dr J. H. STOWERS the President being in the chair when the following cases were shown—

Dr E. G. GRAHAM LITTLE 1. Xanthoma Tuberosum. Lesions commenced on the right elbow two years ago, since when they have appeared on the left elbow, knees and in the sacral region. The urine was natural, nothing else abnormal was discovered and no other member of the family was affected. 2. Acne Urticata of Kaposi. The lesions appeared as diminutive papules resembling millet seeds in the skin. The itching was intense which made the patient scratch and pick the seed like bodies out. Excoriations and bullæ resulted. When certain lesions had healed others reappeared in the same situation. The extremities and not the face were involved.—Most of the members thought the case was either one of lichen planus with bullous lesions or dermatitis herpetiformis.—3. Urticaria Pigmentosa in a male aged 34. The patient had had the condition for 17 years.

The PRESIDENT. Lupus Vulgaris in a female aged 19. The initial lesion was a small ulcer in the mouth which first appeared in 1912. Since then lupus nodules had appeared on the skin around the mouth, other ulcers in the mouth, and tuberculous adenitis in the neck had also supervened. The right cheek was now much swollen owing to the presence of a dense infiltrated mass of tuberculous tissue. Although most of the recognised forms of treatment, including X rays and Finster light had been frequently applied, the patient's present condition had not materially improved.

Dr G. FINSTER. Dermatitis Herpetiformis in a small boy aged 5. The patient had had several recurrences since the disease first started two years ago. The trunk, front and back was involved but there was no pruritus.

Dr W. KNOWLES SILLER 1. Urticaria Pigmentosa in a man aged 10. The duration was only two months and

the patient did not complain of itching 2. Nævus with Ulceration The patient was a man, aged about 20, with a congenital nævus and partial gigantism of the region of the right knee-joint In connexion with the nævus were patches of ulceration and pigmentation.—Dr F PARKES WEBER considered the case to be one of multiple pigmentary sarcoma of Kaposi.—3 Case for diagnosis Patient had had for 12 years on hands, knees, and ankles lesions closely resembling lichen planus There were other lesions which were raised, hard, and not unlike warts.—Dr H G ADAMSON pointed out that similar cases had been described in America under the name of lichen obtusus corneus

MEDICO-PSYCHOLOGICAL ASSOCIATION OF GREAT BRITAIN AND IRELAND

Mental Disabilities for War Service

THE seventy fifth annual meeting of this Association was held at the rooms of the Medical Society, Chandos street, London, W., on July 27th, Lieutenant-Colonel DAVID G THOMSON, the President, being in the chair

Sir GEORGE SAVAGE read a paper entitled, "Mental Disabilities for War Service" He said that though he did not wish in any way to protect shirkers, he wanted to avoid sending into the Army men who were almost certain to break down under training, or when they arrived at the front He had met many doctors who acted on the idea of giving the men a chance. He granted that sometimes a complete change in mode of life might convert a hypochondriac into a useful worker, but in taking a risk one must see on whom the risk fell He saw at one hospital numbers of men who ought never to have been accepted, men who involved much trouble and anxiety, as well as cost to the nation He had been consulted by many former patients and their relatives as to their fitness for military service When men had had at least one attack of insanity hereditary predisposition must influence judgment of the case. It was his practice to oppose the enlistment for active service of any young man with a direct insane inheritance who had had one marked attack of mental disorder within a few years of this date, if such disorder had needed detention Some of these men were quite suitable for home or munition work. In these cases the previous breakdown was usually unknown to the man's employers or associates, who therefore dubbed him a shirker or a coward. He had seen several people who were becoming unstable because they had been made keenly to feel the mistrust of other people, in some it seemed a lesser danger to allow them to enlist on account of the fear, otherwise, of their developing delusions In some the struggle to decide as to what was their duty had led to various forms of functional mental disorder One case formerly seen for adolescent mental weakness, with inability to concentrate in training for a profession, experienced a return of the old symptoms when the question of enlistment arose There had also been a recurrence of symptoms of mental disorder in so-called shock cases and his opinion was that none of these cases should be allowed to return to duty under six months A class of case which he usually allowed to run the risk of enlisting was that in which the young man had shown, earlier in life a great weakness for lying and pilfering, for which no treatment seemed to do good It was possible such men might make good fighters It was interesting to recognise a form of functional epilepsy which might follow shock or injury He had seen men who, as the result of psychic strain or shock lost consciousness for short periods, and though when removed from the strain they recovered, yet they relapsed when sent back to duty He was confirmed in his opposition to the enlistment of inveterate somnambulists His experience had included some peculiar cases of obsession One case was that of a manufacturer who since a railway accident in which he happened to be had never travelled in a train and had a dread of doing so His mother was in an asylum, and the speaker opposed his enlistment A large and important class was the syphilitic including the general paralytic, the ataxic, and some para syphilitic cases Very many cases of early general paralysis had occurred in the Army and the anxious life was well calculated to start the more active symptoms No man with a clear history of nerve degenerative symptoms related to syphilis should be allowed to enter the Army, but in some

of the cases the symptoms were recent, and these after a reasonable treatment might be allowed to enter the service

Dr PERCY SMITH said that he had met with a number of cases similar to those spoken of by Sir George Savage. Patients with whom he had come into contact perhaps years before, had come recently to learn the right course for them to follow In some worry about the war and the new requirements had brought a return of their former symptoms, and in most of them he did not hesitate to say the men ought to be exempted Medical officers of the Army who did not know the history of the man, and might not have had any special knowledge of mental disorder, did not recognise that men who looked physically fit might yet be very unfit for the Army, because they would soon break down under its ritual Certainly no case of epilepsy ought to be allowed to enter the Army Some had got in and had been made much worse He detailed several cases in his own experience One man, aged 45 who had always been neurotic joined the Anti Aircraft Company and was put on to search light duty, with the result that he had acute insomnia, great depression, and a suicidal tendency A young man, aged 23 whose father was insane was given a commission and only a week afterwards he broke down and attempted suicide. Yet he had been refused permission to declare sick His depression was followed by acute delirium. Some cases had suffered severe strain by the feeling that they were not doing their share, yet they were mainly manifestly unfit.

Dr G E SHUTTLEWORTH said that during the course of the war he had seen some men who were originally feeble-minded boys, and were now brought to him with the view of being certified as unfit for military service He did not so certify them straight away on that mere fact because in the South African War some reputedly feeble minded boys made, when they grew up, very good soldiers He was acquainted with the figures for the special schools in London and Birmingham, and in 1915 it was reported that 70 had joined from the London schools and 100 from Birmingham There was something to be said in favour of institutional children, because they had had a good deal of drill and were prompt in carrying out commands, moreover the Army discipline was likely to do much to keep them straight, if they had sufficient nerve force to stand the incidental shocks and strains Careful judgment was required in regard to the anxious patients in better social positions He had had one or two cases of moral imbecility These were interesting, but very difficult to group One boy developed, at puberty, a great leaning to lying and stealing, though he had been very straightly brought up He enlisted, and in Flanders was constantly in trouble. Dr Shuttleworth said that he wrote to the officer giving a history of the boy, and the result was that he was discharged He had had his measure of punishments but there was no benefit.

Dr SEYMOUR TUCKE said it had probably fallen to the lot of most of the members to be called upon to certify as to the fitness or otherwise from the mental point of view of men to join the Army He recently had had much trouble with a family which had an extraordinary history on the mental side and as the member of it who came to him about an exemption certificate had suffered much from insomnia and quite lost himself when he was worried he did not hesitate to certify him as unfit for the Army, though he was able to follow a quiet occupation for his living Those who had a pronounced neurotic history should be treated with suspicion One such man was in the South African War and on his return he developed such a ready speech that he was put on to recruiting During this work he became increasingly excited and was now the subject of subacute mania There was an old history of tubercle, otherwise he was a strong man

The PRESIDENT considered the subject an interesting and difficult one and one on which it was not easy to lay down definite principles Those in charge of war hospitals saw the results of admitting persons to the Army who had suffered mentally or who at least were potential lunatics Yet when asylums had to be vacated in order to make room for war cases there was difficulty in finding room for all the insane patients, and where there was any doubt the patients were set at liberty Some of these joined the Army, and a number had written asking how their old friends in the asylum were now

Reviews and Notices of Books.

The Diseases of Women

By Sir JOHN BLAND-SUTTON F.R.C.S. Eng. LL.D. Surgeon to the Middlesex Hospital, and ARTHUR E. GILES M.D., B.Sc. Lond. F.R.C.S. Edin. Senior Surgeon to the Chelsea Hospital for Women, and Gynaecologist to the Tottenham Hospital. Seventh edition. With 150 illustrations. London: William Heinemann. 1916. Pp. 571. Price 15s. net.

In the seventh edition of this manual the text has been thoroughly revised and the subject matter rearranged. The authors have departed from the anatomical system of classifying diseases and have adopted a pathological system as they point out in dealing with malformations, displacements and infections which are liable to affect several portions or the whole of the pelvic organs, it is evident that the anatomical classification must lead to confusion, whereas the pathological classification enables the student to obtain a much clearer view of the sequence of the lesions involved. The result of this change is to give the book many new features and undoubtedly to increase its value. The general size and form of the book have also been altered for the better. The diagnosis of the various pelvic affections, their treatment, both medicinal and operative and their prognosis, are all considered in separate sections, this saves a good deal of repetition and should prove useful to the student. The statistics given of the results of abdominal operations on the female pelvic organs at the Chelsea Hospital for Women are very interesting, comprising as they do 3483 cases with 71 deaths, or an average mortality of only 2.03 per cent.

The section on ectopic gestation is also most interesting. We notice however that the authors still consider that the blood in a tubal mole lies between the chorion and the amnion rather than in the chorio-decidual space and in their series the frequency of cases of tubal moles to tubal rupture is in the proportion of 1 to 4 a figure which differs very markedly from that given by most authorities. In the section on fibroids often no mention is made of the important work of Briggs and Hendry which seems to show that it is extremely doubtful if there is any causal relationship at all between this condition and severe uterine haemorrhage. The only treatment suggested is hysterectomy and the good results which have followed the intra uterine application of radium are entirely ignored. The description given of the extended abdominal hysterectomy generally known as Wertheim's operation is not full enough and would be of little assistance to anyone practising this operation for the first time. We are told that the operative mortality is very high and that no reliable returns concerning the remote results are at present available. But the authors can hardly be acquainted with the very full and careful results published by Wertheim himself, and we must therefore conclude that they consider these statistics unreliable. We doubt however if this opinion is held by other gynaecologists who have studied these important results. The practice of introducing two fingers into the rectum in performing the operation of perineorrhaphy illustrated in Figs. 135 and 138 is not only quite unnecessary but a most repulsive and undesirable procedure.

We have called attention to some minor blemishes in what is in general a very useful book for the student and practitioner and one possessing marked originality. The illustrations are good and well reproduced.

American Syccerane Practice

By EDWARD F. CALF and HARRISON P. HEDDY. London and New York: McGraw Hill Book Company. Vol. I pp. 7-7, Vol. II pp. 554. Vol. III pp. 851. Price 25s. each.

The authors have divided their subject into three sections, the first being devoted to each as follows: Vol. I. Diseases of the Skin. Vol. II. Diseases of the System. and Vol. III. Diseases of the Organs. As the general title implies the ground covered deals with American practice in this branch of medicine but as a matter of fact the authors include considerable references to the practice of other countries, notably in France and Germany. The book possesses

therefore, a more than local value, and it presents a very authoritative statement on the technique of sewage. The broad generalities of the problem are well brought out and the volumes make a comprehensive contribution to our knowledge. Apart from a historical introduction, Vols. I. and II. are concerned in a full description of the engineering aspects of the question. The first chapter in Vol. I is very interesting reading, and amounts to a historic account of the growth of sewerage schemes in which the authors draw attention to the lessons taught by early sewerage works. In this reference they give an account of the development of the water carriage system at present in use in the metropolis engineered by Sir Joseph Bazalgette in 1855 soon after the cholera epidemics. Paris also it is interesting to recall inaugurated a sewerage system after a severe cholera epidemic in 1832. Many advances have since been made in the ultimate treatment and disposal of sewage and this is the subject of Vol. III. Here we find the chemical and biological methods of purification adequately described, and we know of no more thorough survey of the subject in the light of recent developments. These three volumes will be a very valuable source of reference to engineers, chemists, and all students anxious to be familiar with the world's methods of engineering treating, and purifying sewage.

LIBRARY TABLE

The Essentials of Histology (Descriptive and Practical) for the Use of Students. By Sir EDWARD A. SCHÄFER, M.D., Sc.D., LL.D. F.R.S., Professor of Physiology in the University of Edinburgh. Tenth edition. London: Longmans, Green, and Co. 1916. Pp. 563. Price 10s. 6d. net.—The tenth has followed the ninth edition of this useful manual within little more than two years in spite of the increasing dearth of medical students. The text has been revised without any notable alterations and many illustrations have been added, the majority being photographs of microscopic preparations. The endocrine glands as we should expect from the author, have been specially generously treated. We repeat again here the complaint that not all the sections have a note of the scale of magnification. The addition of this to each illustration and of the method of staining adopted would materially add to the value of the book without increasing its size. The present-day student is fortunate to possess such a manual as this, complete in essentials and attractive in form.

Measures for Abundance and Extermination of Flies, Mosquitoes, Lice and other Vermin. By H. MAXWELL-LEFROY M.A. F.Z.S. Professor of Entomology Imperial College of Science and Technology, late Imperial Entomologist to the Government of India. Calcutta and Simla: Thacker Spink, and Co., London: W. Thacker and Co. 1916. Pp. 17. Price 1s. net.—A second edition of Professor Lefroy's useful pamphlet is welcome. It contains simple instructions for avoiding the attack of disease carrying insects and for their extermination. The pamphlet was written in response to inquiries from doctors, nurses and others as to how to protect themselves and those under their charge. The first edition was circulated privately last summer and enjoyed great popularity. The present edition has been brought up to date with the help of the entomologists who have been working at the front and of investigations carried on during the winter at the Imperial College. Matter specially applicable to India has been added. The simple directions and modest price bring the pamphlet within the reach of all.

The Maintenance of Health in the Tropics. By W. J. SIMPSON, C.M.G. M.D. Aberd. F.R.C.P. Lond. Professor of Hygiene and Public Health in the University of London. Second edition. London: John Bale Sons and Danielsson. Limited. 1916. Pp. 174. Price 3s. 6d. net.—This little handbook on the maintenance of health in the tropics was written more than ten years ago at the request of the Committee of the London School of Tropical Medicine and describes in a simple and popular manner the measures of personal hygiene. Simpson has gained his object in the tropics. That Professor Simpson's second edition is evidenced by the call for a new chapter on states revised by Colonel Alcock. No one should live in hot countries without taking to heart the lessons included in this little book.

New Inventions.

AN IMPROVED BED-REST

THIS improved form of bed rest, combined with table and book rest, which has already proved a great boon to wounded soldiers, has been brought to our notice by Mr H W Husbands, M R C S Eng, L R O P Lond. As will be seen from the illustration, the apparatus is of the folding type, and is very light to handle, weighing 8 or 9 lb. The book rest *E* can be folded up and locked down on catch *d* when a table

only is required, and a detached wooden table can be substituted for the canvas roller table if necessary. The whole of the table and book rest part of the apparatus can be folded out of the way when a bed rest only is required. The advantages claimed for this bed rest are: Firstly, there is no objectionable bottom crossbar at the lower end of the back, the only crossbar *F* being kept well behind, the patient being supported by the canvas back and cross webbing. Secondly, the extension of the canvas back *J* under the patient makes a comfortable support for his back, should the patient be unable to raise himself to enable this extension piece to be passed under him, it can be turned back and buttoned securely out of the way. Thirdly the canvas of the back and of the table can be easily removed for washing.

The apparatus can be obtained from Mr R Brooks King, Widcombe Taunton the price for the bed rest alone being 9s., bed rest and table, 13s. 6d., and bed rest, table, and book rest, 15s. 6d.

A NEW APPARATUS FOR THE INTRATRACHEAL INSUFFLATION OF ETHER

It has been frequently urged that the outfit required for this valuable method of anaesthesia is too cumbersome and unnecessarily expensive, and it has long been my feeling that both these objections ought to be overcome. The apparatus described here is a further attempt (*vide THE LANCET*, July 11th, 1914) to meet this criticism, the design was roughly sketched and placed before Messrs Mayer and Meltzer in 1914 but for various reasons execution was deferred until last year and the finished model was shown before the

Section of Anaesthetics of the Royal Society of Medicine on April 14th last. The idea underlying the apparatus is that ether drips from a container (B) into a central chamber through which passes the air current (A) from the motor or foot bellows, and is there vapourised partly by this means and partly by the heat imparted by an encircling hot-water jacket. The tap *C* regulates the flow of ether, which can be delivered in drops or in a continuous stream. The tube *C* connecting the ether container and the vapourising chamber equalises the pressure on the upper and lower surfaces of the ether, and regular dropping is ensured. During anaesthesia the tap of the equalising tube must be kept open but if the container needs refilling during an administration this tap must be first closed before the bung of filling funnel (P) is removed, and kept closed until *P* has been replaced. At the end of anaesthesia the container can be emptied by means of a tap (not shown). *K* is the safety valve, *I* the manometer, and *L* the tap on the exit tube for reducing pressure. The hot-water jacket is filled at *N*, and emptied by opening *O*. The thermometer, *H*, should register 110° to 120° F., according to the temperature of the room and the nature of the operation. A *Y* piece provided with a tap is fixed in the tubing from the motor for attachment to an oxygen cylinder.

The hot-water jacket stands in a non conducting cover. The apparatus is simple and compact, it weighs 5½ lb and measures 8½ × 4½ × 12 inches. The arrangement of the motor and foot bellows is practically the same as that previously described (*vide supra*).

Messrs Mayer and Meltzer, Great Portland street, W. have made the apparatus with their usual care and skill.

SPHAGNUM MOSS DRESSINGS IN IRELAND—A Dublin correspondent writes:—When the Irish War Hospitals Supply Depot started its work in November, 1915, at 40, Merrion square Dublin, the entire control of sphagnum moss was handed over to the Royal College of Science Detachment of the St John Ambulance Brigade, which has since organised 25 sub-depôts throughout Ireland with the help of advice from Colonel Cathcart. Some difficulty was at first experienced in getting the proper moss, but after sending correct samples to collectors an excellent supply was obtained, the quality of that coming from Galway, Mayo, and the King's County being particularly good. A committee of the Royal College of Science Women's Division manages the depot, for which excellent work rooms have been granted by the Department of Agriculture. During the last seven months sphagnum dressings have been turned out as follows: Simple dressings, 58,957, dysentery pads, 325, elbow and garden cushions, 1435, the latter being made from the inferior samples of moss. Eighty different hospitals have been supplied in England, Ireland, France, Belgium, Egypt, and Greece and the requests for dressings are now so numerous that it has been found

difficult to keep up with the demand. A special effort made during the past six weeks has resulted in an output of over 20,000 dressings in June and over 16,000 for the first half of July. The War Office has requisitioned 5000 sublimated dressings each month, and this branch of the work is carried out at the premises of Messrs Fannin in Grafton street. The history of sphagnum moss as a dressing goes back to considerable antiquity. The following incident is recorded in Joyce's 'Child's History of Ireland'. In the year 1014, when marching home after the battle of Clontarf, the Dalcassians were attacked by an old enemy, M'Gilla Patrick, a prince of Ossory. Their chief gave orders to place the wounded in safety in the rear, but they insisted on taking part in the fight. Let stakes from the neighbouring wood be fixed in the ground, said they, and let us be tied to them for support with swords in our hands having our wounds bound up with moss and let two unrounded men stand by each of us on the right and on the left. Thus will we fight, and our companions will fight better for seeing us. It was done so and when the Ossorians saw this they were struck with fear and pity, and refused point blank to fight with such resolute and desperate men.

A CASE OF ARTHRITIS DEFORMANS TWO YEARS AFTER TREATMENT WITH RHEUMATISM PHYCACOGEN

Mr. D, 43 years. Duration of disease, 15 years. There is no family history of rheumatism.

The disease began with a tender swelling in one heel, intensely painful and with much redness, shortly after the birth of her second and last child. At intervals of from two to three weeks similar attacks occurred in her shoulders, wrists, knees, and other joints. In about a year the attacks became more frequent but the pain was able to be relieved by medicine given her by her doctor, but all medication failed to stop the progressive nature of her complaint. The joints began to become permanently swollen and stiff till she could only get up and move about with great difficulty.

During the summer months there was always some alleviation but March was her worst time, the pain coming on worse in the evening like very bad toothache lasting through the night and becoming bearable in the morning allowing her to attend to some household duties. This went on for several years during which time besides medication she tried vapour baths and brine baths at Droitwich without any effect. She was also in the Cambridge Hospital for Special Diseases for some three weeks without any permanent benefit. About four years ago the patient got very much worse till nearly every joint in her body was affected, and she was never free from pain, with very bad sleepless nights.

Two years ago when treatment with Phylacogen was commenced, the picture was that of an advanced and very bad case of arthritis deformans. The patient suffered continually agonising pain, which distorted her features when she moved, could not bear the weight of her bed-clothes at night, could with difficulty and great pain just manage to shuffle a few inches at a time across the floor even the thickness of the oil-cloth covering being an obstacle requiring the greatest care to negotiate. It took her quite three minutes to rise from or get down to a chair, she could not raise her hands above the level of her chest had to be carried up and down stairs had not been out of doors except in a bath-chair for over two years could do nothing to dressing or feeding herself was very low spirited with no brighter outlook in life than the day when she should be confined to bed a helpless cripple.

On examination nearly every joint in her body was involved even to her lower jaw and neck. Deformity and swelling were very marked. Shoulder, elbow, hip-joints were very stiff, but not so deformed as the other extremity joints. The right wrist was completely ankylosed and left nearly so. Subluxation of the proximal phalanges of the right hand was complete and the left nearly so. The fingers being pushed over so much to the ulnar side that the little finger was almost at a right angle to its normal direction. All the joints were very much swollen and tender. The knees were so much deformed that one could hardly be got past the other. The toes were as bad as the fingers. Muscular wasting was very pronounced.

Treatment began the beginning of February 1914 with 10 c.c. of Phylacogen injected subcutaneously into the arm and repeated in 48 hours. 20 c.c. 48 hours after the first injection. In 48 hours and so on an increase of 10 c.c. a repetition of the former quantity till 10 c.c.

were being given, 6 or 7 doses of 10 c.c. were given. There was considerable reaction to the injections at first each increase being followed by reaction, but not generally when a repeat dose was given. Shiverings and headache were the main symptoms, with a rapid pulse and sometimes small rises in temperature, the patient having to go to bed. These all passed off by the afternoon of the following day, when the patient usually felt some improvement over her previous condition. Considerable local swellings round the seat of injection occasionally occurred, but these were generally gone in 24 hours.

The first effects of the injections were the diminution of pain and the absorption of the softer elements of the swellings in and about the joints. Sleep very soon became normal, and from a nervous wreck the patient became her former high spirited self. In about three weeks she walked to the top of her street a considerable climb, and the following Sunday walked to church about 500 yards. Strength came back progressively till she could grasp firmly and without pain. Spells of damp weather and East winds bringing back pain and swelling in some of her joints. She had some more injections during the first 12 months and a second course in January and February, 1915 somewhat like the first course, but reaching the maximum dose, 10 c.c., more quickly. During May and October she had more doses of 5 to 10 c.c. weekly, more as a prevention than really required by any set-back.

In all the patient has had about 500 c.c.

All pain and swelling has gone except in so far as the ends of the bones themselves are enlarged, but there are indications that these swellings are in course of modification and getting smaller. This is specially noticeable in the metacarpo-phalangeal joint of the left little finger. Before treatment the relative position of the ends of the bones could not be made out owing to the great swelling of the peri-articular tissues. This swelling has quite gone and the proximal end of the phalange is on the ulnar side of the metacarpal bone, quite half an inch from the end, the ends of the bones are not increased and seem denuded of cartilage.

For many years the patient had not been able to take off her wedding ring owing to the enlarged finger joint but within a few weeks after the commencement of treatment the ring came off without difficulty.

The gradual onset one joint becoming acutely inflamed, and then a period of quiescence, followed by an attack in a different joint each succeeding attack being more severe and accompanied by rise in temperature and general disturbance, seems to point to a blood infection by some organism which had a selective preference for the joints, gradually weakening their resistive power till a general disease of the joints was set up.

Another point of interest in this case was the constant and fairly severe reaction which followed each increase in the dose.

The patient is now in excellent health and spirits, and within the past month she made the journey alone to Yorkshire whither she went for a holiday (June 30, 1916).

Other reports showing the value of Rheumatism Phylacogen in rheumatic conditions will be found in our booklet, Phylacogen Therapy a copy of which we shall be glad to send to any medical man on request.

THE NESTA

PATENT HYGIENIC SPRING MATTRESS

IS THE **ONLY** MATTRESS

THAT HOLDS

THE CERTIFICATE OF THE INSTITUTE OF HYGIENE.

THE "NESTA" IS AN OVERLAY MATTRESS

and is constructed in the latest and most approved principle, the internal filling is composed of specially tempered steel wire springs, before the springs are manufactured the wire is covered, by our own machinery, with a white cotton moisture-proof braid which renders the springs not only noiseless in action but at the same time rustproof—a sure preventive against the discomfort of broken springs. Each spring is secured to its neighbour, thus forming an entire surface of springs. The means of securing the springs is so ingenious that, whilst not one of the numerous springs can ever lose its original position, it is impossible for any one spring to interfere with the action of its neighbour, but, on the contrary, each spring assists those near it, thus preventing any undue strain on any one or batch of springs. By varying the gauge of wire used, the "Nesta" Mattress can be made to any required resiliency—from the luxurious softness of a down bed to the firmness of a good hair mattress. The internal spring filling is covered with calico, which is then upholstered in wool or hair according to the quality. The "Nesta" Pillow, made on the same principle, will never lose its shape, and is a revelation of comfort to those who have only used the ordinary feather pillow.

Provision for the War Cripple

IN spite of the marvellous development of modern artillery and small arms for their work of destruction, the vast majority of wounds which they inflict are such as to enable the bearer to return to his military duties within a longer or shorter time. In an address delivered at the Surgical Section of the Royal Society of Medicine, which we summarise in another column, Major TAIT MCKENZIE, R A M C, describes the various degrees of disability and what is the plan adopted for each, with particular reference to the class of cases in which special, and in many instances prolonged, treatment is required. In order to unload the military hospitals and to group these men where the personnel and paraphernalia for special treatment are conveniently accessible, Command Depôts have now been established up and down the country, each containing 2000 or 4000 beds. Nine depôts are at present in existence—at Seaford, Shoreham, Tipperary, Ballyvonare (Buttevant), Randalstown, Ripon North, Sutton Coldfield, Kinnel Park (Rhyl), and Heaton Park (Manchester). Major MCKENZIE gives an outline of the methods employed at one of these for relieving the stiffness of muscles and of joints, after the actual injury which caused them has healed and in general for restoring to convalescence by appropriate means any physical disability, whether due to wounds or to the diseases incidental to service. As the methods have evolved and systematised, and as experience in selection of cases has grown, results are being obtained in this country comparable to those which have been claimed for similar methods in France,¹ and a larger proportion of wounded men have returned to the front or have been retained for some less arduous form of military service.

Unfortunately, when everything possible has been done for them, there remains a certain number of luckless ones whose disability is such as to incapacitate them from further service. From our Navy and Army, numbering millions, employed in every form of service in many parts of the world, a large quota of discharges on account of permanent disablement might well be expected. It is therefore with a sense of relief that we note the actual figures quoted in a circular (No. 9) sent down by the War Pensions Statutory Committee to the Local Committees. From the beginning of the war up to May 31st, 1916, a period approaching

two years, the total number of disabled sailors and soldiers discharged from all causes was 33,919. Of these, 1381 were eyesight cases, 2224 wounds of arm or leg necessitating amputation, 12,529 wounds or injuries of limbs in which the limb could be retained, 2446 wounds and injuries to the head, 2122 other wounds and injuries, leaving 13,017 invalided on account of chest complaints, heart disease, rheumatism, and other disabilities in smaller number. Similar figures are available for a year ago, and a comparison of the two returns allows a rough calculation of the monthly incidence of disability, amounting to 90 eyesight cases, 150 amputations, and 950 injuries to limbs not requiring removal. Representing, as this monthly figure must do, an appalling amount of individual suffering, whether directly as a result of wounds and disease, or from its remoter effects on a man's prospects and outlook upon life, the figure is, at all events, now known, and the problem of dealing with it one which can be squarely faced.

The task of making provision for the care of disabled officers and men after they have left the service is one of the most important functions devolving on the Local Committees of the War Pensions Statutory Committee. For those who are completely and permanently disabled for any kind of useful employment, nothing remains but the allotment of a pension sufficient to maintain a comfortable life free from anxiety. For this purpose six million pounds have been allotted by the Exchequer in the expectation that supplementary funds will be at the disposal of Local Committees. The number of men who have so far been awarded a permanent pension on the full totally disabled rate is very small. The Central Committee is alive to the undesirability of condemning men to a life of idleness if this can possibly be avoided, and the Local Committees have been asked to see in every case how far the disabled man may be encouraged to take light employment, and in the case of the partially disabled to be educated for taking his full share again in the industry of the country. For some the prospect is open of training leading to employment on an agricultural colony, but the Central Committee has laid down that, so far as practicable, disabled men should be encouraged to return to their own homes and to take their place in the ordinary industrial community under normal conditions of employment. The Board of Trade is giving consideration to the best method of guidance as to the rate of wages to be paid by the employer in any particular case. The success of the whole scheme will rest with the action of the Local Committees. Some of these are already formed and in active work, others have not yet buckled to their task. On them devolves the personal and friendly contact with the disabled man which will enable the nation's debt to him to be discharged with individual thoughtfulness and care. Nothing can completely compensate the war cripple for his disability, but it is in the power of the War Pensions Local Committees to see that his life is made as happy and as useful as his disability permits.

"NESTA," LTD. (Dept 32), 60, Silver St., Edmonton, London, N.

resided over by Mr. E. B. Turner, some very important subjects were discussed. Chief among these was the position occupied by the general practitioner with reference to the State treatment of venereal diseases. Following the advice in the final report of the Royal Commission on Venereal Diseases, the State, through the Local Government Board, now proposes to organise arrangements for adequate laboratory facilities and skilled free treatment, the measures being entrusted to councils of counties and to county boroughs, while 75 per cent of the cost of carrying out the schemes are to be met out of the Imperial Exchequer. Immediate adequate facilities for the diagnosis and treatment of venereal diseases—syphilis, gonorrhoea, and soft chancre being so defined—are to be furnished when and where they are absent or deficient. This means the establishment of clinics at hospitals, the gratuitous supply of salvarsan or its substitutes, and laboratory facilities for aid in diagnosis. The circular letter from Mr. Long, President of the Local Government Board, asking for the help of public bodies concerned, pointed out that such clinics should be available for the treatment of all comers without distinction as to means or place of residence, adding, very properly though with some discrepancy that the treatment should be given as far as practicable in co-operation with the patient's own doctor. The position is an anxious one for the general practitioner and a serious one for the public, who will certainly not desire to see the personal medical adviser superseded by officials. On the motion of Dr. Macdonald, it was decided unanimously by the Representative Meeting that a deputation should go to the President of the Local Government Board to explain the issues involved. It is intended to secure a pledge that an Order will be issued by the Board to every local authority concerned, requiring it to have effective consultation with a representative of the local medical profession at the earliest stage of the scheme, and through all its stages.

The energies of the Association have been devoted in a great measure since the breaking out of the war to the securing of a good supply of officers for the Royal Army Medical Corps. The Central Medical War Committee has accepted with gratitude the great organising assistance of the Association, and with the aid of the public departments concerned—namely, the Local Government Board, the Board of Education, and especially the National Health Commission—it has been possible for the Committee to consider both the medical needs of the general public and the individual positions of those accepting commissions. It is well known to our readers that recently the War Office has felt compelled to modify the terms under which temporary commissions in the Royal Army Medical Corps were given, and the departure from the definite agreement that these commissions entailed one year only of service was naturally made the subject of debate at the Representative Meeting. A message from Sir Alfred Keogh, the Director General of the Army Medical Service, was delivered to the meeting by Sir Robert Morant, defining and explaining the changes which had taken place. Sir Alfred Keogh's communication will be found on p. 253 of this issue of THE LANCET. It emerged from the discussion of the activities of the Central Medical War Committee that the British Medical Association up to the end of 1915 had spent no less than £900 on the work of the Committee, while a motion to ask the Government for reimbursement was patriotically rejected.

THE EARLY DIAGNOSIS OF PULMONARY TUBERCLE

THE difficulties attending the early diagnosis of pulmonary tubercle in certain cases are well recognised, but since the welfare of the patient depends on a prompt recognition of his condition the difficulties have much exercised the mind of the profession, as various important clinical and laboratory methods bear witness. A new method has been worked out by Professor Carlo Martelli, of the University of Naples, and is described in the issue of *Il Policlinico* of July 9th (Practical Section). Briefly, the technique consists of the following steps: (1) To promote bronchial secretion and expectoration by means of iodides, one half to one gramme daily, given with decoction of senega and syrup of ipecacuanha for two or three days, (2) to collect the sputum, 100–200 or more c.c., and homogenise it with an equal quantity of antiformin for two to four hours in a thermostat, (3) thoroughly to centrifugalise the material in conjunction with repeated washings with physiological salt solution, (4) to make smears of all the residue, staining the preparation with Ziehl's carbol fuchsin in the ordinary way and another after Much's method for granules. Professor Martelli claims that this technique will reveal the presence of scanty bacilli and collections of Much granules in cases where neither clinical nor ordinary bacteriological methods are sufficient to form a diagnosis. We question whether it is ever necessary to resort to the induction of an iodide bronchial catarrh which may indeed in certain cases reveal bacilli, but only at the expense of turning a "closed" case into an "open" one. If there is close co-operation between the clinician and the laboratory expert, ensuring the obtaining of the most suitable specimens of sputum for examination, we believe that the tubercle bacilli, when present, will rarely fail to be found by ordinary means. Experience shows that bacilli are rarely revealed by the antiformin method when not discovered in direct films.

TETANUS DUE TO THE USE OF CATGUT

ONE of our correspondents in Scotland described in THE LANCET of July 1st (p. 33) the establishment of a factory in Edinburgh for the manufacture of surgical catgut, a product for which we depended on Germany before the war. He stated that the manufacturer had found it impossible to produce from catgut, obtained under septic conditions, a sterile ligature by means of a subsequent medication after the strings had been twisted and dried without impairing the tensile strength. The difficulty of sterilisation is illustrated by an unfortunate case reported to the Académie de Médecine of Paris on June 20th by M. Charles Nicolle and M. Henri Bouquet. A woman, aged 47 years, was admitted to the French Civil Hospital, Tunis, with a large umbilical hernia, partly reducible. Morestin's operation for radical cure was performed, a transverse incision being made above and below the umbilicus, when a large flap of skin and fat was removed. When the sac was opened the omentum was found adherent and was resected after ligature with catgut. The intestine was not seen. The sac was resected and closed. The aponeuroses were united by three catgut sutures. The wound in the skin was closed by metallic sutures and Michel's clasps. A small drain was inserted at each end. The drains were removed on the third day and the patient did well until the sixth day, when, although the wound

The Regulations with Respect to the Sale of Cocaine

MINISTERIAL statements in the House of Commons had prepared the way for the announcement of some forms of restriction on the distribution of cocaine, but few people expected that the regulations would be so drastic as those which were gazetted last week, coming into force forthwith. And yet the new conditions are by no means unnecessarily strict, for there is no occasion—or we know of none—requiring the use of cocaine except under the supervision of properly qualified persons. Legislation such as that, which has been enacted does not accord with preconceived views in this country with respect to provision for the use of poisons, and it is doubtful whether in peace time it would have been possible to secure the adoption of such a course as that indicated by the Order in Council, but the evils in the midst of which we live are constantly being relieved by vigorous movements towards reform. Not only is it made an offence to import cocaine except under licence, but it is now illegal for any unauthorised person to have cocaine in his possession, or for a pharmaceutical chemist to supply cocaine except on the written order of a medical practitioner. Thus by one stroke of the pen, as it were, the trivialities of the Pharmacy Acts are replaced by effective prevention of the abuse of a mischievous drug. And the Pharmaceutical Society—the body that administers the Pharmacy Acts—has been well advised in adopting the policy of coöperating with the Government in the endeavour to put a stop to a baneful traffic. It would not have been wise either in behalf of the Society or of pharmacists in general, to plead, in the one case, a vested interest in the administration of the Pharmacy Acts and, in the other, a vested interest in the sale of cocaine. The central pharmaceutical authority has placed the welfare of the State before its own, and deserves the hearty commendation of the public.

The new regulations, severe as they may appear to the ordinary observer, are less stringent than those after which they are fashioned—namely, the regulations framed under the Harrison law of the United States. In America, as has been explained in THE LANCET recently, it is not sufficient for the prescriber of cocaine to be a registered medical practitioner or for the dispenser to be a qualified pharmacist—both prescriber and dispenser must also be registered under an "anti narcotic law." But the principle and the object of the American legislation are the same as our own, the principle in each case being the restriction of the distribution of cocaine to well defined channels, and the object the prevention of the cocaine habit. In future the cocaine habitue will be dependent for his supplies of the drug on clandestine sources, and as it is no doubt correct to assume that special efforts will be made to prevent smuggling, we may take it that the cocaine habitue will soon be almost an extinct type in this country. The new regulations affect medical practice only as regards the writing of the prescription. A medical man who writes a prescription of which cocaine is one of the

items must (1) sign it with his full name and address and qualifications, (2) write the date on it, (3) mark it with the words, "Not to be repeated", and (4) specify the total amount of cocaine to be supplied. These requirements entail departures from the practice usually observed by prescribers, but it is important that they should do exactly as the new law requires. Strangely enough, it is not necessary in prescribing a proprietary medicine containing cocaine to state the total amount of cocaine to be supplied, it is sufficient to state the quantity of the proprietary medicine. It is not quite clear why this distinction is made. Preparations containing less than one part of cocaine in a thousand do not come under the regulations.

The pharmaceutical chemist is affected by the new conditions to the extent that he may only supply cocaine on, and in accordance with, a written prescription of a medical practitioner, which prescription he may only dispense once, except in pursuance of fresh directions duly endorsed on the prescription by the medical practitioner by whom it was originally issued. Registered dentists and registered veterinary surgeons are not prohibited from using cocaine in their practices, but this exemption does not extend to non registered dental practitioners, and it is to be hoped that the Government will continue in their refusal to alter the regulations for the benefit of such unqualified persons. Anyone may be an unqualified dentist, and if we allow an unqualified dentist the right to have cocaine in his possession theoretically we allow the same privilege to everybody. The regulations as to the importation of cocaine without licence, and as to the possession of cocaine, also apply to "raw opium, powdered or granulated opium, or opium prepared for smoking" and any solid or semi solid mixture containing opium.

Annotations.

"No quid nimis"

THE ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION

THE eighty fourth annual meeting of the British Medical Association was held in London last week, Dr J A Macdonald, chairman of the Council presiding, in the unavoidable absence of Sir Alexander Ogston. The scientific and social side was very properly dropped on account of the war. At the General Meeting Sir Clifford Allbutt was elected President of the Association for the ensuing year in succession to Sir Alexander Ogston. The gathering was reminded by one of the members that they were assembled on the eve of the fiftieth anniversary of the death of Sir Charles Hastings, the founder of the Association, and a motion was carried unanimously recording "the unabated veneration of the British Medical Association for its ever honoured founder." The Representative Meeting had already recorded its deep regret at the untimely and patriotic death of Sir Victor Horsley, the first chairman of Representative Meetings after the reconstitution of the Association. While the business of the General Meeting was purely formal, at the Representative Meeting

presided over by Mr. E. B. Turner, some very important subjects were discussed. Chief among these was the position occupied by the general practitioner with reference to the State treatment of venereal diseases. Following the advice in the final report of the Royal Commission on Venereal Diseases, the State, through the Local Government Board, now proposes to organise arrangements for adequate laboratory facilities and skilled free treatment, the measures being entrusted to councils of counties and to county boroughs, while 75 per cent of the cost of carrying out the schemes are to be met out of the Imperial Exchequer. Immediate adequate facilities for the diagnosis and treatment of venereal diseases—syphilis, gonorrhoea, and soft chancre being so defined—are to be furnished when and where they are absent or deficient. This means the establishment of clinics at hospitals, the gratuitous supply of salvarsan or its substitutes, and laboratory facilities for aid in diagnosis. The circular letter from Mr. Long, President of the Local Government Board, asking for the help of public bodies concerned, pointed out that such clinics should be available for the treatment of all comers without distinction as to means or place of residence, adding, very properly though with some discrepancy, that the treatment should be given as far as practicable in co-operation with the patient's own doctor. The position is an anxious one for the general practitioner and a serious one for the public, who will certainly not desire to see the personal medical adviser superseded by officials. On the motion of Dr. Macdonald, it was decided unanimously by the Representative Meeting that a deputation should go to the President of the Local Government Board to explain the issues involved. It is intended to secure a pledge that an Order will be issued by the Board to every local authority concerned, requiring it to have effective consultation with a representative of the local medical profession at the earliest stage of the scheme, and through all its stages.

The energies of the Association have been devoted in a great measure since the breaking out of the war to the securing of a good supply of officers for the Royal Army Medical Corps. The Central Medical War Committee has accepted with gratitude the great organising assistance of the Association, and with the aid of the public departments concerned—namely, the Local Government Board, the Board of Education, and especially the National Health Commission—it has been possible for the Committee to consider both the medical needs of the general public and the individual positions of those accepting commissions. It is well known to our readers that recently the War Office has felt compelled to modify the terms under which temporary commissions in the Royal Army Medical Corps were given, and the departure from the definite agreement that these commissions entailed one year only of service was naturally made the subject of debate at the Representative Meeting. A message from Sir Alfred Keogh, the Director General of the Army Medical Service, was delivered to the meeting by Sir Robert Morant, defining and explaining the changes which had taken place. Sir Alfred Keogh's communication will be found on p. 253 of this issue of THE LANCET. It emerged from the discussion of the activities of the Central Medical War Committee that the British Medical Association up to the end of 1915 had spent no less than £900 on the work of the Committee, while a motion to ask the Government for reimbursement was patriotically rejected.

THE EARLY DIAGNOSIS OF PULMONARY TUBERCLE

THE difficulties attending the early diagnosis of pulmonary tubercle in certain cases are well recognised, but since the welfare of the patient depends on a prompt recognition of his condition the difficulties have much exercised the mind of the profession, as various important clinical and laboratory methods bear witness. A new method has been worked out by Professor Carlo Martelli, of the University of Naples, and is described in the issue of *Il Policlinico* of July 9th (Practical Section). Briefly, the technique consists of the following steps: (1) To promote bronchial secretion and expectoration by means of iodides, one half to one gramme daily, given with decoction of senega and syrup of ipecacuanha for two or three days, (2) to collect the sputum, 100-200 or more c.c., and homogenise it with an equal quantity of antiformin for two to four hours in a thermostat, (3) thoroughly to centrifugalise the material in conjunction with repeated washings with physiological salt solution, (4) to make smears of all the residue staining the preparation with Ziehl's carbol fuchsin in the ordinary way and another after Much's method for granules. Professor Martelli claims that this technique will reveal the presence of scanty bacilli and collections of Much granules in cases where neither clinical nor ordinary bacteriological methods are sufficient to form a diagnosis. We question whether it is ever necessary to resort to the induction of an iodide bronchial catarrh which may indeed in certain cases reveal bacilli but only at the expense of turning a "closed" case into an "open" one. If there is close co-operation between the clinician and the laboratory expert, ensuring the obtaining of the most suitable specimens of sputum for examination, we believe that the tubercle bacilli, when present, will rarely fail to be found by ordinary means. Experience shows that bacilli are rarely revealed by the antiformin method when not discovered in direct films.

TETANUS DUE TO THE USE OF CATGUT

ONE of our correspondents in Scotland described in THE LANCET of July 1st (p. 33) the establishment of a factory in Edinburgh for the manufacture of surgical catgut, a product for which we depended on Germany before the war. He stated that the manufacturer had found it impossible to produce from catgut, obtained under septic conditions, a sterile ligature by means of a subsequent medication after the strings had been twisted and dried without impairing the tensile strength. The difficulty of sterilisation is illustrated by an unfortunate case reported to the Académie de Médecine of Paris on June 20th by M. Charles Nicolle and M. Henri Bouquet. A woman, aged 47 years, was admitted to the French Civil Hospital, Tunis, with a large umbilical hernia, partly reducible. Morestin's operation for radical cure was performed, a transverse incision being made above and below the umbilicus, when a large flap of skin and fat was removed. When the sac was opened the omentum was found adherent and was resected after ligature with catgut. The intestine was not seen. The sac was resected and closed. The aponeuroses were united by three catgut sutures. The wound in the skin was closed by metallic sutures and Michel's clasps. A small drain was inserted at each end. The drains were removed on the third day and the patient did well until the sixth day, when, although the wound

looked well, the temperature rose to 101.1° F. On the seventh day she refused food because of "pain in the throat, and wry neck." On the eighth day there were trismus and attacks of opisthotonos. The wound still looked well, but there was a slight purulent discharge from the point of drainage on the left side. Death took place on the ninth day in spite of serum treatment instituted two and a half days after the appearance of symptoms of tetanus. After death the wound was opened. In the position of the aponeurotic suture the tissues were greyish and there was a little pus. Two catgut sutures were removed, and after wiping with gauze were sent in sterile tubes to the Pasteur Institute. There the catgut was washed in normal saline solution and desiccated at a temperature of 98.6° F for eight hours. It was then broken up in a little bouillon and inoculated with some drops of the latter in the muscles of the thigh of two guinea pigs and two mice. After an incubation period of 48 to 72 hours tetanus appeared in all the animals. It rapidly became generalised in the mice, who succumbed on the fifth day, but it remained local in the guinea pigs. There was therefore no doubt that the patient's death was due to the presence of tetanus spores in the catgut. This had been obtained from an important French house in sealed tubes, and the anhydrous vapours of acetone had been used to sterilise it. It is noteworthy that at a recent meeting of the Académie de Médecine a well known surgeon, M. Quénu, declared that he had never experienced any serious accidents due to the use of catgut.

EXOPHTHALMOS IN LEUKÆMIA

Dr C. Schiøtz describes (*Trækskr f d Norske Lægeforening*, Christiania, 1916, xxvi., 545, 601) the case of a cellulose worker, aged 22, who had an attack of "influenza" at the beginning of 1915 and remained unwell thereafter. During May and June he was ill in bed, with headache, chilliness, dizziness, and increasing exhaustion, while his sight became very bad for a time. Early in August his eyes began to protrude from their orbits, and diplopia and epiphora were noted. He went into hospital and was found to have an enlarged liver, though the spleen could not be felt and the lymphatic glands were but little enlarged. The blood count showed 1,600,000 red cells per c mm and 84,000 white cells, of which three quarters were large lymphocytes 13 to 17 μ in diameter, 16 per cent were small lymphocytes, 8 per cent neutrophils, the red cells varied considerably in size and shape. Both eyes protruded, particularly the right, and showed limited movements. Both conjunctivæ were chemotic, on the right side so much so that the eye could not be closed. The optic discs looked cloudy and were swollen two diopters high; there were hæmorrhages round the right disc. Examination of the patient's thorax with the Roentgen rays showed a general enlargement of the bronchial lymphatic glands on the right side. The patient was given arsenic, and at the same time was treated with the Roentgen rays, the orbits, hepatic region, and splenic region each receiving four exposures. So far as the eyes were concerned, the result was excellent, the exophthalmos and chemosis entirely disappeared within a fortnight. The patient continued to have headache at times, however, and the blood count exhibited little or no improvement, the percentage of hæmoglobin, measured by Sahli's method, falling in five weeks from 45 to 25. Dr Schiøtz notes that the temperature chart from time to time was just

like that of tertian malaria, attacks of fever up to 102.4° F recurring at intervals of 48 hours for several days together. Discussing the etiology of exophthalmos in leukæmia, he says that it is commonly attributed to the presence of lymphomas within the orbits. Dissatisfied with this explanation, he develops at some length the view that it may be a toxic phenomenon, and may result from the action of a toxin produced by the unknown infecting agent that causes leukæmia. He quotes the case of a farmer, aged 48, whom he saw in 1914, who developed slight exophthalmos apparently as the result of smoking too much tobacco (15 to 20 pipes a day), and notes that nicotine poisoning can produce widening of the palpebral fissure and protrusion of the eyeball in experimental animals. Other drugs capable of causing exophthalmos are adrenalin, paraphenylene diamine, salvarsan, tetrahydronaphthylamine, and dionin. Among the diseases in which exophthalmos may sometimes occur are Ibrahim's primary chronic arthritis of children, lead poisoning, malaria, pellagra, and leukæmia. Dr Schiøtz points out that all the drugs he mentions are amino bodies, and he argues that probably something is amiss with the metabolism in the diseases in which exophthalmos sometimes occurs, with the result that toxic amino bodies, perhaps connected with the purins, find their way into the circulation and cause protrusion of the eyeballs. He thinks it doubtful whether this protrusion can be brought about by stimulation of the weak layers of involuntary muscle found in the orbits.

TRICHINÆ IN THE CEREBRO-SPINAL FLUID

OVER two years ago Dr William Lintz, of Long Island College Hospital, demonstrated for the first time the trichina spiralis in the cerebro spinal fluid of a patient suffering from trichinosis, and expressed the view that lumbar puncture might prove useful in the diagnosis of the disease. In the *Journal of the American Medical Association* of June 10th he has returned to the subject and pointed out that this discovery has been confirmed by Leon Bloch, Young, and others. It is noteworthy that in the case reported by the latter, while the parasites were demonstrable in the cerebro spinal fluid, they could not be found in the muscle tissue. Dr Lintz now reports three more cases in which he found trichinæ in the cerebro spinal fluid. All the patients were Italians who had eaten infected pork 21 days before lumbar puncture. Typical trichinosis developed. In performing lumbar puncture every precaution was taken not to introduce into the trocar parasites which might be present in the muscles of the back. The trocar was introduced with its stylet, and the latter was withdrawn only after the cerebro spinal canal was reached. In appearance the fluid was normal and showed no sediment. There was a faint trace of albumin. On centrifugalisation the sediment showed only an occasional lymphocyte and 1 to 4 trichina embryos per field. These were motile and retained their activity to some extent for three days when kept at room temperature. If the trichinæ be found in the cerebro spinal fluid with some frequency this method should prove useful in diagnosis. In the same number of the *Journal of the American Medical Association* Dr W. T. Cummins and Dr G. R. Carson report a case of trichinosis in which, after an exhaustive search of several sedimented specimens of cerebro spinal fluid, one sluggish embryo, 0.1 mm long and 0.006 mm broad, was found.

THE ACQUIREMENT OF SINGLE-HANDED DEXTERITY

MANY limbs have been lost and are still being lost in the present war and all the resources of modern surgical ingenuity are at work to replace them. Artificial arms and legs may attain a high degree of perfection and their evolution is doubtless not yet complete but there is this difference between the arm and the leg that, whereas an artificial leg can replace fairly well all the ordinary functions of the real limb and adequately serve for home and business life, the artificial hand as at present evolved can only perform a few of the functions of the real hand whose loss will always be painfully felt so long as its fellow is not specially trained in single handed dexterity. The experience of those who have lost an arm and who have become expert in the single use of the other should be of help to those who are still novices.

Count Zichy lost his right arm when he was only 14, and 51 years later at the age of 65 he published at Budapest an illustrated manual which he called the 'Book of the One armed' or 'Hints for Developing the Capacity of Becoming Independent with only One Hand.' A distinguished Viennese surgeon, Freiherr von Eiselsberg, contributes an introduction to this manual, in which he says —

I have indeed as a young student already had the opportunity of admiring your inimitable art as piano virtuoso and worthy pupil of your great master, Liszt and when I had the pleasure in later years of making your personal acquaintance I saw with astonishment of what remarkable skill your single hand was capable. The book, whose clear style and instructive illustrations I as a surgeon can specially value should be of special interest at the present time when so many are losing an arm. While a foot can comparatively easily be almost completely replaced by an artificial limb this is unfortunately not at all the case with a lost arm. The book will bring comfort to the maimed and will show that where the will is iron the loss even of an arm may be lightly borne. In reading your book who will not be reminded of Helen Keller's work, which shows what untiring diligence and practice may effect even when two important senses as sight and hearing are lost. Your book dear Count Zichy will certainly help many soldiers to bear their misfortune more easily.

Count Zichy describes in his memoirs the accident which deprived him of his arm. It was at a hunt, and his servant had left two loaded guns leaning against the back seat of the donkey cart. One of these went off at the shortest possible range severing the right brachial artery and necessitating a primary amputation. On recovering from the operation the Count was so annoyed at the irritating roughness of his servant who mocked at his helplessness that he chased him from the room and determined to dress alone. He describes the proceeding thus —

It took me three hours but I succeeded. I made use of the

Cutting the nail of the little finger while the thumb keeps the knife in position against the chest and presses on the back of the blade.

FIG 1

An example of the use of the teeth. One end of the tie is held between the teeth leaving the hand free to make the loop

door handle, articles of furniture, my feet and teeth in order to accomplish it. At table I ate nothing which I could not cut up, and to-day I peel apples, cut my nails, ride, manage a

four in hand, and with gun and rifle am quite a fair shot. If the grace of God permits me yet time on earth I will write, for the use and benefit of so many young men, the "Book of the One-armed."

Count Zichy then gives exact details in the book, with illustrations, of the various operations, four of which we reproduce here.

His closing words are full of encouragement. While repeating his warning that superhuman patience is necessary to the attainment of one armed dexterity he urges the novice to look forward hopefully to a life of independence and usefulness. "You must not pass your life in mourning," he says, "so many posts are open to you. If a soldier of high rank you may indeed continue to serve, particularly with infantry. In every business office you are available."

FIG 2

Showing a penknife being opened by the thumb and middle finger while held in place against the chest by the index finger

FIG 3

Cutting the nail of the little finger while the thumb keeps the knife in position against the chest and presses on the back of the blade.

FIG 4

Peeling an apple. The quarter is held nearly upright, the thumb pressing lightly at the lower end, while the knife begins to cut from the top. The quarter inclines as the cutting proceeds until it finally lies on the plate.

If you are not well off seek a position of trust as overseer, porter, and so forth. If you are a gamekeeper apply to the forester. I am convinced that in a factory one can attain to a certain usefulness and also on a farm."

THE SERVICES

ROYAL NAVY MEDICAL SERVICE

The following appointments have been notified—Staff Surgeons J D Keir to *Hyacinth* and J R Clark Hall to *Dolphin*. Temporary Surgeons J J Gasperine, W W K. Brown, A W Walker, and E M Harrison.

ROYAL ARMY MEDICAL CORPS

Major I A O MacCarthy is retained on the Active List and to be supernumerary.

A E Ward to be temporary Honorary Captain whilst employed at the Springburn and Woodside Central Red Cross Hospital.

Temp Captain G F Darker relinquishes his commission. Temporary Lieutenants to be temporary Captains T Perrin, R D Lawrie, R N Thomson, and C C Holman. Temporary Honorary Captain R W Collum relinquishes his commission on ceasing to be employed with St John Ambulance Brigade Hospital.

Temporary Lieutenants H Parsons and C Cooper relinquish their commissions.

Canadian Army Medical Corps. Major W H Merritt, from Canadian Artillery, to be temporary Major.

Captains to be temporary Majors R M Gorsline, E C Cole, A W McPherson, and J S Jenkins.

INDIAN MEDICAL SERVICE

The King has approved the promotion of R J Macnamara from Lieutenant-Colonel to Colonel.

The King has approved the grant of the temporary rank of Lieutenant to Narayan Mahadev Bodas, Jatis Chunder Chukerbuti, Saroj Kumar Sanyal, Bangalore Pasupuleti Balukrishna Naidu, Dhanjishaw Phirozshaw Karaka, A W Pantan, Abani Moban Ghosh, Tanguturi Janakiramiah, Philip de Mello, Jehanjir K Moolan Feroze, N B Kolsavala, Chembil Vittil Appunni Menon, A C L La Frenais, Jesudon Sellyah David, Munguldas Tuljaram Khandavalla, Kalyanpur Harihar Bhat, Premal Trambakrai Majmunder, and Rustom Pestonjee.

SPECIAL RESERVE OF OFFICERS

Royal Army Medical Corps

Cadets to be Lieutenants W L Ingham and C W Dudley, from Leeds University Contingent, Officers Training Corps, C Rudd, from Birmingham University Contingent, Officers Training Corps, H G Broadbridge, from University of London Contingent, Officers Training Corps, W C C Easton, from the Manchester University Officers Training Corps, and the following from the Edinburgh University Officers Training Corps: M Foster, J Bennet, A K Gibson, B J Ryrie, J M Smellie, D G Stoute, J A Mackenzie, W N Greer, D G Duff, A McL Ferrie, I MacKenzie, E A Mills, C Milne, J Milne, C P Penberthy, E W Fish, W Corner and R R S Weatherston.

To be Lieutenants J A Nicholson and M Stewart.

TERRITORIAL FORCE

Army Medical Services

Major (temporary Colonel) F J Brown relinquishes his temporary rank on vacating the appointment of Assistant Director of Medical Services.

Royal Army Medical Corps

East Anglian Field Ambulance D F Torrens to be Lieutenant.

London General Hospital Captain C A Pannett is seconded while holding a temporary commission in the Royal Army Medical Corps.

Wessex Casualty Clearing Station Lieutenant C A. Raison, from South Midland Casualty Clearing Station, to be Lieutenant.

East Lancs Field Ambulance Lieutenant C Hibbert to be Captain.

West Lancs Field Ambulance Lieutenant R Findlay to be Captain.

Lowland Casualty Clearing Station D Cameron and J Chalmers to be Lieutenants.

North Midland Casualty Clearing Station Lieutenant C S J Kearner to be Captain.

Northumbrian Field Ambulance Major (temporary Lieutenant-Colonel) P R Ash relinquishes his temporary rank on ceasing to command a Field Ambulance.

West Riding Field Ambulance Captain (temporary Major) H N Goode relinquishes his temporary rank on ceasing to command a Field Ambulance. Major F Whalley to be temporary Lieut Col whilst commanding a Field Ambulance.

Wessex Field Ambulance Major E B Bird to be temporary Lieutenant-Colonel whilst commanding a Casualty Clearing Station. Major (temporary Lieutenant Colonel) E B Bird relinquishes his temporary rank on ceasing to command a Casualty Clearing Station.

Attached to Units other than Medical Units—W A Milne (late temporary Lieutenant R A M C) C E Proctor and P G Phillips to be Lieutenants.

JOURNAL OF THE ROYAL ARMY MEDICAL CORPS.

First place is given in the July issue of this journal to a well illustrated paper by Captain David Thomson and Captain J Gordon Thomson on Protozoological Parasites, including investigations on the sand in Egypt undertaken to elucidate the mode of spread of amebic dysentery and the flagellate diarrhoeas. The conclusions of the authors regarding the sanitary measures necessary to the prevention of these diseases are on lines "identical with those required to prevent the other intestinal scourges, such as typhoid fever and bacillary dysentery. The authors advocate a larger sanitary staff in warm climates with bad sanitation. In a paper on the treatment of gonorrhoea Lieutenant-Colonel L W Harrison describes successful results from treatment by intramuscular injections of mercury succinimide administered in a 5 per cent solution either in three doses of 50 milligrammes or two of 75 milligrammes at intervals of three days. A paper on the Surgical and Antiseptic Values of Hypochlorous Acid (Eusol), by Captain John Fraser and Captain H J Bates, discusses the use of this antiseptic. Preliminary Observations on Disinfection of the Nasopharynx of Meningococcus Carriers by means of Air Saturated with a Solution of Disinfectant are contributed by Lieutenant-Colonel M H Gordon, and a paper on Malingering by Sir John Collie, deals with the examination of the upper extremities. Fly Traps for Camps, Hospital Precincts, and Trench Areas form the subject of an illustrated paper by Colonel Andrew Balfour, C M G, and the Louse Problem at the Western Front is very fully dealt with by Lance-Sergeant A D Peacock, M Sc, formerly entomologist to the Government of Southern Nigeria, lecturer in zoology at the University of Durham.

VITAL STATISTICS

VITAL STATISTICS OF LONDON DURING JUNE, 1916

IN the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases it appears that the number of persons reported to be suffering from one or other of the 10 diseases specified in the table was equal to an annual rate of 4.8 per 1000 of the civil population, estimated at 4,310,030 persons, in the three preceding months the rates had been 5.6, 5.3, and 4.7 per 1000 respectively. The lowest rates during the month were recorded in Kensington, Hammersmith, Fulham, the City of Westminster, and Stoke Newington and the highest rates in Shoreditch, Bethnal Green, Stepney, Bermondsey, and Deptford. The prevalence of scarlet fever showed no variation from that recorded in the preceding month, among the several boroughs this disease was proportionally most prevalent during June in the City of London, Bethnal Green, Stepney, Deptford, and Lewisham. The Metropolitan Asylums Hospitals contained 1256 scarlet fever patients at the end of the month, against 1735 in 1903, and 1325 at the end of the three preceding months, the weekly admissions averaged 159, against 208, 190 and 155 in the three preceding months. The prevalence of diphtheria showed only a trifling decrease in June, this disease was proportionally most prevalent in Hampstead, Shoreditch, Bethnal Green, Stepney, Bermondsey, and Greenwich. The number of diphtheria patients under treatment in the Metropolitan Asylums Hospitals, which had been 1417, 1331, and 1242 at the end of the three preceding months, had risen again to 1313 at the end of June, the weekly admissions averaged 152, against 160, 149, and 152 in the three preceding months. Enteric fever showed a slightly increased prevalence as compared with that recorded in other recent months of the 35 cases notified during June, 4 belonged to Paddington, 4 to Stepney, 3 to St Marylebone, and 3 to Hackney. There were 44 enteric fever patients under treatment at the end of June in the Metropolitan Asylums Hospitals, against 46, 39, and 30 at the end of the three preceding months, the weekly admissions averaged 7, against 7, 7, and 5 in the three preceding months. Erysipelas was proportionally most prevalent in Shoreditch, Bethnal Green, Poplar, and Deptford. The 20 cases of puerperal fever included 3 in Greenwich and 2 each in Islington, Holborn, Poplar, Battersea and Camberwell. The 44 cases of cerebro spinal meningitis included 5 in Stepney, 4 in Islington, and 3 each in Poplar, Southwark, Bermondsey and Lambeth. The 4 cases of poliomyelitis belonged respectively to Bethnal Green, Stepney, Bermondsey, and Camberwell.

The mortality statistics in the table relate to the deaths of persons actually belonging to the several metropolitan boroughs, the deaths occurring in institutions having been distributed among the boroughs in which the deceased persons had previously resided. During the four weeks ending July 1st the deaths of 3787 London residents were registered, equal to an annual rate of 11.5 per 1000, in the three preceding months the rates had

* Including membranous croup.

been 181, 172 and 12.9 per 1000. The death rates in June ranged from 7.8 in Hampstead, 8.9 in Wandsworth, 9.0 in Lewisham, 10.1 in the City of Westminster, 10.3 in Paddington and 10.4 in Battersea and in Camberwell to 12.7 in Chelsea and in Poplar, 13.2 in Kensington and in Southwark 13.7 in Shoreditch and 16.5 in Finsbury. The 3787 deaths from all causes included 235 which were referred to the principal infectious diseases, of these, 74 resulted from measles, 7 from scarlet fever, 50 from diphtheria, 60 from whooping-cough, 7 from enteric fever, and 57 from diarrhoea and enteritis among children under 2 years of age. No death from any of these diseases was recorded during the month in Stoke Newington or in the City of London, among the other boroughs they caused the lowest death rates in Hampstead, Holborn and Woolwich, and the highest rates in Chelsea, Islington, Finsbury, Southwark, and Bermondsey. The 74 deaths from measles were 53 fewer than the corrected average number in the corresponding period of the five preceding years; this disease was proportionally most fatal in St. Pancras, Islington, Hackney, Southwark, Battersea, and Greenwich. The 7 deaths from scarlet fever were 11 below the corrected average number, and included 2 in Battersea and 1 each in Poplar, Lambeth, Deptford, Lewisham and Woolwich. The 30 fatal cases of diphtheria showed a decline of 8 from the corrected average number, of the 30 deaths from this disease 5 belonged to Southwark, 3 to Bermondsey, 3 to Wandsworth and 2 each to Islington, Shoreditch, Poplar and Greenwich. The 60 deaths from whooping-cough were 12 below the average; the greatest proportional mortality from this disease was recorded in Hammersmith, Islington, Finsbury and Poplar. The 7 deaths from enteric fever were equal to the corrected average number and included 2 in Stepney and 1 each in Kensington, Chelsea, the City of Westminster, Islington, and Camberwell. The 57 deaths from diarrhoea and enteritis among children under 2 years of age were 14 below the corrected average number; this disease was proportionally most fatal in Paddington, Kensington, Fulham, Chelsea, the City of Westminster, St. Marylebone, Islington, Finsbury, and Bermondsey. In conclusion it may be stated that the aggregate mortality in London during June from these principal infectious diseases was 30.5 per cent below the average.

HEALTH OF ENGLISH TOWNS

In the 96 English and Welsh towns with populations exceeding 50,000 persons at the last Census, 7929 births and 3469 deaths were registered during the week ended Saturday, July 29th. The annual rate of mortality in these towns, which had been 11.1, 10.9, and 11.1 per 1000 in the three preceding weeks, fell in the week under notice to 10.4 per 1000 of their aggregate civil population estimated at 17,312,295 persons for the year 1915. During the first four weeks of the current quarter the mean annual death rate in these towns averaged 10.8, against 10.7 per 1000 in London. Among the several towns the death rate last week ranged from 3.2 in Oxford 3.4 in Enfield 3.7 in Wimbledon, 3.9 in Ilford, and 5.5 in Southport, to 14.7 in Middlesbrough and in Burnley 15.1 in Sunderland, 15.4 in Cambridge, 16.4 in Darlington, and 22.8 in Bury.

The 3469 deaths from all causes were 206 below the number in the previous week, and included 221 which were referred to the principal epidemic diseases, against numbers declining from 335 to 212 in the eight preceding weeks. Of these 221 deaths, 72 resulted from infantile diarrhoeal diseases, 64 from measles, 36 from whooping-cough, 35 from diphtheria, 9 from scarlet fever, and 5 from enteric fever, but not one from small pox. The annual death rate from these diseases was equal to 0.7, against 0.7, 0.7 and 0.6 per 1000 in the three preceding weeks. The deaths attributed to infantile diarrhoea, which had been 54, 51, and 46 in the three preceding weeks rose to 72, of which 16 occurred in London and 5 in Liverpool. The deaths from measles, which had been 60, 62 and 59 in the three preceding weeks, rose last week to 64 and included 14 in London, 11 in Sheffield, 6 in Liverpool, 5 in Manchester, and 4 in West Ham. The fatal cases of whooping-cough, which had been 61, 40 and 42 in the three preceding weeks, fell to 36, and included 4 each in London, Birmingham, and Liverpool, and 3 in West Ham. The deaths from diphtheria, which had been 36, 47 and 43 in the three preceding weeks, fell to 35 last week, and included 12 in London, 3 in St. Helens, which had been 4, 15, and 17 in the three preceding weeks, fell to 9 last week of these 9 deaths 3 belonged to London. The fatal cases of enteric fever, which had declined from

13 to 5 in the five preceding weeks, were again 5 last week and showed no excess in any particular town.

The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital, which had declined from 1303 to 1216 in the five preceding weeks, rose slightly to 1221 on Saturday last, 171 new cases were admitted during the week, against 170, 150, and 172 in the three preceding weeks. These hospitals also contained on Saturday last 1288 cases of diphtheria, 184 of measles, 153 of whooping-cough and 40 of enteric fever, but not one of small pox. The 878 deaths from all causes in London were 17 fewer than the number in the preceding week, and corresponded to an annual death rate of 10.6 per 1000. The deaths referred to diseases of the respiratory system, which had been 95, 117, and 99 in the three preceding weeks, fell to 90 in the week under notice.

Of the 3469 deaths from all causes in the 96 towns, 136 resulted from violence. 296 were the subject of coroners' inquests, and 1054 occurred in public institutions. The causes of 31, or 0.9 per cent, of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in London and its 14 suburban districts, in Bristol, Leeds, Sheffield, and 60 other smaller towns. Of the 31 uncertified causes, 7 were registered in Birmingham and 6 in Liverpool.

HEALTH OF SCOTCH TOWNS

In the 16 largest Scotch towns with an aggregate population estimated at 2,372,000 persons at the middle of this year, 1029 births and 566 deaths were registered during the week ended Saturday, July 29th. The annual rate of mortality in these towns, which had been 12.4, 12.6, and 11.2 per 1000 in the three preceding weeks, rose to 12.5 per 1000 in the week under notice. During the first four weeks of the current quarter the mean annual death rate in these towns averaged 12.2, or 1.4 per 1000 more than that recorded in the large English towns. Among the several towns the death rate last week ranged from 5.7 in Perth, 9.0 in Dundee, and 9.2 in Coatbridge, to 17.4 in Greenock and 18.7 in Hamilton and in Ayr.

The 566 deaths from all causes were 55 above the number in the previous week, and included 37 which were referred to the principal epidemic diseases against 44 and 39 in the two preceding weeks. Of these 37 deaths, 15 resulted from infantile diarrhoeal diseases, 7 from measles, 6 from diphtheria, 5 from scarlet fever, and 4 from whooping-cough, but not one from either small pox or enteric fever. The annual death rate from these diseases was equal to 0.8, against 0.7 per 1000 in the large English towns. The deaths attributed to infantile diarrhoeal diseases, which had been 5, 8, and 7 in the three preceding weeks, rose last week to 15, and included 9 in Glasgow, 3 in Edinburgh, and 2 in Ayr. The deaths from measles, which had declined from 19 to 18 and 17 in the three preceding weeks, further fell to 7 last week and included 5 in Glasgow. The fatal cases of diphtheria, which had been 5, 3, and 6 in the three preceding weeks were again 6 last week, 2 deaths occurred in Glasgow and 2 in Edinburgh. The deaths from scarlet fever, which had been 5, 7, and 3 in the three preceding weeks, rose to 5 last week, and included 3 in Glasgow. The fatal cases of whooping-cough, which had been 8, 8, and 3 in the three preceding weeks, were 4 last week, all 4 deaths were registered in Glasgow.

The deaths referred to diseases of the respiratory system, which had been 64, 50, and 62 in the three preceding weeks, declined to 40 in the week under notice and were 6 below the number registered in the corresponding week of last year. The deaths from violence numbered 32, against 16 and 22 in the two preceding weeks.

HEALTH OF IRISH TOWNS

In the registration area of Dublin 193 births and 110 deaths were registered during the week ended Saturday, July 29th. The annual rate of mortality, which had been 17.6, 18.8, and 15.2 per 1000 in the three preceding weeks fell to 14.4 per 1000 in the week under notice against 10.6 and 12.4 per 1000 in London and Glasgow respectively.

Of the 110 deaths at all ages, 22 related to infants under 1 year and 25 to persons aged 65 years and upwards. Four deaths of infants (under 2 years of age) were referred to diarrhoeal diseases.

The causes of 4 deaths were uncertified, and 4 others were the subject of coroners' inquests, while 49 or 45 per cent, of the total deaths occurred in public institutions.

During the same period 155 births and 93 deaths were registered in the city of Belfast. The deaths corresponded to an annual rate of 12.4 or 2.2 per 1000 less than in the previous week, and included 17 of infants under 1 year of age and 18 of persons aged 65 years and upwards. One death was referred to measles and 1 each to scarlet fever, whooping-cough, and infantile diarrhoeal diseases. The cause of 1 death was uncertified and 4 others were the subject of coroners' inquests, 34 deaths occurred in public institutions.

Obituary.

SIR WILLIAM HENRY POWER, K.C.B., F.R.S.,
F.R.C.S. ENG.,
LATE PRINCIPAL MEDICAL OFFICER OF THE LOCAL GOVERNMENT BOARD.

It is with feelings of the deepest regret that we announce the death, in his 74th year, of Sir William H. Power, K.C.B., who died at his residence in East Molesey on July 28th.

Sir William Power had the distinction of belonging to an old medical family, and was the fifth representative of the profession in direct succession from father to son, beginning with John Power, a surgeon in Warwickshire born in 1733. He received his early education at University College School, after which he became apprenticed, as a medical student, to his father, Dr. William Henry Power, of Ladywell, Kent. Later he entered St. Bartholomew's Hospital and qualified as a Member of the Royal College of Surgeons and as a Licentiate of the Society of Apothecaries in 1864. He devoted the next six years to the practice of clinical medicine and surgery, and held several important hospital appointments. For some years he was resident medical officer to the Victoria Park Hospital for Diseases of the Chest, and here he acquired that intimate knowledge of pulmonary tuberculosis which proved so useful to him in his subsequent investigations of problems associated with that disease. By a strange coincidence, Power commenced his life's work in the very year that the Local Government Board was created by joining the medical department, as a temporary medical inspector, in 1871. In that year the medical department of the Privy Council had been transferred to the newly formed Local Government Board, and comprised such well known men as John Simon, Scates Buchanan, Thorne Netten Radcliffe, and Ballard. With these distinguished men as colleagues Power commenced a public health career, which was destined to be fruitful in advancing our knowledge of all branches of preventive medicine and in evolving the organisation of the public health administration of this country. The aims and objects of these pioneers were well expressed in the writings of Sir John Simon, who stated: "I believe we had the credit of earnestly endeavouring to learn the truth and tell the truth, as to the matters which our inquiries regarded." Power was a real prophet and professor of truth. He possessed in a remarkable degree the faculty of observation, doubtless first awakened by a love of natural history which remained with him a passion throughout his life, while his ability to weigh facts and adduce from them correct conclusions has rarely, if ever, been excelled by any worker in medical research. These rare gifts were applied by him in elucidating many problems connected with infectious diseases, the far reaching results of his work in this connexion being well known to every student of public health.

Perhaps one of the most striking of Power's inquiries was that in relation to the part played by small pox hospitals in influencing the distribution of the disease in their neighbourhood. He found that increased incidence of small pox in the surrounding districts followed the admission of acute cases into Fulham Hospital, and that if the surrounding area were divided into zones by means of circles drawn upon the map, with the hospital as a centre and a quarter, half, three quarters and one mile radii respectively, the proportion of invaded houses to the total number of houses in each zone diminished as the distance from the hospital increased and that this relation held good in each quadrant of each zone. The distribution of the cases was not such as to suggest any relation to lines of traffic to and from the hospital or to ambulance routes. These remarkable facts formed the basis of the theory of aerial convection of small pox infection which was formulated by Power and led to results of great practical importance. The small pox hospitals of the Metropolitan Asylums Board were formerly situated within, or in the outskirts of, London and were in most instances surrounded by thickly populated areas. Power's statistics of small pox incidence in the registration districts of London during the years 1876-85 relatively to the operation of small pox hospitals in the metropolis proved that for whatever reason the local distribution and intensity of small pox during the epidemics which occurred in the period under review had been influenced in large measure by the

proximity or otherwise of the London small pox hospitals. The figures demonstrated that there were instances in which the opening of such hospitals for the reception of acute cases of small pox in parts of London hitherto comparatively free from the disease had been followed by severe local outbreaks in the immediate neighbourhood of the hospitals. Subsequently, as is well known, the use of these hospitals in London was abandoned, and all cases of small pox were removed to institutions situated outside the metropolis. With the inauguration of this departure small pox ceased to prevail on anything like the scale recorded when the hospitals were within the metropolitan area.

Power was the first to demonstrate that diphtheria could be spread through the agency of milk. The facts on which this conclusion was based are contained in a report to the Local Government Board, dated December, 1878

on an epidemic prevalence of diphtheria in North London. He also showed that milk-borne scarlet fever was not in every case due to specific contamination of the milk from a human source, but that the cow was prone to a disease apparently of a similar character, and that consumption of the milk of such unhealthy animals was capable of producing scarlatina form disease in the human subject. This hypothesis was first suggested by Power in connexion with a scarlet fever outbreak investigated by him in St. Giles and St. Pancras in 1882, and was definitely established by the circumstances of the classical outbreak in Marylebone and other London districts in 1885, which was associated with a farm at Hendon. An account of this outbreak appears in the fifteenth annual report of the medical officer of the Local

Government Board, dated 1885. One of the most notable instances of Power's remarkable insight into natural phenomena was furnished by his pronouncement in regard to the causes which give rise to the ability possessed by certain waters of dissolving lead. After study of the subject generally he suggested that the inscrutable behaviour of soft moorland waters in regard to their plumbo-solvent action was probably due to low forms of organic life. Inquiry was then made into the matter on an extensive scale, by the medical department of the Local Government Board, when Power's hypothesis was abundantly proved, it being shown by Houston that the acidity of such waters and their consequent plumbo-solvent ability were due to the presence

of acid producing bacteria in the peat of the gathering grounds from which such waters were derived. The elucidation of this problem led to far reaching results, for when steps were taken to neutralise the acidity of these plumbo-solvent waters before delivery to the houses of the consumers, lead poisoning, due to dissolved lead in the drinking water, which had been very prevalent in certain of the industrial communities of the north, practically ceased, and is now rarely met with in this country.

In 1887 Power was promoted from the rank of inspector to be assistant medical officer in which capacity he remained until the retirement in 1892 of Sir George Buchanan, when he became the first assistant medical officer. Following upon the death of Sir Richard Thorne, he was appointed in 1900 Principal Medical Officer of the Board which

office he retained until 1908, when he reached the official age for retiring from the Civil Service. It was while acting as assistant medical officer that he established those intimate personal relations with the medical staff which were largely responsible for the excellent work done by the department during the remainder of his tenure of office. One of the most modest of men, with a physical dread of notoriety, he constantly kept in the background while helping others to attain success—not merely his colleagues at the Local Government Board, but also a large circle of friends who were in the habit of seeking his advice on a wide range of subjects associated with medical problems. In directing the work of the medical inspectors his shrewd judgment of the capacities of each man on the staff enabled him to choose the inspector whose

talents were most suited to any particular piece of work which had to be done, while his remarkable powers of intuition and constructive criticism combined with the kindness of his personality rendered his influence widely felt. It is lamentable that no less than seven of the men whom Power trained as medical inspectors, and who so largely contributed during his time to the strength of his department, have predeceased him. Apart from the three assistant medical officers, the present medical staff unfortunately includes only a few men who had the privilege of being associated with Power in the study of national problems of public health.

Power rightly considered that one of the best methods of securing sanitary reform throughout the country was by

SIR WILLIAM HENRY POWER, K.C.B.,
LATE PRINCIPAL MEDICAL OFFICER TO THE LOCAL GOVERNMENT BOARD
(Reproduced from a Drawing in Water-colours)

drawing public attention, through official publications, to the conditions obtaining in insanitary districts, and a considerable portion of the time of the medical staff was, in his day, occupied in inquiring into the sanitary circumstances and administration of the more backward districts of England and Wales. We cannot imagine a more valuable work by the central health authority than this, and, as a matter of fact, it led to material improvement in the health conditions of many parts of the country. Sometimes it resulted in local reform, while in other instances the published reports came to form a mass of official evidence which acted as a strong impetus to general legislation or to better central administration in sanitary matters. Another fundamental principle in Powers' schemes of reform was to press on his department the necessity of improvement in the education and remuneration of sanitary inspectors. These officers perhaps do not know how great a friend they have lost, for Power seldom told anyone of his accomplished work.

Long before his appointment as assistant medical officer Power was entrusted with the important task of editing the reports appearing in the Annual Reports of the Medical Officer under the heading "Scientific Investigations," and this work he retained, as a labour of love, till the very last, notwithstanding the many and increasing duties which devolved upon him. Many of the inquiries conducted by the Board's medical staff during Power's tenure of office led to the publication of official reports which formed standard works on the subjects with which they dealt—such as, for example, "The Influenza Epidemic of 1889-90," by Franklin Parsons, "Oyster Culture in Relation to Disease," by H. T. Balstrode. It was mainly through Powers' efforts that in 1904 a foods department was established by the Local Government Board on lines which had been carefully thought out by him for a long time beforehand. The results which this new branch has achieved have more than justified the anticipations of its founder, more especially since the outbreak of the present war, during which it has rendered valuable services to the State.

On the death of Sir Richard Thorne, Power was appointed a member of the Royal Commission on Sewage Disposal. The scientific work of the experts employed by the Commission was, in great part, carried on under his direction and forms the basis of our present knowledge of the principles and practice of sewage disposal. He was closely associated with the work of the Royal Commission on Tuberculosis (Human and Bovine), while the late Sir Michael Foster was its chairman, and on his death was nominated to the chair of that Committee. He acted for some years as the Crown nominee on the General Medical Council. He was the recipient of the Jenner medal of the Epidemiological Society of London, the Bisset-Hawkins medal of the Royal College of Physicians, London, the Stewart prize of the British Medical Association, and the Buchanan medal of the Royal Society. The value of his scientific work was recognised by his election as a Fellow of the Royal Society in 1895.

In his early days Power was, as might be expected from his fine physique, an athlete, and gained some distinction as a cricketer. He was also an adept in the use of the gun and found some relaxation in duck shooting during the few short absences which he allowed himself from official duty. He was married early in his official career but lost his wife after only four years of married life. He leaves two daughters.

It is difficult to do justice to the memory of Sir William Power. While respected by all and beloved by those who had the privilege of coming intimately in contact with him, it is probable that, owing to his retiring disposition, few have recognised, at its true value, the importance of his achievements which were so silently accomplished. It was perhaps only among his own staff that the wide scope and effect of his work were fully known and appreciated. Medicine, more than any other science has attracted from the earliest times men of outstanding ability and originality of thought, who have devoted their lives to study of the phenomena presented by the human subject in health and disease. To few such men has nature yielded her secrets more abundantly than to Sir William Power, whose work in the cause of hygiene will ever be an inspiration to those who promote the welfare of their fellow creatures by helping to maintain and improve the public health.

THOMAS JAMES WALKER M.D. LOND., F.R.O.S. EX
CONSULTING SURGEON TO THE PETERBOROUGH INFIRMARY

THE death of Dr T. J. Walker, of Peterborough, deprives the ranks of general practitioners of one of their oldest and most distinguished members.

Thomas James Walker was born in 1835 at Peterborough, where his father was a well known medical man, he came of a strong stock for both his parents passed the age of 90. He was educated at the University of Edinburgh, was a demonstrator of anatomy to Goodair, and graduated at the University of London, carrying off the University gold medal in physiology at the first M.B. examination and that in medicine at the final examination in 1857. After graduation he was appointed medical tutor at Queen's College,

THOMAS JAMES WALKER M.D. LOND.

Birmingham, which had just been founded, and was subsequently elected assistant physician to the Queen's Hospital. He was urged to practise in Birmingham as an obstetric physician, but he felt it his duty to join his father in general practice. Before doing so he went to Vienna for six months, and there he was especially attracted by laryngology. Czermak having just demonstrated the clinical value of the laryngoscope, Walker's interest in this subject never flagged. In THE LANCET of Nov. 9th 1861 he published the first case in England, in which a laryngeal polypus was removed. 20 years later at the International Medical Congress in London in 1881 he was one of the secretaries of the Section of Laryngology, and the last paper he wrote in 1913, was entitled "A Retrospect of Laryngology 1860-1910." But when he entered on a busy general practice his tastes grew catholic and he became the rare example of a first rate all round man.

For 54 years he spent an extremely busy life and took few holidays. In 1862 he was appointed surgeon to the Peterborough Infirmary and held that office for 42 years, seeing in and out-patients with the utmost regularity and although there were only a few beds he utilised his opportunities to the utmost. He was always on the look out for new methods and fresh ideas, he was a successful ophthalmologist in the early days of that operation, and was one of

the first in this country to perform gastrojejunostomy successfully. He adopted Listerian methods when they were introduced and had the operating theatre of the infirmary reconstructed that he might adapt his methods to the teachings of the aseptic school. He was a neat and successful operator and was a particularly dexterous lithotomist at the time when vesical calculus was a common complaint in the Eastern counties—a local feature which seems to be disappearing. His reputation spread rapidly, and his services as an operator and his advice in consultation were sought by colleagues over a wide area. He had little leisure for literary work beyond the narration of interesting single cases in the journals, two papers, however, which broke new ground ought to be mentioned. In the *Transactions of the Royal Medical and Chirurgical Society* for 1889 he published a paper on Colourless or Clay coloured Stools Unaccompanied by Jaundice, connected with Disease of the Pancreas, which proved the undisputed part played by the pancreas in the colouration of the stools. In 1905 he published in the *Clinical Transactions* a series of cases of Acute Ascending Paralysis in Patients Suffering from Chronic Cystitis. He also wrote the articles on Diseases of the Larynx in the first edition of Quain's "Dictionary of Medicine." When the Royal Society of Medicine was founded he was one of the first members of council, and he was more than once elected President of local branches of the British Medical Association for his high position in his own district was not due to his professional attainments alone. His character and his high ideals earned him universal respect while his firm, kindly manner and his considerate thoughtfulness endeared him to all his patients. Rich and poor alike knew that he took a real personal interest in them, and many of them would seek his advice in circumstances of difficulty which had no relation to medicine.

Amid the heavy calls of practice Dr Walker cultivated other interests. A learned archaeologist, he formed a valuable collection of Saxon and Roman remains, found near Peterborough and bequeathed them to the city. He recently spent most of his scanty leisure in researches, both locally and at the Public Record Office, into the history of French prisoners of war in Napoleonic times: a large detention camp having existed for some years at Norman Cross, near Peterborough. These researches were embodied in a book, "The Depot for Prisoners of War at Norman Cross, Huntingdonshire 1796-1816" which is of interest at the present time, as its pages show by contrast how much more humane are the methods now adopted in this country in dealing with prisoners of war. He was an enthusiastic Volunteer in the early days of the movement, went to camp every year with his battalion, and ultimately became lieutenant-colonel and received the V.D. It is interesting to note that six of his sons are serving in the Navy or Army in the present war. He threw himself energetically into all local schemes for social improvement and was a sober advocate of temperance. He was a good rider and keen sportsman. On his eightieth birthday his city honoured him by making him an honorary freeman and a few months later his portrait was presented to him by public subscription.

Until recently there was no abatement of his energy, and in spite of his years he did a day's work which would have tried much younger men. But in the last 18 months troubles came quickly upon him. His wife died after 50 years of happy married life and a few months later Dr George Kirkwood his partner and close friend for 40 years also died. These blows told on his strength. In June he had a severe feverish attack, which compelled him to take to his bed. His strength failed rapidly, and he died on July 19th. Thirteen children survive him of whom four have adopted their father's profession—Dr Walter Walker, Dr Alec Walker, and Captain J. Walker, R.A.M.C. (T) (who were in partnership with him), and Captain Russell Walker, R.A.M.C.

BUSHFELL ANNINGSOON B.A., M.D. CAMB.

LECTURER ON MEDICAL JURISPRUDENCE AT THE UNIVERSITY OF CAMBRIDGE.

With Dr Bushell Anningsoon has passed away, at the advanced age of 78 years a well known figure in Cambridge and one associated with the public health administration of the neighbouring districts over a period of 40 years.

Bushell Anningsoon came of a Lincolnshire family and was born at Idle in Yorkshire. His father was in medical practice in London and wished his son to follow in his own

profession, sending him to Gonville and Caius College, Cambridge, in 1865. Anningsoon early showed his aptitude for his studies, gaining two scholarships when an undergraduate and taking honours in the Natural Science Tripos. He passed his M.B. in 1869, taking the M.D. degree in 1877 with a thesis upon the Infective Constituents of Vaccinia Lymph. In the meantime he was demonstrator to Sir George Humphry, then professor of surgery. In 1875 Anningsoon obtained his first public health appointment under the Cambridge Improvement Commissioners, and this was the commencement of a series of appointments which ultimately brought under his administration an area exceeding 500 square miles. Most of the sanitary and preventive measures now in operation in the borough of Cambridge were initiated by him notably the Infectious Diseases Hospital and the sewage works. Although fully occupied in administrative work, Anningsoon held with distinction teaching appointments in the University of Cambridge. He was lecturer on medical jurisprudence, and one of the earliest teachers of sanitary science in the country. The establishment of the Diploma of Public Health was one of the products of his activity. His merits were recognised by public bodies in this and other countries. He was University delegate at the Hygienic Congress at Budapest in 1894 and at Madrid in 1898, he was an associate of King's College, London, and of the Société d'Hygiène de France, and a member of the council of the Royal Sanitary Institute. Anningsoon was an indefatigable worker, and it was in the midst of his strenuous work that he died. He contributed articles to many journals, and of other works published by him we may mention the "Evolution of Human Communities in Relation to Disease" and the "Origin and Progress of Sanitary Endeavour."

In 1888 Dr Anningsoon married the only daughter of Mr Samuel Davy, of Christchurch who survives him.

THE LATE DR W. W. H. TATE

In reference to the obituary notice of Dr Tate, which appeared in our last week's issue, Dr Herbert Spencer writes—"I knew Walter Tate well for more than 30 years. He obtained his first resident appointment at University College Hospital in 1888, a few months after I was elected to the staff, and afterwards he became house physician and resident medical officer to the hospital, in all these appointments he was assiduous in the performance of his duties and most popular with patients, nurses, students, and staff. Ever since those days, in which he laid the foundation of a successful gynaecological career in a wide general training I have watched his work with admiration and maintained an unbroken and unclouded friendship, which, cut short by the hand of death leaves a feeling of sadness and grief, assuaged by the sweet memory of a man of high principles and honour, a charming personality, and one of the best and most unselfish men I ever knew. Appointed to St Thomas's Hospital, and succeeding Dr Cullingworth at an early age, Walter Tate soon acquired an extensive experience in gynecology, in which he was a skilful and successful operator, and made many valuable contributions to literature. He was devoted to his hospital work and took much pains in teaching the students with whom he was very popular. Equally devoted to him were his private patients of all ranks, who could not fail to appreciate his kindness, geniality, sound judgment, honesty and skill. Bold in performing necessary operations, he was averse from performing those which his experience, judgment, and humanity led him to know to be of doubtful utility. Though devoted to no 'sport,' Walter Tate had in an unusual degree the faculty of warming both hands at the fires of life, work and play, in both of which he took great pleasure. His 'play' of late years took the form of motor trips through many parts of England and in social meetings with his friends. Some of his excellent professional work is recorded in transactions and journals, the memory of his genial, cheerful, charming, and sterling personality will ever remain enshrined in the hearts of his friends."

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL (UNIVERSITY OF LONDON).—The Burney Yeo scholarships for 1916 have been awarded to Robert Roberts B.A., Balliol College, Oxford, J. Myles Bickerton B.A., Pembroke College, Cambridge and Geoffrey Arthur Harrison, B.A., Gonville

Correspondence.

THE WORK OF THE REGISTERED HOSPITALS FOR THE INSANE

To the Editor of THE LANCET

SIR,—I have read with great interest Dr Henry Rayner's protest against the small amount of charitable work done by some of the registered mental hospitals in England. I think he will agree that this has for a long time been well known to all engaged in consultative work in mental medicine, and I was disappointed in noting his definite statement that the Board of Control had no power to compel some of these institutions to live up to the purpose for which they were originally licensed. We know well those institutions which are doing true charitable work, in spite of not being able to make their actual earnings meet their yearly expenditure, but we also know the difficulties we often experience in our attempts to get deserving cases taken into some registered hospitals at a small weekly payment. The poor middle class mental patients have of late years been able to gain admission to many of our rate supported asylums at a minimum charge of £1 1s to £1 5s a week, and we have in the many cases coming to us welcomed this help. I fear, however, even in the case of some of these public asylums there has developed a tendency to build palatial annexes out of the ratepayers' money and enter into competition with private institutions with large amounts of capital invested. I only heard the other day from a very reliable source of one such public asylum receiving patients paying very high terms, and I know that to get a deserving case into this institution at a small weekly payment is often not at all an easy thing to do. I believe I am stating a fact when I say that many of the private asylums of this country do more real charitable work than those institutions which were given a licence on the specific understanding that their profits should be utilised to help those who could not afford more than a small weekly sum.

The great fact that must be continually brought forward in all these discussions is that, according to the reports of the Commissioners in Lunacy, the recovery rate of mental diseases is to-day no higher than it was in the "seventies" of the last century. The ever increasing difficulty in getting mental cases with small means quickly under skilled care must, I feel sure, account to a great extent for this lamentable fact.

If the Board of Control have no existing powers to remedy this evil, surely it would not be difficult to get a small Act passed enabling them to have more real authority over these institutions.

I am, Sir, yours faithfully,

L. A. WEATHERLY, M.D. Aberd.

Bournemouth July 29th, 1916

AORTIC INCOMPETENCE, DIGITALIS, AND THE WAR-WORTHY HEART

To the Editor of THE LANCET

SIR—So long ago as 1829 Hodgkin concluded from his own experience,¹ that neither blood letting nor digitalis was advisable in cases of "retroversion of the aortic valves." Corrigan, with whose name aortic incompetence is frequently associated, contrasted aortic with mitral lesions, and regarded digitalis as dangerous in cases of "inadequacy of the aortic valves."² In all subsequent discussion on this point there has been that defence of and objection to, the use of digitalis in aortic incompetence which denotes a theme marked by uncertainty based on experience. Perhaps the most satisfactory and tersely expressed opinion on the subject is that of the late Sir William Broadbent when he states³ that digitalis is only useful in cases of aortic regurgitation manifesting "mitral symptoms"—in other words when the power of the ventricle to fulfil its functions efficiently has waned. That digitalis under any circumstances is only indicated

when cardiac force has ceased to be equal to propulsive need will scarcely be questioned. Dr Seymour Taylor, in his interesting paper in THE LANCET of July 15th, arrives at a sound conclusion when he writes of the "seriousness of aortic regurgitation," and you also echo in the leading article on Aortic Incompetence in your issue of July 22nd a similar opinion, and one which would scarcely have required restatement had not some of recent years, with altogether unjustifiable emphasis, relegated to the limbo of childish conceptions that importance of the mechanical factor in the circulation represented by the valvular apparatus.

I agree with Dr Taylor that clinical experience is at least as valuable as laboratory research, but the two, on the whole, are very helpful to one another although the physiologist at times claims a degree of authority in practical medicine which the physician cannot concede. A laboratory study of the development of the heart is, however, very enlightening both as to the value of the valvular apparatus in maintaining the circulation and in sparing the work of the heart. The valves develop late, they are the finishing touch given to the cardiac mechanism. Prior to the completion of the aortic valves the circulation is not steadily progressive but oscillatory, to and fro, see saw, and this in proportion to the slowness of cardiac action. It is less oscillatory when the circulation is quickened, and more so when it is slowed. There is, indeed, no more perfect picture of Corrigan's pulse than that seen in the developing heart before the aortic valves are competent.

Experimental physiology teaches the same lesson. Marey and Chauveau⁴ showed by experiment on the horse that destruction of the aortic valves caused a rise both of intra-ventricular pressure and heart rate, while Corrigan noted⁵ what we know to be true of the otherwise normal heart affected with aortic valvular disease—namely, that the heart rate has a high average. Corrigan placed it at 110 beats a minute. As the effect of digitalis is not only to increase muscular tone, but to lower cardiac rate it finds a useful place only when the power of the heart is diminished and its rate very considerably increased, so much increased that its reduction to 100 or so a minute may be regarded as low. In a paper on the Treatment of Aortic Valvular Disease,⁶ I endeavoured to show that lesions requiring increased propulsion, of which aortic incompetency is the best example, need acceleration in action, while those requiring increased aspiration demanded cardiac retardation. While atropin in small doses is the best cardiac accelerant, digitalis is without doubt the best retardant, and may have to be pushed boldly even in aortic incompetence when the heart has failed.

As regards prognosis and work capacity in aortic valvular disease on which, as on many other points in Dr Taylor's paper it is not possible to dwell here, much depends upon two factors: (1) the etiology of the condition and (2) the character and amount of the lesion. As regards the first point, an aortic incompetence due to specific disease with a concurrent obliterative endarteritis which may be often assumed to exist, is, even in a young subject of graver prognosis than the same condition arising from rheumatic valvulitis or senile change unless the cardio motor (nodal) mechanism be involved. With reference to the amount of lesion, Dr Taylor writes of one of his cases of aortic regurgitation as showing "accentuation and reduplication of the second sound over the pulmonary artery." Inasmuch as the second sound is due to the closure of the sigmoid cusps of both the pulmonary artery and the aorta and its reduplication to asynchronous closure of these valves, it is manifest that both valves must have been fairly competent to have yielded the reduplication noted. But the estimation of the amount of valvular lesion is admittedly a difficult matter, yet it should be attempted unless we adopt the attitude of the cult which regards the valvular state as negligible. This particular heresy, however, promises to be short-lived, and your leading article correctly asserts that "the victim of aortic incompetence must be rigidly excluded from the Army." To this it may be added with equal emphasis that the bearer of any organic valvular lesion whatever should also be excluded. I have personally had to advise the exclusion from the Army of

¹ Circ. d. Sang. pp. 674-75.² Loc. cit.³ Brit. Med. Jour., March 14th 1896.⁴ Loc. cit. p. 97.⁵ London Medical Gazette vol. III. p. 412.⁶ Edin. Med. and Surg. Jour. April 1st, 1832.⁷ Heart Disease, p. 117.

victims" of valvular disease considered war worthy by me disciples of the cult in question

I may refer, in conclusion, to the perplexities of your correspondent, Captain Adolphe Abrahams, whose letter appeared in THE LANCET of July 29th, induced by a study of Captain John Parkinson's paper in your issue of July 22nd, in carefully collected and well weighed data in which render valuable His suggestion of an objectively flawless but essentially inadequate heart is quite in accordance with probability Some years ago I contributed an article to THE LANCET on Cardiac Inadequacy, borrowing the term from an expression used by the late Sir Andrew Clark in discussing "renal inadequacy" In the paper referred to I examined the question of cardiac inadequacy rather fully and that there is a native difference in organic adequacy will scarcely be disputed, and I agree with Captain Parkinson that only a moiety of the more or less rapid and easily accelerable hearts met with in so-called "soldier's heart" are referable to hyperthyroidism Sir James Barr's contention that cases of hyperthyroidism without pronounced enlargement of the gland are overlooked is, however, probably correct

That defective endocrine tone plays a part in these cases is probable and is shown by the lack of sustained energy in cardiac action. This loss of tone appears to me to be of neural origin and the determination of what I have termed the cardio-pulmonary reflex is, I believe a valuable index to the power of adaptation shown by the heart under exertion An easily elicited retardation of the heart while unaccelerated, on deep respiration and a rapid return to the normal rate on the cessation of exertion, I have been taught by experience to regard as indicative of that control which denotes good cardio vascular tone I therefore find myself quite in accord with Captain Abrahams in ascribing importance to undue prolongation of acceleration after a given work test, and have myself employed it as such and have advised others to do so also On the other hand, a native cardiac inadequacy without any evidence of organic or persistent disease may quite validly exclude a man from military service

There can also be little doubt as Captain Abrahams suggests, and it has before been pointed out, that there is a considerable psychical element in many cases of so called "soldier's heart" The conditions of modern war are even more calculated to induce the neurasthenic state and bring such tendencies into activity than the conditions of previous wars The frequent night attacks and high explosives denoting as they do banished sleep and excessive stimulation, are well calculated to produce shock and disorder, especially although by no means exclusively in more highly strung individuals The cord tends to vibrate long after it has been struck, and to emit frequently a music far from exhilarating For this reason the aggregation of neurasthenic cardiopaths in a special Cordarium such as that which has recently been established at Hampstead, has always appeared to me to be wrong in principle Such cases can be as well investigated and, I believe, more successfully treated outside an emphasised cardiopathic atmosphere

I am, Sir yours faithfully

ALEXANDER MORISON

Upper Berkeley-street, W July 29th 1916

THE SHOCKLESS OPERATION

To the Editor of THE LANCET

SIR,—I was much interested to read Dr Manson Ferguson's letter in your issue of July 15th in answer to my article on this subject I notice that Dr Ferguson prefers local anaesthesia with the patient fully conscious to the method advocated in my paper While this may be an advantage when operating upon hardy Scotch patients and when a skilled anaesthetist is not easily obtainable it is not generally speaking, I think, as good a method as that in which the patient is kept unconscious Very many patients cannot face with equanimity a long operation upon themselves even when pain is entirely absent, and they are liable as the result of fright alone to become faint and collapsed either during, or soon after the operation As most second year students and nurses know from personal experience it is no slight ordeal to be present at a long operation even

* THE LANCET vol. I 1902, p 1098

when the subject is someone else How much more difficult when the subject is oneself! As Dr Crile has pointed out, a considerable degree of shock may occur from mental anxiety alone, and it is our duty to protect the patient from this as far as possible

Dr Ferguson is alarmed at the possibility of the patient's struggling during an abdominal operation, but this should never occur with gas and oxygen if a good anaesthetist is available, and I personally have had no experience of it The method is, of course still rather new to many anaesthetists, but I feel confident that great improvements in the production of analgesia with gas and oxygen will occur as the result of increased experience with the method In America gas and oxygen as a general anaesthetic is being extensively used and is increasing in popularity, and I feel certain that the same will occur in this country, especially in London, where specialism in the administration of anaesthetics has reached its greatest development

I am glad that Dr Ferguson has drawn attention to the possible danger from chloroform and adrenalin in association I have personally never seen any bad results from the combination, but this is probably because I have used only very dilute solutions of adrenalin and very small quantities of CHOI. I believe, however, that Dr Ferguson is correct and that CHOI should not be given when adrenalin is to be used, as there have been, to my knowledge, one or two deaths which might be attributed to this cause

I am, Sir, yours faithfully,

London July 26th 1916 P LOCKHART MUMMERY, F R O S

DIGITALIS IN AORTIC INCOMPETENCE

To the Editor of THE LANCET

SIR,—Dr Seymour Taylor's article on the above subject in your issue of July 15th prompts me to record the following case of aortic regurgitation treated with tincture of digitalis

A man, about 40 years old, was admitted to hospital on account of dyspnoea and oedema of the legs This condition was due to morbus cordis, and the presence of aortic regurgitation was evident by the usual signs There was evidence of the disease being syphilitic He was put to bed on a restricted diet Some inconsiderable improvement followed Digitalis was given with caution Very definite improvement followed its use This observation was controlled by a careful record of the daily output of urine The following figures were obtained —

Successive periods	Duration in days	Daily amount digitalis given in minims	Daily average excretion of urine
1	8	None	740 c c
2	10	15	980 "
3	6	None	660 "
4	9	22½	1050 "
5	12	22½	1070 "

The effect of the drug on the output of urine was apparent 48 hours after its first administration, and the above periods are taken accordingly

This case illustrates one of the events which may follow the administration of digitalis and it is little more trouble to record than the pulse rate When the case presents definite clinical evidence such as this, of the immediate value of digitalis in aortic incompetence one awaits comprehensive statistics, proving its effect in shortening life, before passing adverse judgment on its value

I am, Sir, yours faithfully,

July 15th 1916

GEOFFREY EVANS,
Temporary Surgeon R.N.

MEDICAL ELECTRICITY DIRECT FROM THE MAIN

To the Editor of THE LANCET

SIR,—In THE LANCET of June 10th, p 1176, a device is described for safely utilising the current from the main for medical purposes by interposing a water resistance It claims to be something new, but is not water not only one of the best, but one of the oldest forms of resistance for galvanism? It has always been used by electrical engineers, and Professor Leduc—in whose laboratories I first saw it—has always worked very largely with it. The experiments in his book (which was published many years ago and which is now the classic on ionic medication) were worked out entirely with water resistances Since the

beginning of the war he has been supervising the electrical work in the 100 hospitals of the Loire military district, and the object of this note is to mention his method, because it is different from British methods.

The apparatus in his research laboratory cost him, as he said, "nothing." Anyone who happens to have by them a glass bowl, some bits of carbon and of wire, a lamp, and a spare milliamperemeter, can make one for the same, by arranging them thus—

The current from the main (C) is taken through a lamp (L) for safety—or 2 lamps. Then to the cylindrical bowl of water (about 6-8 inches x 10-18 inches) and led to 2 carbons A A' which are on a movable wooden rod. At the position in the diagram nothing passes to the patient—but as A A' is moved round towards carbons B B' (which are fixed immovable to the sides of the bowl) the resistance is of course, diminished, and the current may thus be regulated for the patient (P), the quantity being read off on the milliamperemeter (M).

As there are so many thousands of cases now needing ionic medication it is an advantage to be able to give multiple doses simultaneously. In the Loire district it is a favourite plan to have four patients seated or reclining round a table about 4 feet square, for which some wounded carpenter has made a double top, with a space of about 7 or 8 inches in between. Four glass bowls of similar depth are set upon the lower shelf. Four circles are cut out of the upper shelf over them. These act as lids, and also can be twisted round to carry the movable carbons. The current enters the under shelf, and as nearly all war wounds do better with a current that is interrupted, it is passed through a metronome which is fixed on the middle of the top shelf. From here it is divided up and passes to the four separate resistances for the four separate patients.

As a practising electrician who has for the past 14 years treated all wounds (excepting those of viscera) from the earliest possible moment after infliction with static and galvanic electricity, I would consider some such apparatus as the above one of the absolute essentials in the best treatment of any wound.

I am, Sir, yours faithfully,

London July 10th 1916

ETTIE SATYER

MOUTH HYGIENE IN THE ARMY

To the Editor of THE LANCET

SIR,—During the month of February, 1916 I kept a careful record of the condition of the teeth and gums of nearly all the cases admitted into my field ambulance. Those cases, of which no record was kept, were either severely wounded or cases which were rapidly evacuated to the casualty clearing station, owing to their serious condition. This meant that those cases whose mouths and teeth were possibly in a bad condition due to serious illness were eliminated from any calculation. The following is the result of the notes which I kept—

- | | |
|---|-----|
| (a) Number of men admitted whose teeth showed no signs of having been cleaned | 279 |
| (b) Number of men admitted with illness which might have been either caused or aggravated by the very foul and septic condition of their teeth and gums | 65 |
| (c) Number of men admitted whose teeth showed signs of being brushed fairly regularly | 76 |
| (d) Number of cases of which no record of the condition of teeth was made | 61 |

For the first half of this month, when the above records were taken, the troops were out of action, in rest well behind the firing line, and were where they had ample supplies of water. For the latter half of the month the division was in action, where possibly water was not so plentiful, but the records for the two periods show a smaller number of cases admitted under (b) heading during

the latter period, when they were in action, and the supply of water was less plentiful. So 66 cases came into one field ambulance with symptoms which, in the opinion of the medical officers in charge of the cases, and in my opinion, were due to the neglected state of their teeth. If to avoid the risk of overstating the case we say that only in 50 of these cases was the condition due to the foul neglected state of their teeth and gums, it can be estimated that 4,200 thousands every month are admitted into field ambulances with symptoms due to neglect of mouth hygiene.

The R.A.M.C. has done wonders in this war in keeping down the admission rate of serious diseases, and even a liberal number of dentists are being provided to look after the men's teeth, but it appears to me that the subject has to a large extent been overlooked, possibly because at first sight it may not seem of great importance, and secondly because, no doubt, it is not a congenial task for regimental officers to examine their men's teeth, but in my opinion they should have the necessity for doing this pointed out to them in the strongest possible manner, and neglect should be visited with serious penalties.

The above figures would be more strikingly in favour of my argument but for the fact that I was instrumental in having the following order published in the 19th Division Routine Orders on Feb. 3rd, 1916—

D.R.O. 107 3rd February 1916. Discipline.

A large amount of the sickness in the Division is due to the fact that the cleanliness of the teeth is very largely neglected, resulting in such ailments as dyspepsia, gastritis, rheumatism, general debility and even symptoms resembling influenza. Commanding officers and especially company officers should see that every man is in possession of a tooth brush and that this is used for its legitimate purpose, and C.O.s 1/6 units should impress upon all concerned the importance of the hygiene of the mouth.

I am, Sir, yours faithfully,

G. J. STONEY ARCHER,
Lieutenant-Colonel R.A.M.C.

WALKER-GORDON LABORATORIES A TEMPORARY SUSPENSION OF WORK

To the Editor of THE LANCET

SIR,—Will you permit us to inform the members of the medical profession that owing to the conditions now existing we find it no longer possible to carry out the methods and arrangements which constitute the essence of this business, and we are obliged, therefore, with the greatest regret, to close down until the termination of the war.

We are, Sir, yours faithfully,

WALKER GORDON LABORATORIES, LIMITED
Weymouth street, July 31st, 1916

SOCIETY FOR THE STATE REGISTRATION OF TRAINED NURSES—At the last meeting of the executive committee of this society Mrs Bedford Fenwick, the President, proposed a motion recording the profound sorrow of the society at the irreparable loss sustained by the death on active service in Mesopotamia of its distinguished Vice President, Colonel Sir Victor Horsley, C.B., F.R.C.S., I.R.S., LL.D. The motion was carried in silence, the members standing.

DONATIONS AND BEQUESTS—By the will of the late Mr J. Plews the Merthyr Tydfil General Hospital will receive £500.—The late Mr Salomon Stern has bequeathed £500 to the London Hospital, King Edward's Hospital Fund.—Under the will of the late Sir Michael Barker Bart., bequests of £6000 have been left to the Kirkcaldy Hospital £2000 equally between the Cupar Victoria Nursing Association, the Ladybank Victoria Nursing Association, the Letham Nursing Association, and the assistance of nursing in the villages of Springfield and Pittlesie, £1000 to the District Victoria Nurses Endowment Fund, £2500 for the endowment fund of Kirkcaldy Victoria Nurses, and £500 to the Cupar Cottage Hospital for the endowment fund.—Subject to her sister's life interest the late Miss Mary Hadler of Smethwick, has bequeathed £500 each to the General Hospital, Birmingham and the Queen's Hospital Birmingham the Birmingham and Midland Free Hospital for Sick Children, the Birmingham and Midland Eye Hospital, the Women, the Birmingham and Midland Eye Hospital, the Birmingham Living in Charity, the Birmingham Midland Ear and Throat Hospital, the Midland County Home for Incumbles, Leamington, and the Society for the Prevention of Cruelty to Children and £200 each to the Institute for the Deaf and Dumb Children Birmingham and the General Institute for the Blind, Birmingham.

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Captain A. M. Thomson, R.A.M.C., attached to the Royal Sussex Regiment, was educated at the Royal University, Belfast, qualifying in 1909. He was in practice at Belfast prior to joining the R.A.M.C., shortly after the outbreak of war.

Died

Lieutenant-Colonel A. H. Lister, C.M.G., R.A.M.C., 19th General Hospital, Alexandria, was educated at Marlborough and Cambridge and qualified at Aberdeen University. He was a specialist in tuberculosis, practising in Aberdeen in which city he held many appointments.

Captain H. R. Robertson, R.A.M.C., attached to the Essex Yeomanry, graduated M.D. Dublin in 1895, and was in practice at Tientsin, China, for some years. He joined the R.A.M.C. soon after the outbreak of war.

Captain W. Hillbrook, British East African Expeditionary Force, was educated at Cambridge and at St. George's Hospital, London, and qualified in 1915. He proceeded to Uganda, taking a post at the Mengo Hospital, and subsequently accepted a commission in the Expeditionary Force.

Wounded

Captain J. M. Stenhouse, R.A.M.C., attached to the Royal Field Artillery.

Captain J. Granger, South African Medical Corps.

Captain S. Liebson, South African Medical Corps.

Captain T. Sheehan, R.A.M.C.

Captain J. D. Wilkinson, R.A.M.C., attached to the Royal Field Artillery.

Captain W. J. Henry, R.A.M.C., attached to the Wilts Regiment.

Captain A. T. Nankivell, R.A.M.C., attached to the Argyll and Sutherland Highlanders.

Lieutenant E. F. Nixon, R.A.M.C.

Captain W. D. Chambers, R.A.M.C., attached to the Gloucester Regiment.

Captain A. Grant, R.A.M.C., attached to the Royal Fusiliers.

Lieutenant H. B. Maxwell, R.A.M.C., attached to the London Regiment.

Captain A. F. Palmer, R.A.M.C., attached to the Royal Field Artillery.

Lieutenant A. L. Anderson, R.A.M.C., attached to the Royal Warwick Regiment.

Captain R. Lawson, R.A.M.C.

Captain R. H. Lucas, R.A.M.C., attached to the Royal Fusiliers.

Captain J. A. Macleod, R.A.M.C.

Captain J. H. H. Pearson, R.A.M.C., attached to the Royal Lancaster Regiment.

Captain D. Pottinger, R.A.M.C.

Captain S. Brown, R.A.M.C., attached to the Royal Field Artillery.

Captain H. E. O'Brien, R.A.M.C.

Captain R. Park, R.A.M.C., attached to the Royal Field Artillery.

Previously reported Believed to have been taken Prisoners at Kut-el-Amara, now reported Prisoners.

Captain L. A. P. Anderson, I.M.S.

Major C. H. Barber, I.M.S.

Colonel P. Behr, C.B., I.M.S.

Captain H. H. King, I.M.S.

Believed taken Prisoner at Kut-el-Amara.

Major S. Bose, I.M.S.

DEATHS AMONG THE SONS OF MEDICAL MEN

The following sons of medical men must be added to our lists of those who have fallen during the war —

Second Lieutenant M. Herward, Dorset Regiment, son of Dr. H. Herward, of Crodon.

Private R. D. Johnson, Somerset Light Infantry, third son of the late Dr. P. P. Johnson, of Yatton, Somerset.

Lieutenant W. Hall, South Staffordshire Regiment, son of Dr. W. Hall, of Hodnet, Salop.

Lieutenant J. L. Whitty, Leinster Regiment, attached to the Royal Flying Corps, third son of Lieutenant Colonel M. J. Whitty, R.A.M.C.

Second Lieutenant A. J. Bullivant, Sherwood Foresters, younger son of the late Dr. S. Bullivant, of Mansfield, Notts.

Second Lieutenant A. G. Chambers, Middlesex Regiment, fourth son of the late Dr. A. B. Chambers, of Long Eaton, Notts.

Second Lieutenant W. K. Sanderson, Border Regiment, only surviving son of the late Dr. T. D. Sanderson, of Fairfield, Penrith.

Captain W. T. V. Gripper, East Surrey Regiment, eldest son of Dr. W. Gripper, of Wallington, Surrey.

Lieutenant and Assistant Adjutant H. B. Murray, Argyll and Sutherland Highlanders, fifth son of the late Dr. W. B. Murray, of Tenbury, Worcestershire.

Lieutenant H. B. Fisher, Northumberland Fusiliers, younger son of Dr. G. E. Fisher, of Skipton, Yorks.

Captain J. A. Ritson, South Lancashire Regiment, only child of Major R. Ritson, R.A.M.C., of Reading.

Captain G. B. Donaldson, Royal Warwickshire Regiment, only child of the late Dr. E. Donaldson, of Londonderry.

Captain W. F. G. Willes, Dorsetshire Regiment, eldest son of Mr. W. Willes, M.R.C.S., &c., of Bournemouth.

Second Lieutenant C. O'C. McSwiny, King's Shropshire Light Infantry, younger son of Dr. M. O'C. Swiny, of Okehampton, Devon.

Second Lieutenant E. R. Ratcliff, Gairdard, Duke of Cornwall's Light Infantry, only surviving son of Dr. J. Ratcliff-Gairdard, of Burkenhead.

Second Lieutenant N. Compton Burnett, Leicestershire Regiment, son of the late Dr. J. Compton Burnett, of Finsbury, London.

Lieutenant and Adjutant N. C. Clery, Royal Field Artillery, younger son of Surgeon General Clery, C.B., of Blackheath, Surrey.

Lieutenant C. P. Caesar, Shropshire Light Infantry, son of the late Dr. C. A. Caesar, of Hatfield, Herts.

Lieutenant A. C. Holland, Bedfordshire Regiment, youngest son of Dr. J. F. R. Holland, H.B.M. Consul, St. Moritz, Switzerland.

Captain W. V. T. Gripper, East Surrey Regiment, eldest son of Dr. W. Gripper, Wallington, Surrey.

Lieutenant A. W. Sewill, West Yorks Regiment, elder twin son of Mr. H. E. Sewill, M.R.C.S., &c., of Earlswood Common, Redhill, Surrey.

OBITUARY OF THE WAR

ARTHUR HUGH LISTER, B.A. CAMB. M.D. CM. ABERD.,
LIEUTENANT-COLONEL, ROYAL ARMY MEDICAL CORPS.

Lieutenant-Colonel A. H. Lister, who died on July 17th at the age of 51, was the son of the late Arthur Lister, F.R.S., and a nephew of the late Lord Lister. He was educated at Marlborough and Trinity College, Cambridge, and graduated in medicine at Aberdeen University in 1895, taking his M.D. degree with honours in 1904. After a period of post-graduate study in London during which he was house physician at the Middlesex Hospital, he settled in Aberdeen where in addition to the claims of a considerable consulting practice, he filled with distinction a number of important posts. He was at various times honorary physician to the tuberculosis wards at the Aberdeen City Hospital, medical officer to the Morningfield Hospital for Incurables, and honorary medical referee to the Newhills Sanatorium. His chief work, however, was at the Aberdeen Royal Infirmary, to which he was attached for many years, being at the time of his death full physician and lecturer on clinical medicine at Aberdeen University. In the latter capacity his power and lucidity as a teacher were much appreciated by the

students Shortly after the outbreak of war he went to France to take charge of the medical side of the hospital unit at Wimereux, and later, in April, 1915, he was given the medical charge of the 19th General Hospital at Alexandria, where he devoted himself to the duties of his position with characteristic energy and enthusiasm In recognition of his services he obtained a short time before his death the distinction of O M G The strain of a second summer's work under the trying conditions of Alexandria proved too much for his health and led to the recurrence of an old pulmonary tuberculous lesion, for which he had undergone a long course of treatment with satisfactory result a few years previously The disease made rapid progress and he died at sea while on the voyage home

One of his contemporaries writes of him "Lister was a physician of unusual ability, a good teacher, and a man of singular charm and nobility of character To his patients he was as much friend as physician He regarded his life and energy as a trust to be spent, heedless of himself, in the interests of others, and to the strain involved in his untiring devotion to this ideal is largely to be attributed his premature death" The truth of this verdict will be recognised by all who knew Colonel Lister His loss leaves the medical profession the poorer and a gap hard to fill in the wide circle of his friends Colonel Lister married in 1896 Sybil, daughter of the late Sir Reginald Palgrave, K O B, Clerk to the House of Commons, who survives him, with a family of seven children

EDWARD AUGUSTINE BELL, M B, B S LOND,

CAPTAIN, ROYAL ARMY MEDICAL CORPS

Captain E A Bell, who was accidentally drowned whilst on active service in France on July 11th at the age of 38, was the fourth son of the late William Bell, M R O S, J P, of New Brighton, Cheshire He was educated at Rossall and Birkenhead Schools Entering King's College, London, with a scholarship he gained both junior and senior scholarships, the Tanner prize for obstetrics, and was prosector at the Royal College of Surgeons Captain Bell qualified M R O S Eng in 1902, taking the M B Lond in the same year and the B S in 1903 After holding the post of house surgeon at the Royal Free Hospital he settled in New Brighton as assistant, and subsequently partner to his father, Mr William Bell, at whose death in April, 1915, he succeeded to the whole practice He was honorary senior surgeon to the Wallasey Cottage Hospital, honorary surgeon to the New Brighton Convalescent Home and Wallasey Ladies' Charity, surgeon to the Home for Aged Mariners, Egremont, as well as Admiralty surgeon and agent In November, 1915, he was appointed surgeon to the British Hos-

pital at Wimereux, and later was attached as surgeon specialist to the Anglo American Hospital, where he remained until his death On June 18th he was gazetted as temporary Honorary Captain in the Royal Army Medical Corps

One of his colleagues in France writes of him "Bell worked for the patients day and night and was loved by them all He did 46 operations the day before he died and was quite exhausted by it His was a fine nature strong and true and

capable, tender and untiring with the men, loyal to all our interests He died in the midst of his work and at the height of his usefulness"

In his leisure time Captain Bell was a keen athlete, playing for his hospital in the inter-hospital cup-ties and as a tennis player represented Cheshire and won prizes in many open tournaments He married in 1904 the younger daughter of Canon Cogswell, D D rector of Wallasey, and leaves a widow and two children

ROBERT WILLIAMS MICHELL, M A, M D, B O CANTAB F R O S Eng

CAPTAIN ROYAL ARMY MEDICAL CORPS

Captain R W Michell, who died in London on July 19th of wounds received in action in France at the age of 56 years was the eldest son of Mr R F Michell, of Truro, and came from an old Cornish family His medical education was begun at Cambridge and continued at St Bartholomew's Hospital He was a devoted member of Caius where he had captained the college boat and graduated in medicine in the University taking the F R O S Eng a little later Among the several

appointments he held was a demonstratorship in anatomy in the University and the experience thus gained served him in good stead He remained in Cambridge, where his practice was chiefly among the undergraduates and younger graduates of the University His keenness and energy, with enthusiasm for the young life of the University, his desire to do his best, and give the most valuable of his great store of experience to those who needed it among active undergraduates, was a striking characteristic of the man He entered into the conditions liable to arise from undue exercise, with care, skill, and a knowledge that was considerable and of the greatest value Heart strain was one of the conditions he particularly laboured to understand, so that he might guide aright the natural bent of the keen sporting man In this subject he had already won the distinction of being an authority of no mean order He was one of the first practitioners to make use of the electro cardiograph as a regular routine in his clinical studies and practice

Sir Clifford Allbutt writes of him "Michell was so impressed by the complexity and obscurity of cardiac problems that it was difficult to persuade him to publish any of his researches, and I fear for the same reason that we shall find little left for publication For Allbutt and Rolleston's 'System of Medicine' Michell had contributed a few short paragraphs, and I know he had collected some further notes for a separate edition of my article in that System which probably now will not see the light Nevertheless, in one way or another Michell's researches on cardiac disorders became well known both to the profession and to the public, so that his opinion was sought in many responsible cases Sometimes he attended scientific discussions on cardiac questions but the loose general statements which too often find their way into such conversations made him angry Likewise he was liable to be moved to wrath if on one of his cases another opinion were given on half the consideration and often on less experience than he had given to it On such occasions, like Lawrence Boythorne, he would express himself with as much vigour and point and with as little malice"

Another friend writes of him "Apart from his medical labours, it may truly be said that no one ever succeeded so much as Michell in winning the confidence of young men in impressing upon them the genuineness of his advice and of the solicitude he ever exercised for the benefit of others"

Captain Michell served in the Boer War, and as soon as the present war broke out he was keen to serve and do his share No one can forget the series of brave acts which he performed just before he was himself wounded and for these he has been recommended for the Victoria Cross He leaves a widow and a boy of eight

LIFE SAVING MEDALS OF THE ORDER OF ST JOHN—At a recent chapter general of the Order of St John's life saving medals were presented to Major Harold Fennell Priestley, C M G, R A M C, and Captain Alan Canham Vidal, D S O, R A M C in recognition of the gallantry displayed by them at the Wittenberg Camp Captain James La Fayette Lauder, D S O, R A M C was presented by military duties abroad from attending to receive a similar medal

THE HONOURS LIST

The King has conferred the honours mentioned upon the following medical officers in recognition of their gallantry and devotion to duty in the field —

Distinguished Service Order

Temporary Captain W Dawson, R A M C

For conspicuous gallantry and devotion to duty when dressing the wounded and directing stretcher bearers in the firing line. At dusk he searched the front himself under heavy rifle fire till every wounded man had been removed.

Captain P F Gov, I M S

For conspicuous gallantry and devotion to duty on several occasions notably when he took one end of a stretcher after three bearers had been hit, and brought in a wounded officer.

Captain W A Miller R A M C, Special Reserve, attached 22nd (S) Battalion, Royal Fusiliers

For conspicuous gallantry and devotion to duty. Captain Miller followed the front line of our attack over ground swept by shell machine gun and rifle fire. He searched in every direction for wounded and gained valuable information regarding the situation. This he at once communicated and at once continued his search for wounded. This officer has on previous occasions shown distinguished gallantry.

Temporary Lieutenant L M Rowlette, R A M C, attached 1st Battalion Welsh Guards

For conspicuous gallantry and devotion to duty. During a heavy bombardment he crawled across the open for a considerable distance to attend to two wounded men. Later he went out again and although twice wounded dressed the wounds of seven wounded men and tended them till he had to be himself removed.

Military Cross

Temporary Captain N Black, R A M C, attached 11th Battalion Argyll and Sutherland Highlanders

For conspicuous gallantry and devotion to duty. After a shell had blown in his dressing station and he had been out bruised and much shaken he rested ten minutes and then although still suffering went out under heavy fire to attend to a wounded officer in the support trenches.

Temporary Captain C M Brophy, R A M C, attached 18th Battalion London Regiment (T F)

For conspicuous gallantry in leading bearer squads under heavy shell fire. To succour wounded he maintained communication with the regimental aid posts and so enabled a large number of wounded to be rapidly brought back.

Captain J A Cullum, Canadian A M C, attached 28th Canadian Infantry Battalion

For conspicuous gallantry. During a very heavy bombardment by the enemy he saw a sergeant buried in his dug-out by a direct hit. He at once went out and at great personal risk succeeded in rescuing the sergeant and taking him to the dressing station. On many previous occasions he had displayed great coolness under fire.

Captain H E Cumming, No 4 Field Ambulance, Canadian A M C

For conspicuous gallantry and devotion to duty when carrying out his duties during the heavy bombardment of a battery of artillery by the enemy.

Captain H F L Hugo, R A M C (T F), attached Royal 1st Devon Yeomanry

For conspicuous gallantry notably when he went to the front line trench under heavy shell fire and, after his orderly had been dangerously wounded and half buried stood by and supported him till help arrived. Two officers and two men were killed within a few yards of him. On another occasion he brought in a wounded lieutenant across 200 yards of open ground under sniping fire.

Captain A E Ironside 4th London Field Ambulance, R A M C (T F)

For conspicuous gallantry and devotion to duty when in charge of bearer subdivisions. He organised the work most efficiently and assisted in the dressing of wounded under heavy shell fire.

Temporary Captain F P Joscelyne, R A M C, attached 2nd Battalion, Royal Sussex Regiment

For constant gallantry and devotion to duty. He has shown complete disregard of personal danger on all occasions and has frequently carried out his duties under heavy fire. On one occasion a bullet from a machine-gun passed through his coat but he showed complete indifference.

Captain N L Joynt R A M C, Special Reserve, attached 176th Tunnelling Company, R E

For conspicuous gallantry. When the enemy exploded a camouflaged which choked a mine gallery with foul gas he at once organised rescue work going down himself repeatedly with rescue apparatus. Through his cool bravery he succeeded in personally rescuing two men and ensured the quick recovery of others.

Captain R L Lloyd, South African Medical Corps

For conspicuous gallantry and devotion to duty when tending the wounded under machine-gun fire.

Temporary Captain J M MacKenzie R A M C, attached 6th Battalion Northumberland Fusiliers (T F)

For conspicuous gallantry and devotion to duty. Though wounded in the foot and arm he refused to go to hospital and four days later during a heavy hostile bombardment, he went up through the enemy artillery barrage and tended many wounded men though in considerable pain himself.

Captain W H Riddell, I M S

For conspicuous gallantry and devotion to duty on several occasions when tending the wounded under heavy fire.

Captain R A Stewart, R A M C, Special Reserve, attached 2nd Battalion Border Regiment

For conspicuous gallantry. During the attack on an enemy position he went forward and established an aid post in a mine crater, and tended many wounded under heavy shell fire. His coolness and disregard of personal safety gave great confidence to those round him.

Captain G W Treleaven, Canadian Army Medical Corps

For conspicuous gallantry and devotion to duty when attending wounded men under heavy shell fire and getting them into safety.

Temporary Lieutenant J R Irwin, R A M C, attached 2nd Battalion, Worcestershire Regiment

For conspicuous gallantry. When the enemy exploded a mine damaging our galleries he immediately descended into the gallery and at great risk owing to foul fumes treated a man and enabled him to be brought up alive.

Temporary Lieutenant C C Okell, No 6 Field Ambulance, R A M C

For gallant conduct in frequently leading a bearer division over shell swept ground. His bravery and good example greatly assisted in the removal of all our wounded.

Temporary Lieutenant Peter Mortimer Turnbull, R A M C, attached 2nd Battalion, Royal West Surrey Regiment

For conspicuous gallantry when tending the wounded under heavy fire on several successive days.

With regard to the following, the specific acts for which the Military Cross has been granted will be officially announced later —

Temporary Captain H A Pallant, R A M C, attached 1st Battalion North Lancashire Regiment

Temporary Lieutenant F R Hassard, R A M C, 102nd Field Ambulance

Temporary Lieutenant V F Stock, R A M C, 104th Field Ambulance

Temporary Lieutenant G B Wiswall, R A M C, 103rd Field Ambulance

THE NEED FOR OFFICERS IN THE ROYAL ARMY MEDICAL CORPS

At the annual Representative Meeting of the British Medical Association, reference was made by Dr T Jenner Verrall, chairman of the Central Medical War Committee, to a strong feeling that had been expressed in certain quarters on the subject of the withdrawal by the War Office of the privilege of resigning commissions in the Royal Army Medical Corps after 12 months' service. Dr Verrall stated that the matter had been taken up with the War Office very thoroughly at the first moment when the idea had been mooted of any such alteration being made in the terms of service and the following communication on the subject was made to the meeting in the form of a letter from Sir Alfred Keogh to Dr Verrall —

July 29th, 1916

DEAR DR VERRALL,—From certain things that have come to my knowledge, I think that a considerable amount of misunderstanding must be prevalent in regard to the temporary order recently issued concerning the privilege accorded to doctors early in this war of resigning their commissions after 12 months' service.

All that has been done in this connexion is that a communication was sent a few weeks ago to certain commands instructing them that, for the present, any doctors (under 41 years of age) whose 12 months' term was shortly expiring, and who desired to resign at the end of it, were to be informed that the date of resigning must, in the present serious stress, be postponed for a time until the number of doctors available for taking R A M C commissions should have been increased to a figure more nearly meeting our very grave requirements.

The step was taken, I need hardly say, with the very greatest reluctance, but it was imperative by reason of our knowledge of the very heavy needs of the forces, as now visible to everyone, in the recent and present military increased needs taken in conjunction with the unfortunately inadequate number of doctors forthcoming for some months in the R A M C during the important months of April, May, and June.

And, lastly, it was a strictly temporary order, to be rescinded the moment the number of doctors produced by your Committee becomes sufficient to justify this.

In particular, it should be noted that the step thus taken (as has been alleged) but only a very small number of doctors. I should tell you, by the way, that the vast majority (over 90 per cent I believe) of the doctors who have taken commissions in the Royal Army Medical Corps since

the privilege of 12 months' service was accorded, have exercised their option in the direction of staying on in the service, and not resigning at the end of their year.

And the order affects only those of the men holding commissions at the time it was issued whose year happened to be shortly expiring and who were not proposing to stay on. Furthermore, it was restricted to such of that limited number as came within the compulsory provisions of the Military Service Acts, the passing of which has, of course, fundamentally altered the position of all the men under 41 as compared with what it was when they were given their Royal Army Medical Corps commissions in July, 1915.

Thus you see the number of doctors affected (and this only temporarily) is extremely small. In particular, it must be noted (in view of the misapprehensions so widely circulated) that doctors who have taken commissions at any time during this year or the latter part of last year are in no way affected by the order. All these men have come in with their option of resigning unaltered, and, if the number of doctors forthcoming in future is sufficient for our needs, there is no reason to suppose that the option in their cases will ever be altered or need to be withdrawn.

There is, therefore, "no such breach of faith" towards the whole profession (and in particular towards the 250 men recently called to commissions) as has been alleged in certain quarters. There has been simply a strictly temporary administrative step taken, in relation to a very limited number of medical men (each of them liable now to compulsory service), under compelling military necessities of the first importance for this country, a temporary change which will be resinded the moment the overmastering needs of the situation have been adequately provided for—in fact, I hope in a very few weeks' time—a step, therefore, in which, when it is properly understood, the whole profession and the public and Parliament will, I am certain, concur, so much so that, I am sure, had we failed to take it, in the circumstances we should have been considered guilty of a grave dereliction of public duty, and the profession, had it failed to respond, of a lack of public spirit of which I, for one, do not believe it to be capable.

I write you this letter because I thought it would be well if you would take the opportunity of your annual meeting this week to make this whole matter clear and to dissipate the prevailing misapprehensions on the subject.

I am, yours very truly
A KEUGH

"FEES FOR EXAMINING RECRUITS"

We have received from Dr. A. G. Bateman, the general secretary of the Medical Defence Union, a copy of a letter addressed to him from the War Office which satisfactorily terminates a correspondence of some duration, respecting the claims of medical practitioners on account of fees for medical inspection of recruits in certain districts. These claims were disputed owing to the failure of a memorandum issued by the War Office in February, 1915, limiting payment to an amount below the usual scale of peace time, to reach some recruiting centres in time. The letter is as follows—

War Office London S.W., 29th July, 1916

SIR,—With reference to previous correspondence on the subject of claims of medical practitioners for the examination of recruits, I am directed to acquaint you that it has now been decided to settle the disputed claims referred to by the payment of 2s 6d a head up to 16 recruits examined and 2s for each recruit examined in excess of 16 in any one day. I am to express the hope that this arrangement may be found satisfactory.

I am, Sir, your obedient servant,

(Signed) R. PATERSON
(For the Assistant Financial Secretary)

Dr. A. G. Bateman, General Secretary
Medical Defence Union, 4 Trafalgar-square W.C.

USE OF MORPHIA FOR WOUNDED MEN IN THE FIELD

The administration of an opiate to the wounded man pending surgical treatment has long been recognised as a legitimate practice. Erichsen in his "Science and Art of Surgery" (tenth edition vol. ii) recommended that shock and pain should be counteracted by a little brandy and water and opium, and plenty of cold water to relieve thirst. Sir Thomas Longmore considered that morphia (especially in hypodermic injection) might be used with much advantage ("Gunshot Injuries," 1877) the value of the remedy consisting not merely in the reduction of local pain and in soothing spasm, but principally in its influence over the mental irritation and constitutional disturbance which result from them. On the other hand, no mention of morphia

is made by Surgeon General Stevenson ("Wounds in War," third edition), who recommends hypodermic injections of strychnia for shock, together with the administration of food and stimulants, such as meat extract and a little alcohol. In the "Manual of Training" for the use of the Royal Army Medical Corps it is clearly stated that during an engagement the immediate treatment of wounded by the regimental medical detachments includes, *inter alia*, the relief of pain for which a hypodermic tabloid of morphia may be placed under the tongue. It is, however, laid down that opiate should only be used under the orders of a medical officer. The tablets formerly contained one sixth of a grain of hydrochloride of morphia, they now contain, we believe, one quarter of a grain of morphia tartrate. The liability to abuse is obvious, but we are inclined to the belief that the risk of its occurrence is not great, and that the benefit resulting from immediate alleviation of suffering by a small dose of morphia placed under the tongue, as suggested, would outweigh the hypothetical disadvantages. The magnitude of the operations in the present conflict the enormous numbers engaged, and the time that must inevitably elapse in many cases before a medical officer can attend personally to the wounded man, combine to suggest some relaxation of the wholesome rule restricting the use of morphia. Doubtless this already occurs in practice. We have learned that the private soldier can be trusted to a greater extent than would have been thought advisable 20 or even 10 years ago.

THE EDUCATIONAL BOOK SCHEME AND BRITISH PRISONERS OF WAR

The recent revolutions respecting the condition and needs, physical and mental, of some of the British prisoners of war interned abroad, coupled with the recently imposed restrictions on the transmission, by private individuals, of any printed matter to enemy or neutral countries, make it more important than ever that friends and correspondents of our interned men when writing to them should acquaint them with the existence of the Educational Book Scheme. Under this scheme a prisoner can obtain free of charge and carriage paid, good books of an educational character (not fiction or light literature) on almost any subject for reading or private study during his internment by communicating (either directly or through a correspondent) with Mr. A. T. Davies, of the Board of Education, Whitehall, London, S.W. Prisoners are invited to state as precisely as possible on a form (which can be had gratis on application) what kind of books they desire. Offers of suitable books for the Educational Book Scheme will be gladly received by Mr. Davies but they should be accompanied by a submission of the list of books proposed to be contributed.

Medical News.

EXAMINING BOARD OF THE ROYAL COLLEGES OF PHYSICIANS AND SURGEONS OF EDINBURGH AND ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW.—The following are the results of the Triple Qualification Examinations—

FIRST EXAMINATION

William Barton William Campbell, Ronald Gillan Clouston, Jr. & Hayne Crawford Ian Bruce Cummings David Falconer Smith and Jessie Melville Lyell Wright

SECOND EXAMINATION

Apcar Galustian Stuart Douglas M. Ausland, Gordon Patrick Walker and Alexander Watson L.D.S.

THIRD EXAMINATION

Samuel Saxon Barton George Carter Cosser M.A. (with distinction) William Hutchinson Duff Robert Lloyd Jones William (71) Desmond Longford Archibald Buchanan MacDougall L.D.S. Allan Paul M. Leod Cuthbert Gaultier Magee Patrick Algallos O'Brien Archibald Paterson Robb Thomas Talmage Noel F.D.S. (with distinction) and Thomas Robert Wilson

FINAL EXAMINATION (L.R.C.P. & S. Edin., L.R.F.P. & S. Glasg.) Richard Lloyd Jones William Bruce Lawson L.D.S. Michael Campbell Hector Sorabji Dhilliwani Maniketh Vithi Veron William Campbell Borrie John Alexander Murray John Alexander Smith James Young M. Lean Perry Hayes and John Bygott

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—A Committee was held on July 27th, Dr. Percy Kidd the Senior Censor, being in the chair. The following candidates having passed the required examination were admitted Members of the College Richard Alan Rowlands M.B.

and, L.R.C.P., and Gilbert Innes Strachan M.D. Glasgow. Licences to practise physic were granted to 120 candidates who had passed the requisite examinations. In conjunction with the Royal College of Surgeons of England diplomas in Public Health were granted to Reginald E. George Smalbridge Bond M.B., C.M., F.R.C.S. Edin., Abel, Marc Minett M.B. B.S. Lond., and Henry Owen West M.D., B.S. Lond., M.R.C.P. Lond. On the nomination of the President the Council and the Library Committee the following elections were made—

Censor—Dr W. Hale White Dr W. Pasteur Dr S. H. C. Martin
Treasurer—Sir Dyce Duckworth
Executive Registrar—Dr E. Livingstone
Registrar—Dr J. A. Ormerod
Honorary Librarian—Dr Norman Moore
Member of the Library Committee—Dr G. N. Pitt Dr C. Ogle
Dr T. H. A. Chaplin, and **Dr R. O. Moon**.
Governers of the Museum—Dr J. Mitchell Bruce Dr Sir Seymour J. Sharkey Dr F. W. Andrews and Dr W. Hunter
Finance Committee—Dr S. P. Phillips Dr J. Taylor and Dr H. R. Spencer
Examiners—Chemistry, Mr. W. B. Hurler and Mr. T. M. Lowry
 Physics, Dr F. Wack and Mr. A. W. Porter F.R.S. Practical
 Pathology, Dr H. J. Campbell Dr F. L. Golla, Dr R. H. Miller Dr
 W. E. Dixon, F.R.S., and Dr A. J. Clark Physiology, Dr F. A. Bainbridge and Professor W. M. Bayliss F.R.S. Anatomy, Mr. W. Wright
 Medical Anatomy and Principles and Practice of Medicine, Dr A. E. Garrod Dr F. W. Mott Dr A. G. Barr Dr F. J. Wetherell
 Dr F. J. Smith Dr H. G. Turner Dr J. Fawcett Dr A. M. Gossage
 Dr F. J. Poynter and Sir John F. H. Broadbent Midwifery and
 Diseases peculiar to Women, Dr H. Williamson Dr C. H. J. Lockyer
 Dr T. G. Stearns Dr G. B. Smith and Dr J. B. Heiller
Public Health—Part I, Dr W. W. O. Beveridge, D.S.O. Part II,
 Dr S. A. M. Copeman
Tropical Medicine—Bacteriology, Dr J. C. G. Ledingham Diseases
 and Hygiene of the Tropics, Dr F. M. Sandwith.

The following communications were received: 1 From the Secretary of the Royal College of Surgeons of England dated May 12th June 9th and July 14th reporting proceedings of the Council of that College on May 11th June 8th and July 15th respectively. 2 From the Royal Society, dated June 19th enclosing a copy of regulations for the organisation of a Conjoint Board of Scientific Societies concerned and asking the College to nominate representatives upon the Board. The Acting President nominated the President and Dr Henry Head. An offer was received from Mrs. Stratfield to give £10,000 in Consols to be held by the Royal College of Physicians of London and Royal College of Surgeons of England jointly in trust for the promotion of research. The offer was accepted and a letter ordered to be written to Mrs. Stratfield thanking her for her generous gift. Dr T. D. Acland was elected a Representative Governor of the University of Sheffield and Sir George Savage was reappointed a Representative on the Committee of Management of the Chelsea Physic Garden. Reports were received from the Committee of Management recommending that Rugby School be added to the list of institutions recognised by the Examining Board in England for instruction in Chemistry and Physics, and that the State University of Iowa, Iowa City, U.S.A., be added to the list of universities whose graduates in medicine are admissible to the Final Examination of the Conjoint Board. The reports were adopted. After some further formal business the Acting President dissolved the Committee.

ROYAL COLLEGE OF SURGEONS OF ENGLAND—An ordinary meeting of the Council was held on July 27th, Sir Watson Chene the President being in the chair. In accordance with a report from the Court of Examiners it was resolved to issue Diplomas of Membership to 119 successful candidates. It was resolved to issue a Licence in Dental Surgery to a successful candidate. The secretary laid before the Council a balance-sheet and a statement of the receipts and expenditure of the Council. These were approved and adopted and it was resolved to issue them with the annual report of the Council to the meeting of Fellows and Members and also in the calendar. A letter was read from the Assistant Secretary of the Local Government Board forwarding by the direction of the President of the Board copies of the circular and regulations which the Board have issued with regard to the prevention and treatment of venereal diseases. The Licence in Dental Surgery has been conferred upon Geoffrey Walter Allen Guy's Hospital, who has passed the necessary examinations and complied with the by-laws.

CENTRAL MIDWIVES BOARD—Special meetings of the Central Midwives Board were held at Caxton Hall, Westminster on July 26th and 27th with Sir Francis H. Champneys in the chair. A number of midwives were having been brought forward. The midwife neglecting to take and record the pulse and temperature of the patient at each visit as required by Rule E 13 not keeping her register of cases as required by Rule E 23. The midwife did

not give to the Local Supervising Authority every reasonable facility for inspection of her register, of cases, bag of appliances, and place of residence, nor for the investigation of her mode of practice, as required by Rule E 24, she did not keep her bag and appliances in a satisfactory condition within the meaning of Rules E 1 and 2. Having administered to the patient a drug other than a simple aperient the midwife failed to note the fact with the particulars thereof in her register of cases, as required by Rule E 15—the child suffering from inflammation of, and discharge from, the eyes on the fifth day, and continuing so to suffer, she did not explain that the case was one in which the attendance of a registered medical practitioner was required, as prescribed by Rule E 20 (5). The midwife not being scrupulously clean in every way, as required by Rule E 1, when attending patients she did not wear a clean dress of washable material, as required by Rule E 1. A child suffering from hemorrhage of the cord, the midwife did not until 26 hours after the birth explain that the case was one in which the attendance of a registered medical practitioner was required as prescribed by Rule E 20 (5), when advising medical help as aforesaid she did not hand to the husband or the nearest relative or friend present the form of sending for medical help, properly filled up and signed by her in order that this might be immediately forwarded to the medical practitioner, as required by Rule E 19 she neglected to give to the registered medical practitioner who saw the child any information as to the hemorrhage and medical aid having been sought for the child as aforesaid she neglected to notify the Local Supervising Authority thereof, as required by Rule E 21 (1) (a).

A letter was considered from the Sister of the Maternity Ward at the London Hospital inquiring whether attendance by a pupil midwife at a course of 15 lectures delivered by the obstetric physician and 15 delivered by the senior resident accoucheur would be deemed a compliance with Rule C 1 (1) (c) requiring *inter alia* attendance at a course of not less than 20 lectures delivered by a registered medical practitioner recognised by the Board as a lecturer. The Board directed that the reply be that the Board is not prepared to adopt the suggestion of the Sister of the Maternity Ward of the London Hospital according to Rule C 1 (1) (c) the approved lecturer is bound to deliver not less than 20 lectures. Any additional instruction by another person would doubtless be advantageous.

MEMORIAL TO THE LATE LIEUTENANT-COLONEL EDELL R.A.M.C.—On Sunday last a moral memorial to the late Lieutenant Colonel George Alfred Edsell, R.A.M.C., was unveiled by Canon Potter vicar of St. Mark's Church, Surbiton. Lieutenant Colonel Edsell had been in command of the 3rd Home Counties Field Ambulance and died at his residence at Surbiton on August 15th 1915 aged 56 years after being invalided home on account of a severe attack of pneumonia. The tablet which has been placed on the north wall of the church was subscribed by his patients and friends in the Surbiton district.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS

Medical Arrangements in Mesopotamia

WHEN the Bill setting up Statutory Commissions to inquire into the conduct of the operations of war in the Dardanelles and in Mesopotamia was passing through the House of Commons several amendments were made in it. The House decided to add to the Dardanelles Commissioners Mr. W. Roach M.P., and to the Mesopotamia Commissioners Commander J. C. Wedgwood, M.P., and also in each case a naval and a military officer.

On the motion of Mr. DILLOV an important provision was inserted in the clause dealing with the reports of the Commissions. It was to the effect that "the Commissioners shall proceed with all possible expedition to inquire with regard to the provision for the sick and wounded, and shall report the results of their inquiry on this matter before proceeding with the rest of their inquiry." This provision was accepted without very much discussion, Mr. CHAMBERLAIN, the Secretary for India, intimating that the Government would accept it. He added that he believed that the Government desired to have information and to have a report at the earliest possible time. He quite understood that the House did not wish the report on that subject to be delayed until the Mesopotamian Commission had finished the whole of its inquiries.

Medical Men and Petrol

In the House of Commons on Tuesday, August 1st, Mr HARCOURT made a statement as to the apportionment of petrol supplies by the Petrol Control Committee. He said that medical men would get the full amount of their application up to a maximum of 50 gallons per month. If any increase of petrol became available this 50 gallons maximum would be the first to have further consideration when special need could be shown.

HOUSE OF COMMONS

WEDNESDAY, JULY 26TH

Deaths in Troop Train in India

Mr W ROCH asked the Secretary for India what regiments of Territorials took part in the journey by rail from Karachi to Peshawar, and the total number of deaths and of sickness.—Mr CHAMBERLAIN replied Drafts for several regiments aggregating over 1000 men were sent out together from this country, and I cannot at present give details. They will, no doubt appear in the report which I am expecting from India. 136 cases of heat-stroke occurred, of which 19 have, according to the latest information in my possession, proved fatal.

Colonel YATE asked whether the senior officer from the Indian Army Headquarters and the specially selected medical officer deputed to investigate the case of the fatalities that occurred early in June in the troop train at Rohri and other places between Karachi and Lahore had been instructed to report as to who was responsible for the despatch of these troops up country at that time instead of retaining them in Karachi till the weather was suitable for travelling, and, if not, whether orders to that effect would now be issued.—Mr CHAMBERLAIN answered I have already given to the House all the information in my possession as to the mission confided to the two officers referred to in the question. I have also informed the House that I have instructed the Government of India that when they have ascertained the facts and fixed the responsibility for this disaster they are to hold the persons responsible to strict account. I have nothing material to add to these statements, but my honourable and gallant friend may be glad to know that I have asked the Government of India to report specifically on the following questions: Whether the loss of life was due to the route selected or to the lack of proper arrangements for the journey, or to both causes combined, and as regards the route chosen, whether it was urgently necessary to send the drafts by that route at once or whether the drafts could not have been taken to Bombay and detained in stations in the Deccan till the monsoon broke in Northern India.

Sir A MARKHAM Did the Government of India take any steps when this matter was mentioned in the House of Commons, and what was the reason why there should be delay in settling the responsibility?—Mr CHAMBERLAIN The Government of India instituted, I think, an inquiry as soon as the case came to their knowledge, and they informed me of this lamentable occurrence in a telegram, dated I think, June 15th. In the same telegram they reported that they had instituted this inquiry and also that they are awaiting the result of that inquiry before fixing the responsibility.

THURSDAY, JULY 27TH

Health of Troops at Salonica

Sir E CORNWALL asked the Financial Secretary to the War Office whether the health of the British troops in Salonica and district was satisfactory, and whether, in view of the desire of their relatives and of the country generally for more information, he would arrange for the issue of occasional official bulletins with regard to these Forces.—Mr FORSTER replied Cases of enteric and dysentery have been very few, although there has been during the past three months some increase in the admissions to hospitals owing to the larger number of cases of malaria, diarrhoea, and pyrexia. The medical authorities however, consider that on the whole the health of the troops is satisfactory. The issue of official bulletins must, of course be dependent on there being anything to report. Such bulletins are, and will continue to be, issued when there is anything to say.

MONDAY, JULY 31ST

Approved Societies and Venereal Disease

Mr DENNIS asked the representative of the National Insurance Commissioners whether, in view of the report of the Royal Commission on Venereal Diseases that the rule by which Approved Societies were empowered to refuse sickness benefit to insured persons suffering from such disease was contrary to the interests of public health and the national economy, and of the endorsement thereof by the British Medical Association and the conference of Industrial Assurance Approved Societies, and of the inestimable advantage to the race as well as to the individual arising from sufferers obtaining proper treatment in the primary

stages of the disease, the National Insurance Commissioners would consider the advisability of recommending the Government to guarantee to the Approved Societies a deficiency in their funds as might result from the relaxation by them of the aforesaid rule.—Mr C ROBERTS answered The rule disqualifying for benefit a member whose incapacity is due to his own misconduct is optional, and can be revoked by the society at its pleasure. The issue of the Insurance Act therefore must be held to include provision for the payment of benefit in such cases. The problem is, in fact, not wholly or mainly a financial one, since the safeguarding of the benefit funds was not its object, so far as I am aware, which societies had in view in originally adopting rules of the kind in question. The whole question, to the vital importance of which the Insurance Commissioners are fully alive is receiving careful consideration. I am hoping to have an early opportunity of consulting Approved Societies with regard to the position of the rules.

Unregistered Dentists and the Supply of Cocaine

Mr RAFFAN asked the Home Secretary whether the draft regulations designed to restrict the sale of cocaine which had been submitted to the Royal College of Physicians as representing the medical profession, for their consideration had also been submitted to the British Dental Association as representing registered dentists, and the Incorporated Dental Society, as representing unregistered practitioners in dentistry, who were equally interested in the matter.

Several other Members had questions on the notice paper dealing with the same subject.

Mr H SAMUEL (answering all these questions together) replied The use of cocaine by registered dentists is not interfered with. As regards the persons who are referred to in the question as unregistered practitioners in dentistry I am aware that there are a considerable number of persons who do dental work without being registered under the Dentists Act but these persons are not possessed of the qualifications for the work which are required by that Act and are not entitled to take any step implying that they are specially qualified to practise dentistry. I have very carefully considered the position of these persons but it would go a long way to nullify the Order and defeat the object which the Government have in view if any person who chooses to set up as an unregistered dentist were permitted to obtain and administer cocaine. I see no reason for thinking that any serious hardship will be caused by the prohibition to the unregistered dentists or their patients. There are other and less dangerous drugs which can be used for the same purpose.

Mr HOGGE Why cannot these unregistered men have the same quantity of cocaine as they have been using?—Mr SAMUEL For the reasons stated in my very full reply.

Mr ANDERSON Is the right honourable gentleman aware that this drug can be supplied in a solution in less than 1 per cent under circumstances which will make its improper use impossible?—Mr SAMUEL We find it is necessary to have these stringent regulations in order that the very grave evil which is widely prevalent may be quickly suppressed.

Sir H CRAIK Is the right honourable gentleman not aware that these unregistered men constitute a very grave danger to the public and a great injury to the health of the community?

No answer was given.

Mr RAFFAN Will the right honourable gentleman give these men an opportunity of stating their whole case before he takes the drastic step of depriving them of the use of this drug?—Mr SAMUEL The regulation has already been made.

On the motion for the adjournment Mr RAFFAN drew attention to the prohibition of the sale of cocaine to unregistered dentists, to whom he said large portions of the community looked for dental treatment. The supply of registered dentists was not large enough for the needs of the population. It would cause pain and suffering to the patients of the unregistered men if they could not obtain cocaine for local anaesthetics for extractions. He was informed that no adequate supply of novocaine was available as the Government had taken it. The honourable Member urged that a relaxation of the regulations on the sale of cocaine should be made in favour of the unregistered dentists.

Mr SAMUEL in reply said I do not think that the honourable gentleman is correct in saying that the regulation deprives any unregistered dentist of the right to administer local anaesthetics. It deals only with cocaine and I am advised that among registered practitioners novocaine is used more than cocaine.

Mr RAFFAN They cannot get it.

Mr SAMUEL Novocaine is regarded as a safer and better means of applying a local anaesthetic and it is anticipated that the regulation will stimulate the production of novocaine. If it is the case that novocaine is really obtainable at the present time that is a new fact which is

of previously been brought to my notice, and it is a fact that I shall have to take into consideration I am advised that the right course if my honourable friend agrees, is to formulate the use of novocaine rather than make exceptions to the regulations restricting the use of cocaine. I am informed on very good authority that the application of cocaine may be extremely dangerous in the hands of unskilled persons. There have been some fatal and a large number of non fatal cases.

Mr RAFFAN. There are among the registered dentists—Mr SAMUEL. No unregistered dentists. I have had a number of specific cases mentioned to me within recent years of the death and serious poisoning due to unskilled use of cocaine and it is regarded by many as being more dangerous in its application than ether. A certain number of men who practise dentistry without being registered are also chemists and druggists, and all these men can obtain cocaine for the purpose of their dental business because they are also chemists and druggists and therefore free from the restrictions. Others, however, move about from place to place, they cannot be traced. A certain number of these men are of no very elevated character or remarkable skill or training and it is considered that there would be very great administrative difficulties in trying to organise a scheme if we allowed the use of cocaine by these individuals for the very reason that they are not registered. It is suggested that many of them belong to organisations. I do not know that it would be practicable to give these organisations an official status and recognise the use of cocaine by all the members of these particular societies. Certainly we cannot allow any person who chooses to call himself an unregistered dentist to obtain a supply of cocaine as though he were a registered person in recognised practice.

Mr CHANCELLOR. Can you issue licences under special conditions?—Mr SAMUEL. It would be a very difficult thing, especially now when all officials are greatly overworked, to establish an entirely new class of unregistered dentist in which every case would have to be inquired into one by one. I have listened to what has been said as to the question whether there are sufficient supplies of novocaine, and to that aspect of the question I will certainly address myself.

Mr RAFFAN. Will the right honourable gentleman not consider the question of giving a little time to these unregistered men? They might be ruined. At any rate he might consider the suggestions put before him which would enable the possibility of bad treatment to be prevented entirely.—Mr SAMUEL. I will do so. I will first see whether novocaine cannot be obtained quite freely.

Royal Army Medical Corps Officers in Egypt

Sir H. CRAIK asked the Financial Secretary to the War Office whether doctors employed in Egypt for a year had been informed that they must remain for a longer period and, if so, whether such doctors might be allowed to return to this country and to exercise their right of appeal to the professional committee.—Mr FORSTER wrote in reply. Yes. Sir. Temporarily commissioned Royal Army Medical Corps officers serving in Egypt who would on ceasing to serve as doctors become subject to the provisions of the Military Service Act have been retained beyond the termination of their year's contract. Their retention was necessary in order to provide adequately for medical requirements. It is hoped, however, that they may be able to return to this country at an early date when reliefs are available.

TUESDAY, AUGUST 1ST

Heat stroke in Troop Train in India. Government Action

Major ASTOR asked the Secretary for India whether he had any further information about the troop train disaster in which a large number of soldiers suffered from heat stroke.—Mr CHAMBERLAIN replied. I will read a paraphrase of a telegram received from the Government of India.

We can now give a considered opinion having received report of Committee. The responsibility for diverting the ship from Bombay to Karachi rests with Brigadier General Roe who was acting as Quartermaster-General at the time. He knew unacclimatised troops had never before been sent in large numbers by rail in the middle of summer through the Sind Desert. He knew or should have known that the Commander in Chief in December 1915 had decided that Karachi should not be used as a port at which wounded and sick British troops should be landed and distributed to other stations on account of danger of sending them in the hot season through Sind. It follows that before Karachi was directed to Karachi Acting Quartermaster-General should have consulted Commander in Chief and he did not do this. Having taken on himself responsibility he should certainly have warned Karachi military authorities to take special precautions for safety of troops during journey by rail. He did not do this. We therefore must hold him responsible and propose to remove him from his appointment of Deputy Quartermaster-General. It is clear from evidence that the mischief began before disembarkation. Many men having been seen on deck bareheaded in the sun. All the officers on board were quite inexperienced, and we cannot therefore hold them blame-worthy. The General Officer Commanding at Karachi was responsible for all arrangements for railway journey in his capacity as Embarkation Officer. It is shown from evidence that on the day concerned he was very busy but he had ample warning of Ballar's arrival. Though he knew responsible members of his staff

with one exception were inexperienced he took no steps nor gave any orders to see that the safety or comfort of the troops was provided for in this. We consider he failed in his duty and we propose his removal.

Special blame we consider attaches to the Assistant Director of Medical Services at Karachi an officer of long experience of the Indian Medical Service. In the circumstances it was undoubtedly his duty to see that every precaution suggested by medical science for the safety of the troops was taken. He failed in our opinion to do this. We therefore propose to remove him.

A number of omissions and errors on the part of other officers were committed but these were due partly to inexperience and partly to adherence to regulations intending to govern only the ordinary trooping in cold weather. We do not propose to take any action in those cases. The only excuses that can be urged in favour of the officers who are in our opinion responsible are that many of the casualties were due to facts that in many cases the men left their carriages bareheaded and that the temperature during the journey was unusually high. Nevertheless though these facts may have increased the number of casualties we are clear that there can be no doubt that the train left Karachi insufficiently equipped over-crowded and without experienced officers either medical or combatant. We place for these reasons the responsibility on Brigadier General Roe, on the General Officer Commanding and on the Senior Medical Officer at Karachi. All that was possible seems to have been done by the local authorities beyond Karachi throughout the journey.

I should add (continued the right honourable gentleman) that I have expressed my concurrence with the course the Government of India have announced they intend to take with regard to the three officers. I am inquiring whether special instructions for the removal of troops during the hot weather have already been issued and if not, suggesting that they should be issued at once, and I am communicating with the War Office at once in order that officers taking drafts out to India may be warned to take all precautions.

Appointments.

Successful applicants for vacancies Secretaries of Public Institutions and others possessing information suitable for this column are invited to forward to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week such information for gratuitous publication.

BLUETT D. C. has been appointed Resident House Surgeon at St. Thomas's Hospital.
CHEARLEY R. S. M.R.C.S. L.R.C.P. Lond. Acting Assistant Surgeon to the Royal Westminster Ophthalmic Hospital.
HAMILTON M. P. O. M.R.C.S. L.R.C.P. Lond. Casualty Officer and Resident Anaesthetist at St. Thomas's Hospital.
HARRIS J. R. Resident House Physician at St. Thomas's Hospital.
HENSLEY E. H. V. M.R.C.S. L.R.C.P. Lond. Casualty Officer and Resident Anaesthetist at St. Thomas's Hospital.
HYMAN O. H. Resident House Physician and also House Surgeon and Resident Anaesthetist at St. Thomas's Hospital.
JONES S. H. M. M.R.C.S. L.R.C.P. Lond. Resident House Surgeon at St. Thomas's Hospital.
MARRIOTT W. Resident House Surgeon at St. Thomas's Hospital.
MATROGORDATO A. M.R.C.S. L.R.C.P. Lond. Resident House Physician at St. Thomas's Hospital.
RIVETT LOUIS C. M.C. Cantab. F.R.C.S. Eng., Obstetric and Gynaecological Registrar and Tutor to the Middlesex Hospital.
SPROTT V. A. M.B. B.Ch. Oxon. M.R.C.S. L.R.C.P. Lond. Casualty Officer and Resident Anaesthetist at St. Thomas's Hospital.
VET F. H. Resident House Surgeon at St. Thomas's Hospital.
WHITCOMBE R. O. P. M.R.C.S. L.R.C.P. Lond., Casualty Officer and Resident Anaesthetist at St. Thomas's Hospital.
WILLIS A. G. P. B.A. Cantab. M.R.C.S. L.R.C.P. Lond. Casualty Officer and Resident Anaesthetist at St. Thomas's Hospital.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index). When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor.

BEDFORD COUNTY HOSPITAL.—House Surgeon, unmarried Salary as arranged, with board, &c.
BIRKENHEAD UNION INFIRMARY.—Female Resident Assistant Medical Officer. Salary at rate of £175 per annum, with board &c.
BIRMINGHAM AND MIDLAND EYE HOSPITAL, Church street.—Female Resident Surgeon. Salary £200 per annum with board, &c.
BIRMINGHAM CITY.—Female Assistant Medical Officer for Infant Consultation work. Salary £200 per annum.
BIRMINGHAM CITY EDUCATION COMMITTEE.—Two Temporary Assistant School Medical Officers. Salary £300 per annum.
BOLTON INFIRMARY AND DISPENSARY.—Female Second House Surgeon. Salary £200 per annum with board &c.
BRISTOL ROYAL INFIRMARY.—House Surgeons and House Physicians. Salary at rate of £120 per annum, with board &c. Also House Surgeon to Throat, Nose and Ear Department.
BURY INFIRMARY.—Junior House Surgeon. Salary £150 per annum with board, &c.
CARDIFF KING EDWARD VII'S HOSPITAL.—House Surgeon for six months. Salary at rate of £140 per annum with board &c.
CHARGING CROSS HOSPITAL, W.C.—Resident Medical Officer. Salary at rate of £-00 per annum, with board &c.
CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park E.—Resident Medical Officer. Salary at rate of £200 per annum, with board &c.

COVENTRY AND WARWICKSHIRE HOSPITAL.—Senior House Surgeon. Salary £300 per annum with board &c.
 DUNDEE ROYAL INFIRMARY.—Two House Surgeons
 GRIMSBY AND DISTRICT HOSPITAL.—House Surgeon Salary £5 6s per week; with board &c.
 GLILDFORD ROYAL SURREY COUNTY HOSPITAL.—House Surgeon. Salary £150 per annum with board &c.
 HOSPITAL OF ST JOHN AND ST ELIZABETH, 40, Grove End-road N.W.—Resident Medical Officer unmarried for six months. Salary at rate of £250 per annum with board &c.
 HUDDERSFIELD COUNTY BOROUGH.—Assistant School Medical Officer Salary £300 per annum.
 KING EDWARD VII'S HOSPITAL FOR OFFICERS, 29 Grosvenor-gardens S.W.—Resident Medical Officer
 LEEDS PUBLIC DISPENSARY.—Female Resident Medical Officer Salary £200 per annum with board &c.
 LINSEY (LINCOLNSHIRE) COUNTY COUNCIL.—Locum-Tenens Assistant Tuberculosis Officer for one month. Salary at rate of £400 per annum
 LIVERPOOL, DAVID LEWIS NORTHERN HOSPITAL.—House Surgeon for three or six months. Salary at rate of £150 per annum with board &c.
 MANSFORD, WEST KENT GENERAL HOSPITAL.—Junior House Surgeon Salary £150 per annum with board &c.
 MANCHESTER CORPORATION.—Temporary Assistant Tuberculosis Officer. Salary at rate of £350 per annum
 MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN Park-place, Cheetham Hill road.—Female House Surgeon. Salary £120 per annum with board &c.
 MANCHESTER ROYAL INF HOSPITAL.—Junior House Surgeon. Salary £120 per annum with board &c.
 MANCHESTER VICTORIA MEMORIAL JEWISH HOSPITAL.—Resident Medical Officer for six months. Salary at rate of £100 per annum
 MOUNT VERNON HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST Northwood, Middlesex.—Resident Medical Officer. Salary £120 per annum with board &c.
 OXFORD EYE HOSPITAL.—House Surgeon
 ROCHESSTER ST BARTHOLOMEWS HOSPITAL.—Clinical Assistant Salary at rate of £110 per annum with board &c.
 ST PANCRA'S INFIRMARY.—Female Junior Assistant Medical Superintendent of South Infirmary Pancras road N.W. and Junior Assistant Medical Officer of House adjacent. Salary at rate of £200 per annum with board &c.
 SHEFFIELD JESSOP HOSPITAL FOR WOMEN.—Junior Female House Surgeon unmarried for Gynaecological and Maternity Departments. Salary £150 per annum with board &c.
 SUNDERLAND THE ROYAL INFIRMARY CHILDREN'S HOSPITAL.—Female Resident Medical Officer for six months. Salary £100 per annum with board &c.
 WARRINGTON LORD DERBY WAR HOSPITAL.—Resident Anaesthetist Salary £1 per day, with board &c.
 WESTMINSTER CITY UNION INFIRMARY, Fulham-road S.W.—Temporary Assistant Medical Officer. Salary £250 per annum with board &c.

Births, Marriages, and Deaths.

BIRTHS

TOHAM.—On July 31st, at Hill Crest Chatham near Canterbury the wife of J. Arthur Toham, M.B.O.S., L.R.C.P. of a son

MARRIAGES

ALLNUTT—GAINSFORD.—On July 27th, at St Saviour's Church Hitchin Edward Bruce Allnutt Captain R.A.M.C. to Joan Cicely daughter of the Rev G. B. and Mrs. Gainsford of Woodside Hitchin
 MEDREY—KINGSMILL.—On July 29th at St. Andrew's Church Bo comba, Cedric Cowan Medrey M.D. R.A.M.C. to Phyllis Eileen youngest daughter of the late Judge Kingsmill of Toronto and of Mrs. Kingsmill now of Burnham Som

DEATHS

HILLBROOK.—On July 22nd at Nairobi Captain Wallace Hillbrook V.B., B.C. Camb. Medical Officer to the Congo Carrier Corps B.E.A. Expeditionary Force aged 24 years.
 LISTER.—On July 17th at sea, Lieutenant-Colonel Arthur Hugh Lister R.A.M.C. (T) M.D. C.M.G. M.O. 19th General Hospital Alexandria aged 51 years.
 POWER.—On July 28th at Holly Lodge, East Molesey Sir William Henry Power K.C.B. F.R.S. aged 73 years.
 N.B.—A fee of 5s is charged for the insertion of Notices of Births, Marriages and Deaths.

Notes, Short Comments, and Answers to Correspondents.

STUDENTS' NUMBER OF THE LANCET

INFORMATION intended for the Students' Number of THE LANCET must be sent WITHOUT DELAY, addressed to the Sub Editor, and marked on the envelope "Student Number Only"

THE NURSING PROFESSION IN INDIA

WHEN plague first broke out in Bombay a number of Parsi ladies volunteered their services as nurses in D. Bahadurji's plague hospital. Their services were very useful and greatly appreciated at the time by the Parsi community, but since then nursing as a profession has made any substantial advance in the community, because the recruits are not from the right class. While there at present a distinct want of educated and trained Parsi nurses, a number of Parsi ladies turn their attention to becoming graduates, and afterwards find it difficult to get appointments. Dr Masina was the first to initiate proper nursing of patients in the Parsi wards of the Sir Jamsetjee Jeejeebhoy Hospital; and he has now projected a scheme for training Parsi women graduates nurses, which will be put into execution if to begin with about half a dozen Parsi women graduates come forward to take advantage of the scheme. Dr Masina thinks that if a few educated ladies will serve as nurses old prejudices will die out, and their success should give a great impetus to other women graduates to take up the profession. Dr Masina lays great emphasis on the fact that the proper practice of the profession improves the moral tone of those outside the profession the same way as, or even in a better way than, missions work. To induce Parsi women of university education learn nursing Dr Masina has prepared a graduated scale of honorariums, commencing from Rs 50 and rising up to Rs 300 which will be paid to them during their training. After their full training exceptionally good nurses will be sent to Europe or America for higher training. The result of Dr Masina's experiment will be watched with interest not only by the Parsi community but by the Indian community at large.

TYPHOID MIXED VACCINES

Messrs Burroughs, Wellcome and Co. Snow Hill Building London E.C., prepare a series of mixed vaccines containing typhoid, paratyphoid A, and paratyphoid B bacilli. No. 1 contains in 1 c.c. 1000 million typhoid bacilli, 750 million paratyphoid A bacilli, and 750 million paratyphoid B bacilli. No. 2 contains half these quantities in 1 c.c. As is pointed out by paratyphoid A and paratyphoid B are responsible for a great deal of invaliding, although the mortality rates are low. Evidence goes to show that there is no diminution of the immediate immunity to typhoid by vaccination as a consequence of the addition of the other two organisms to the vaccine. The belief would appear to be justified on the other hand that the use of a mixed vaccine confers a definite amount of immunity against all three fevers.

"CRAIGLEITH HOSPITAL CHRONICLE"

THE August number of this journal has several articles of interest amongst them one entitled "Unusual Occasions Followed by the Blind," containing encouragement to those suddenly deprived of sight. It is shown how a blind clergyman may continue to follow his profession, how a blind man may conduct a coal agency, how a blind man may become the head of the firm, and how a man in such circumstances may earn £2 a week by selling flowers. The writer offers to give advice to blind people seeking suitable occupation or to those interested in them. The magazine (price 6d) may be obtained from the 2nd Floor General Hospital, Craigleith Edinburgh.

THE SALE OF MEDICATED WINES

THOSE concerned in this business have evidently found it inconvenient in complying with the General Order of a week ago to come into force on and after August 1, 1916, for the Control Board (Liquor Traffic) have issued a new provision. The Order now stands that in any case where such medicated wine or mixture of any kind is so sold or supplied at any time before the day of October 1916 it shall be deemed to be a sufficient compliance with the terms and conditions of this Order such sealed packet bears such label. The original or provided that the bottle should be labelled with a declaration giving the alcoholic strength of the wine in terms of proof spirit.

EDUCATIVE CONVALESCENCE

THE Cripple Home at Challey was founded years ago by the Guild of Plav and the Guild of the Brave Poor Things as a place where children should be trained to become independent of their physical fitness and make a well-drilled pageant of their work and play. With the Cripple Home are now associated the Princess Louise Military Wards and the Heritage Craft Schools; and Bishop Forrest Browne in an illustrated pamphlet has described how the trained crippled boys joyfully act as orderlies to the maimed soldiers and become their nurses and instructors, and how when convalescent the soldier finds the work of the carpenters and metal workers in the Craft School very catching, so that he consciously becomes a useful workman himself. The pamphlet contains many illustrations of the various useful activities of the soldiers as well as of the cripple boys and girls and the cripple babies in the Montessori School. The senior medical officer, Mr. H. S. Badenoch, M.R.C.S., writes on the medical aspect of the work. Funds are needed to continue it, and any further information will be gladly given by the founder and honorary secretary, Mrs. C. W. Kimmins, 'the Old Heritage, Challey, Sussex.

A USEFUL HOLIDAY GUIDE

A HANDY book entitled "The Holidays Where to Stay and What to See," published by Walter Hill 67, Southampton row, W.C., price 1s contains a selection of the holiday publications of the Midland, London and North Western, Great Northern, Great Eastern, Great Western, and the Great Central railways. The illustrations, maps, and notes on the towns and districts supplied by these railways as well as the lists of apartments, hotels and boarding houses should materially help the reader in finding a suitable holiday locality.

J. McO.—Our correspondent acted quite rightly in declining to enter into any such bargain.

R. L. is thanked for his interesting suggestion.

G. R. O.—Application should be made to the Incorporated Society of Trained Masseuses, 159, Great Portland street, W., or to the London School of Massage 211, Great Portland street W.

E. B. F.—Such synonyms do not present any difficulty to the qualified dispenser. There is undoubtedly a strong case against multiplicity of names for synthetic drugs but a competent dispenser should not be embarrassed by remembering "laudanum" as an alternative rendering for "tincture of opium."

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

EDITORIAL NOTICES

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR" and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners. Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES

THE INDEX AND TITLE-PAGE TO THE LANCET

January to June, 1916

In view of the Government restrictions upon the supply of paper, and the shortage of paper quite apart from these restrictions, the Index and the Title-page to the volume of THE LANCET which was completed with the issue of June 24th have been printed separately, and copies have been supplied gratis to those subscribers who have, up to August 3rd, intimated to us their wish to receive them. Other subscribers will be similarly supplied, so long as the stock remains unexhausted on application to the Manager, THE LANCET Office, 423, Strand, London W.C. Such application should please be sent in at once, direct to the Manager and not through Agents.

Volumes and Cases

VOLUMES for the first half of the year 1916 are now ready bound in cloth, gilt lettered, price 16s, carriage extra.

Cases for binding the half year's numbers are also ready cloth, gilt lettered, price 2s, by post 2s 4d.

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423 Strand, London, W.C., are dealt with by them? Subscriptions paid to London or to local newsgents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and not to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world

TO COLONIAL AND FOREIGN SUBSCRIBERS

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 4

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied

Communications, Letters, &c, have been received from—

Observations

or

THE EFFECTS OF TRI-NITRO TOLUENE ON WOMEN WORKERS

By AGNES LIVINGSTONE-LEARMONTH,
M.B., CH.B. EDIN.,

AND

BARBARA MARTIN CUNNINGHAM,
M.D. EDIN.

DURING the past five months we have made careful notes of the symptoms complained of by women working on tri-nitro-toluene (or for brevity TNT) in the munition factories in which we have been acting as women medical officers. There some hundreds of women come into contact with TNT in its various forms. We are convinced that the frequency with which these symptoms occur among the workers cannot be mere coincidence and must point to irritation by, and absorption of some toxic product of the explosive used. The work necessitates intimate handling of the powder, and the more floury or fine the powder the greater the amount of dust in the air of the shop. The symptoms complained of may be roughly divided into two classes—viz, irritative and toxic.

I IRRITATIVE SYMPTOMS

The irritative symptoms may be classed in groups as they occur in the respiratory tract, the digestive tract, and the skin.

A Respiratory tract, symptoms referred to the inhalation of dust—Nasal discomfort sneezing and occasional bleeding running of the nose preceded by a stuffed dry feeling occur. Smarting burning and sometimes watering of the eyes may accompany these symptoms. Severe frontal headache is often complained of due probably to nasal obstruction. The throat often feels tight sore, swollen, and burning. The chest feels heavy and 'tight'. Frequently a feeling of intense suffocation is complained of and a pain "like a lump behind the sternum is very common. This pain is sometimes described as a 'heaviness' or as a red hot lump and is occasionally referred to behind the shoulders. These respiratory symptoms have been noticed after only one night on the floury type of powder. Some workers complain of dry cough, followed by sputum described as a thick yellow phlegm with a bitter taste. In one case the cough was definitely paroxysmal and only relieved by the expulsion of a thick blob of the phlegm referred to. The irritative symptoms although naturally to be met as far as possible by the adoption of every reasonable precaution, are almost invariably quickly recovered from on transference to other work and in many cases even change of work is unnecessary as recovery is so rapid with suitable treatment.

B Symptoms referred to the alimentary tract—Constant bitter taste in the mouth with consequent distaste for tea, is complained of. Temporary increase of appetite is most marked, many workers stating that they could eat two dinners. Some women improve greatly in appearance for a time owing no doubt to the increase in appetite. Pain round the waist and in the abdomen is frequent. Almost invariably when asked to point out the site of the pain the patient will place the hands across the body over the region of the liver stomach, and diaphragm. The pain is spasmodic and gripping in nature and is accompanied by nausea and often by vomiting. The vomit is described as intensely bitter often yellow and sometimes green. Acid eructations are frequent. Constipation is the rule at first but later diarrhoea with motions "as green as grass" and with pain and tenesmus is more common. Gripping intestinal pains are also met with.

C Symptoms referred to the skin—Rashes are fairly common especially among the newer workers. They are generally situated on the face hands and neck but are seen on the feet and even on the thighs of workers who are careless of washing the hands before going to the water closet. The rashes on the hands are of two kinds (1) a

cheiropompholyx type seen on the webs of the fingers and on the palms of the hands, and (2) discrete red papules on the backs of the hands and wrists. These may become eczematous from scratching and infection. The eruptions on the face are also of two kinds (1) red papules as on the hands, and (2) a blotchy irregular erythema. Both forms are intensely itchy, and often prevent sleep. Fine desquamation follows the rash and in rare cases the skin is exfoliated in large flakes from the hands and feet. The rashes have been placed among irritative symptoms as they occur on parts exposed to contact with the powder the frequency of occurrence on neck and wrists being due to the friction of dust-infected garments. A similar rash will occur round the mouth of a worker who wears a respirator that is not frequently cleaned. Excessive sweating increases the susceptibility of the skin and may promote absorption. We have noticed that in those who perspire much or freely the symptoms are more severe. Workers on amatol and crude TNT blocks suffer from the same kind of rashes owing to the friability of the blocks.

II TOXIC SYMPTOMS

Many of the workers who have suffered in varying degrees from irritative symptoms will if kept on TNT, develop what seem to be signs of toxæmia. These toxic symptoms may be roughly classified under four heads (a) digestive, (b) circulatory (c) cerebral and (d) special.

(a) Digestive symptoms—These include continuous "bilious attacks" nausea, bilious vomiting anorexia constipation and jaundice. A dull aching or burning pain behind the ensiform is very common and persists throughout. In spite of the gastric symptom*, the tongue is very often clean and moist, though most workers complain of the constant bitter taste in the mouth.

(b) Circulatory symptoms—Under this head have been noticed faintness, giddiness hot and cold flushes pallor, slight cyanosis bradycardia, occasional palpitation air hunger, and swelling of the hands and feet. Two workers with no other ill effects showed us several large "bruises" on the thighs and arms, not to be accounted for by any external injury.

(c) Cerebral symptoms—Drowsiness is very common, and many workers describe it as a sort of drugged feeling. Depression, lassitude, and apathy are common. Transient loss of memory, slight disorders of sight (blurred vision &c) and a certain amount of transient peripheral neuritis have been noted in several of our cases. In severe cases delirium coma and convulsions occur towards the end.

(d) Special symptoms—Irregular scanty menstruation is frequently complained of. Dark coloured scanty urine with occasional scalding on micturition has been noted in many cases.

In most cases the toxic symptoms develop gradually but in a few there would appear to be a distinct predisposition to poisoning and in these the toxic effects manifest themselves quite suddenly. Judging from our series of cases, the following persons would appear to be unduly susceptible.

(a) Women inclined to anæmia, (b) those who have had previous gastric or liver trouble, (c) those who sweat freely or who are unclean in person, (d) alcoholics and those who are even slightly addicted to alcohol, (e) those who have had previous throat or chest trouble, and (f) persons of lowered vitality from over fatigue, malnutrition, &c.

From our observations we are convinced that the careful selection of suitable workers is of the greatest importance, and that women suffering from the physical disabilities mentioned above should be excluded.

It is curious that there seems to be as it were no constant relationship between the severity of the symptoms complained of and the ultimate issue of the case. A worker with severe gastric derangement when taken off TNT may completely recover in a short time, whereas slight loss of appetite and lassitude may (although the worker is removed from all contact with the powder) prove the gateway to serious illness and physical disaster. A patient too, may be jaundiced for some time and present no more symptoms than are seen in a simple catarrhal jaundice until of the serious cases enables us to judge. In most cases transference to other work led to rapid recovery, in a few instances the patient had to be confined to bed for a few days and in only one case did the toxæmia end in death in our series of cases.

TREATMENT

Treatment would naturally fall under two heads—viz, (I) prophylactic, and (II) symptomatic

I *Prophylactic Treatment*

As the irritative symptoms were considered in three groups, it seems suitable to discuss the prophylaxis from the same aspects

(a) *Respiratory prophylaxis*—Adequate ventilation for the workshops is essential. The air must be frequently changed and equable in temperature, and the circulation of dust should be avoided. The more skilful the worker the less dust raised. We have noticed that in a steam heated work shop on a winter night or on a damp summer night the symptoms appear more rapidly and are more severe. In our opinion this would point to the possibility of a volatile product given off under certain conditions of temperature and moisture. Many workers have told us that the powder affects them more when on night work.

To prevent the inhalation of dust veils and respirators are worn, but to both of these are attached disadvantages. Respirators need frequent cleaning, lest their edges, being in contact with a moistened epidermis, cause a rash. Veils are dazzling to the eyes at night, and unless held off the face by a hat-brim are in too close contact with the skin. If veils are worn brown or green has been found to be the most suitable colour.

If the above suggestion is correct that a volatile product is given off under certain conditions of heat and moisture, may not respirators, with their accompanying increase of both heat and moisture, be rather a source of extra danger? In the fatal case of poisoning to be shortly quoted we found that the worker had invariably worn her veil and respirator, and was, in fact, the only worker in that shop who consistently did so. It has been suggested that respirators, if worn, should be impregnated with some alkaline antidote.

(b) *Alimentary prophylaxis*—One of the most important of the preventive measures is the provision of suitable and sufficient food at proper intervals. The average working woman does not eat a "working man's breakfast," because (1) it is not her habit, (2) the hour of rising to catch her train is too early, or (3) the food has to be prepared by herself. Therefore she drinks a hasty cup of tea and, after an hour or more of a journey to the factory, starts work on a practically empty stomach. The provision of fresh milk or cocoa at the factory on arrival should be insisted on, and we have noted the marked improvement in the worker since the introduction of a ten minutes' break in the middle of the morning for a "snack."

Workers should be encouraged to eat hot dinners, and canteens to supply these are indispensable. Night workers find lighter meals, such as sandwiches, milk puddings, and stewed fruit most easily digested. Indeed, the most suitable diet for all T N T workers consists of fish, milk, fresh vegetables, and fruit. The women tell us they find that highly seasoned dishes, such as curries, tinned foods, and pickles, should be avoided, and that such "bring out the rash."

Bland drinks such as barley water, milk and water or milk and soda, are useful especially in hot weather and at night. Most workers do not drink nearly enough. Alcohol in every form is discouraged, and all workers are warned against constipation.

(c) *Integumentary prophylaxis*—Our workers use a simple powder for their faces and hands. Veils also protect the face, and gauntlet gloves should be worn, but they should be intact and free from powder inside and the gauntlet must be tucked inside the overall cuff. Overalls and caps are essential, the overall to fit completely round the neck and to cover the whole person of the worker. Frequent washing of these garments must be insisted upon. It has been suggested that they be cleaned by vacuum thus getting rid of the contained power entirely. Open work stockings should be forbidden. The hair should be completely hidden by the cap. Workers who are continually pushing back the "curls" are very apt to develop the rash on the face and the "curls" are very apt to develop the rash on the face and the eye symptoms. Working clothes should if possible be changed on returning home and underclothing should frequently be changed. Personal cleanliness is a great factor in prophylaxis.

The pink discolouration seen on the clothing of those who sweat freely is probably due to some substance excreted in the sweat. One worker, some time after removal from

contact with T N T, having bathed several times perspired so freely that her fresh clothing, and even the sheets, were coloured pink. We have noticed, however, that dry overalls used in the shops also turn pink when washed.

It may be of interest to note that one worker who had toothache, having filled her mouth with white loaf bread soaked in water to act as a poultice, was considerably alarmed on removing it to find that every particle of the bread had turned pink, and no bleeding had, of course, taken place!

Suggestions as to Special Prophylaxis

1 No person under the age of 21 or over 40 should be employed on T N T.

2 Employment should be alternated. The period of exposure to the powder should not exceed 12 weeks but in many cases this has been found to be too long. We have found that in some workers the effects of the toxin seem to be latent and although some women have worked for weeks on T N T without any apparent ill effects, they have developed slight symptoms after being transferred to other work. On the other hand, others after recovering from early symptoms, have finished the 12 weeks and had no further ill effects. Again, a few have shown a special idiosyncrasy and after a few days at the work have had to be permanently transferred.

3 The total daily exposure to the toxin must not be too long. Knowing, as we do that fatigue induced by whatever cause (overtime, malnutrition, &c.), markedly diminishes the power of the body to overcome toxins, we are of opinion that the daily exposure should not exceed eight hours. Longer exposure means increased chance of absorption when the blood is in a devitalised condition.

4 The provision of suitable washing accommodation at the factories and facilities for warm (not hot) baths for workers, together with arrangements for comfortable lodgings near their work, are of the utmost importance, as also are canteens to provide well cooked healthy food. Knowing, as we do, that "not absence of exposure but strength of resistance keeps us well," these things must be strongly insisted upon.

5 A routine weekly examination of all T N T workers is essential, so that any who show signs of over fatigue, anaemia, &c., may be taken off the work, at least for a time.

6 Work on T N T should be restricted to the day time. If our information and observations are correct, that the effects of the powder are more felt on night-work, the work should be discontinued at night. It is certain that the ventilation is less free at night partly owing to the air being too cold to allow of opening the windows freely, and in great part also owing to war conditions which necessitate the darkening of factory windows at night.

II *Symptomatic Treatment*

A *Of the irritative symptoms*—(a) Nasal &c. For these the usual remedial measures are adopted—viz. boracic lotion for the eyes, simple gargles for the throat and expectorant mixtures for the cough. Those who suffer from the choking feeling improve with plenty of fresh air.

(b) Gastro-intestinal. We have invariably given sodium bicarbonate for the gastric and biliary symptoms and have found it satisfactory. A supply is kept in the dressing rooms of the factories and given to any worker complaining of abdominal discomfort. For constipation, white mixture occasionally preceded by calomel or colocynth is our routine treatment. For diarrhoea we give a bismuth and soda mixture and for the abdominal pain nothing has been found so effective as sodium bicarbonate. (c) Skin rashes. We have found the skin conditions very amenable to any simple emollient, such as zinc and bismuth ointment, tragacanth and glycerine liniment or boro-calamine lotion, the patient of course being temporarily removed from the work on T N T.

B *Of the toxic symptoms*—The slightest cases of toxemia are removed from all contact with T N T till all symptoms have disappeared, and the more severe are transferred permanently from that department. For anaemia, mist ferri ammon cit is given, unless constipation accompanies it, when mist ferri laxans is substituted. For faintness, giddiness and nausea a mixture containing sod bicarb, spt. ammon aromat and gentian is useful. For nervousness perspiration and flushing we use a quinine tonic and for slight jaundice a mixture containing sod salicyl and sod bicarb. In all toxic cases a more or less open air life is advised until the symptoms pass. The diet should be light. Milk in all forms and large bowls of bread and milk are most

omforting As drinks, whey, milk and soda barley-water, and rice water Fish vegetables (especially green ones), and fruit, such as apples and oranges, should be ordered.

Of the severe cases of toxemia, merging suddenly into profound jaundice, delirium and death, we have had less experience. The treatment of such aims at stimulating the liver functions and getting rid of the excreted bile both by drugs and hydrotherapy. We have tried linseed and mustard poultices to the liver rectal and subcutaneous injections of saline solution, and hot baths, but so far with no permanent success.

As a simple cardiac stimulant spt. ammon aromat was useful but in severe cardiac depression pituitrin was found to be the most suitable drug.

The following tables show the frequency of the most common symptoms and notes are given of a few typical cases.

TABLE I.—Showing the Most Typical Symptoms in 12 Workers on T N T for 1 Week to 2 Weeks

CASE 1—Slight early symptoms with complete recovery. Patient aged 32 married. Time at work on T N T, 10 weeks. When examined before starting work in February 1916, she was quite fit physically. Mar 17th First visit to the surgery. Complaint Sickness and pains. Symptoms Eves sore and burning, throat dry and sore, nose running, no rash, slight palpitation severe, gripping girdle pain and pain behind sternum, gripping abdominal pain, nausea and sickness with green, bitter vomit. Has had nausea for two weeks and great thirst. Slight constipation, menses regular. Two nights ago rash all over chest and neck, but cleared next day. Tongue clean, lips dry gums normal, skin normal, hands very yellow, heart normal, lungs normal. Wears cap and overall, veil, respirator and gloves. Recovered quickly with appropriate treatment. Did not need to be taken off work. June 29th Still on T N T. Perfectly well. Has had no further discomfort.

CASE 2—More severe symptoms, transfer, complete recovery. Patient aged 37 single. Time at work on T N T four weeks. When examined before starting work on T N T she was quite fit physically. April 27th First visit to the surgery. Complaint Sickness, diarrhoea, severe headache. Symptoms Has never felt well on T N T. After three days' "bilious attack," took salts and went to her own medical attendant. No better so sent to surgery. Kept having turns of diarrhoea and sickness, and vomited oily stuff "just like castor oil, only all green and very bitter." Vomited four or five times a day. Diarrhoea accompanied by severe pain and tenesmus. Felt worse on flour powder. Said it "almost seems to drug you," and "you could go to sleep if you didn't keep a good hold on yourself." Tight chest, tickling cough, throat sore from retching. Condition Face pale flabby, eyes normal, conjunctivae pale, tongue dirty yellow, lips slightly blue, fading rash on face, skin itchy on face only, hands slightly yellow, not much perspiration, heart normal, pulse 70. Said she coughed up a lot of sticky yellow bitter phlegm in the morning.

Treatment Taken off work. Soda bismuth, spt. ammon aromat. Mar 1st Much better colour, occasional severe pain still has headache, cough bad phlegm as before. 4th Much better, pain gone, diarrhoea gone, cough easier, chest still tight. Resumed duty to-day but kept off T N T for a month. Given tonics. 28th Returned asking to go back to T N T. Still pale, cough not quite gone, eating better. Request refused. Given transfer to other work. Not to return to explosives. June 29th Quite well. Good colour, good appetite, good spirits.

CASE 3—Severe jaundice ending in death. Patient aged 25 single. Time at work on T N T five weeks. Admitted to the munition works on April 12th 1916. Taken off T N T on May 17th and off work on the 31st. Died on June 18th.

Previous health Patient was always "strong." Her only illness had been diphtheria at the age of 7 years. Never had any digestive trouble, and had never suffered from anaemia. When examined before starting work in April she was found to be quite fit physically.

The patient paid her first visit to the surgery on May 17th. Complained of "sickness." Duration, one week. No throat symptoms. Running at the nose, eyes felt sore, pain behind the sternum, nausea, vomiting of sour green fluid, itching of the skin of the chest, free perspiration, loss of appetite, slight constipation. She felt dull. 22nd Attended at surgery. Felt better. Sickness gone. The burning pain at ensiform still present. 26th Pain in the stomach. Vomited to-day. Conjunctivae very yellow. Tongue clean. 31st Attended at the surgery. Was sent up by medical officer at his routine visit as she was noticed to be jaundiced. Felt languid and "nasty", had occasional epigastric pains. Tongue clean. Lips a good colour, pulse 92, heart not enlarged, liver not enlarged upper border at fifth rib, lower border at costal margin in nipple line. Refused to come into hospital. June 2nd Admitted into hospital. Markedly jaundiced, tenderness over liver, bowels constipated, pulse slow low tension, occasionally intermittent urine faintly alkaline, specific gravity 1012, darkish amber, no albumin, no sugar, no free bile. From this date to June 8th no fresh symptoms were noted, but the intensity of the jaundice and the frequency of the vomiting varied. The urine was examined daily, and from June 8th it showed the presence of bile pigments, but never sugar or albumin. The stools were clay coloured and the bowels constipated. Pain was frequent over the epigastrium, and more deeply jaundiced on the 8th, and menstruation started. On the 11th she was distinctly better, and was brighter. The bowels were moved twice. 14th Was sick bile-stained. 15th Irritable otherwise as before. 16th Restless during the night, depressed, pupils semi-dilated edge very thin and firm and felt like cartilage, and was tender to the touch. At 1.30 P.M. the patient was very drowsy. She fell asleep while eating an orange. During the

ase consciousness proceeds to find a rational motive a mental process which should put us on our guard not only in our dealings with others. You will probably remember the advice given by Lord Mansfield to a newly appointed judge "Give your verdict. It is pretty sure to be right, never adduce your reasons—they are equally sure to be wrong."

The Meaning of the Hemianalgesia

I return to my Irish soldier to investigate the meaning of the hemianalgesia which developed, as we saw, under medical examination. Here I have to make an assumption—namely, that during the fight this analgesia was present, and that it passed away subsequently. It is a fair inference, I think, because he told us he felt no pain and when led away did not know he was wounded until his attention was called to the blood coming from him. In other patients I have similar records of feeling no pain and having loss of sensation from the time of the injury.

Assuming that he was thus analgesic during the fight, you will agree that we have here an error, or rather distortion, of perception. We know that no nerves were injured which could account for the analgesia and we know that the skin was normal. Sensation was conveyed rightly enough, but the unconscious mind refused to feel pain—a refusal of which consciousness knew neither the fact nor the motive. The unconscious acted here like Nelson did consciously at the Battle of the Sound. And for a similar motive Nelson wanted to go on fighting. So did my young Irish soldier—who was, as you may imagine, a very highly strung and sensitive individual. Had he allowed himself consciously to feel pain he would either have had to retire from the struggle or perhaps let go his clutch on the rifle and be killed.

We are now prepared, I think, to understand the revival of the analgesia under the pin pricks of Colonel Stewart. Of the first prick or two the unconscious took no notice but as the pricks continued the former memory was revived and the unconscious became on guard. The Turks are at it again—re-living a similar experience, the unconscious developed the same defensive mechanism—that is, the perception did not pass from the unconscious into the conscious.

No doubt many of us have been surprised at the language occasionally used by ladies of refined habits and careful education under anaesthesia or in mental aberrations. We wonder where on earth they could have heard such expressions. The simple truth is that they have never heard them—have never known them consciously. The words have been conducted to the unconscious but have not filtered into the conscious any more than did perception of pain in this soldier.

Before leaving this patient, although I have far from exhausted the material, I will hope that incidentally his case will help to remove the stigma that so unwarrantably is attached to the term neurotic. This soldier who has, I believe, been recommended for the V.C., is certainly a neurotic, but there are nice and nasty neurotics. He like the great majority of my hundred soldier patients, was of the nice kind.

Symbolic Conversion

In this case the paralysis was on the right side, but he was a left-handed man, in the great majority of cases dealing with right-handed people the diseased manifestation is on the left side. Oppenheim's accounts for the preponderance of left-sided over right-sided symptoms in these disorders by the relatively low vitality of the right hemisphere of the brain—an explanation of the unknown by the mysterious and vague. If you can attach any precise scientific meaning to Oppenheim's statement—"all there it is." Some years ago Stessel showed that in hysterical giddiness and fits there was a tendency to fall to the left side and he noted that right and left are used not only of direction but of mental and moral values. "He's all right." "To get out of bed with the left foot." In the posters of *The Girl who took the Wrong Turning*, the artist depicted the beautiful but naughty heroine as turning to the left at the cross roads. The left-sided manifestation is a symbolical expression for things are all wrong with me."

The positions of up and down are used similarly by the unconscious with an ethical significance—as we speak of a

fallen woman, top hole, down in the dumps, an elevating book, and so on. The translation of ideas into their verbal physical equivalents, as moral judgments, is a common mechanism in hysteria as it is in dream life.

CASE 2 (Case number 29).—An Australian, aged 36, was admitted on Jan. 24th for stiffness and pain in the back and paraplegia. The sensory and motor disturbances in the legs improved considerably, but the back remained as stiff as a ramrod and more painful. The history he gave betrayed much feeling at what he considered inadequate treatment after a high explosive shell had burst some yards from him on Nov. 10th. He walked down to the dressing station and was given some pills and sent back to the trenches. The next day his back was painful, but he says he showed himself to the doctor, who again sent him back. In the trenches he was unable to move. On the fourth day he was sent into hospital and thence to Malta.

You will understand that I am repeating this history not to criticise the medical officer nor need we accept the patient's story as the account of what really took place. I accept it for its psychological value—it expresses what the patient felt on the subject, a feeling which gave rise to much emotional bitterness, even under hypnosis. The clue as to the meaning of this rigid back was obtained one day when he said in hypnosis: "The doctor put my back up." There unfortunately the back remained when, having recovered the power of his legs, he was sent back to Australia, where I hope it will come down under the mollifying influence of his wife and children.

Another instance of this symbolism occurred in a case of recurrent mutism.

CASE 3 (Case number 50).—A lad, aged 21, was kicked on the left jaw by a horse on Dec. 31st. (He also complained of inadequate treatment.) On Jan. 1st, having been then admitted to hospital, he, whilst in bed, was taking part in a sing song when he suddenly found he could not utter another sound. He remained dumb till the morning of the 4th when on awaking he found he could whisper that he wanted his breakfast.

This is a pretty instance of another of Dr. Gees's aphorisms: "It is an interesting reflection that powerful emotion prevents eloquence and sometimes takes speech away." Whether the patient was an eloquent speaker I am not able to say, but I presume he was something of the sort, he was in the habit of preaching both before and since joining the Army. On one occasion after joining the Army he spoke for one and a half hours on the duties of a Christian soldier. He was always talking to his comrades, and nothing pleased him better than discussion or argument. Over and over again he had been told to shut up, hold his jaw. Now, after receiving the kick he went to his medical officer literally holding his jaw, and after the wound had been stitched was sent back to his tent. He felt inclined to remonstrate (to jaw) but thought it better to hold his jaw. Later in the afternoon the pain was so bad in the jaw that he was visited by the doctor and sent into hospital. The next evening however he found himself taking part in a sing song—an inconsistency to which the unconscious promptly replied by "holding his jaw" figuratively.

It must be remembered that we here are dealing with what is archaic and crude in the unconscious with what links us to the heirs of all the ages, mentally with primitive man. In this lower culture there is, as you are aware, no clear distinction between words and the objects they denote. The utterance of the correct word, the power of the word, has a magical effect, the Open Sesame and Rumpelstiltskin of the fairy stories have been believed and carried out in our childhood's play. A Central Australian has but to get the magician doctor to pronounce a curse on his enemy "May your heart be rent asunder, may your backbone be split"—the enemy's backbone is split unless he get on his side—a more powerful magician to ward off the words. You will find the Neapolitan fingering his charm whenever he by chance alludes to some good fortune, and the Britisher, laughing at this superstition, is not always above touching wood when amid say an epidemic of dysentery he should happen to say that so far he is quite well.

Functional Amblyopias

With these illustrations of the mechanism of symbolic conversion we may proceed to unravel a further significance. I choose a case of what the older physicians called anaesthesia of the retina termed by Captain A. D. Griffith in his lecture here "war amblyopia."

In an article in *Berl. klin. Woch.* quoted in *Brit. Med. Jour.* Vol. 3rd, Stekel *W. Jahrbuch f. psych. u. psychol. Forschungen* vol. 1 p. 457.

CASE 4 (Case number 26)—An Australian, aged 19, was admitted for loss of sight in the right eye, with normal vision in the left. There was a right ptosis present from childhood. He had been seen by Colonel Stewart and by the eye specialists, Captain W. M. Townshend and Captain Griffith. In the right eye on Jan 7th there was perception of light and nothing more, the defect had begun on Nov. 15th. This is the history he gave me. On Nov. 15th he was sniping through a loophole when an enemy bullet knocked a piece off the stock of his rifle. He continued at his post, five shots later another bullet struck the sand around the loophole. The right eye began to water. He shut the loophole and went away for an hour. He then returned, the eye being better, opened the loophole, posed his rifle, and then found he could not see the sights on the rifle. There was obviously nothing to do but go to the doctor. The vision got rapidly worse and in a few hours he had lost perception of light. Let me add that he was a lad of great, almost reckless, courage and of great independence of spirit.

The hysterical manifestation is, according to Freud, a compromise formation between a repressed wish and an inhibition, the result of a mental conflict between the ego instinct and the gregarious instinct—termed by Mr W. Trotter the "herd instinct." This Australian is a developed type of the gregarious instinct—his soldier's quality is strong. A bullet hits the stock of his rifle whilst sniping—the enemy have located him. You must remember he is sniping, so that to go away were quite allowable. But he does not give up. Then another bullet comes near. The unconscious, acting on behalf of the ego instinct, sets the eye watering forcing him to relinquish his post. Then the soldier's instinct asserts itself, the eye ceases to water, and he returns to the loophole. But here the egocentric instinct, self preservation, reasserts itself, and the unconscious adopts a stronger attack. He is stricken blind in the shooting eye (note, also, that it is the seat of a congenital deformity). He is now unable to carry out his conception of the soldier's duty and without loss of self respect is able to retire, his safety guaranteed. Shall we say that the compromise ends with the odd trick in favour of the egocentric instinct? Even so it will be granted from the measure adopted by the unconscious that he must have been a first-class fighting man. Blindness has always been regarded as one of the direct calamities that could happen to youth and you must remember that for some weeks he believed that his right eyesight was gone.

CASE 5 (Case number 59)—Indeed, in another soldier there had been loss of vision since the South African War in the right eye after he had been struck on the right eyelid by a pebble. For this he was receiving a small pension up to this war. Last May, following a shell explosion, the left eye began to fail. There was a considerable degree of hypermetropic astigmatism, which glasses failed to improve. After treatment he had as good vision, with the correcting glasses, as could be expected with the defect present, and which had, of course, no connexion with the injuries. He could read 6/18 in the right eye and 6/12 in the left. This will show how persistent these functional amblyopias may be, and what the conscious of my Australian patient may be said to have bargained for.

Fear and its Disposal

Fear and its disposal I propose to illustrate by the following case.

CASE 6 (Case number 45)—The patient, a private in the Royal Engineers, aged 25, had gone through the Gallipoli campaign without a scratch and, as he says, with practically no fears, and was later frost bitten in Salonica. He was sent to hospital on Dec 18th. When he came under me on Feb 7th the finger of the right hand was well, but there was some loss of grip. He was then suffering from insomnia, terrifying dreams and shaky hands. On Dec 6th at K—when holding horses on a flying bridge the animals started and he was thrown into the water, he was picked out none the worse. The next day it happened that his horse was shot under him, but he escaped. A few days later the finger got frost bitten and he was sent to hospital where his hands began trembling, sleeplessness came on, and severe headaches.

The patient is a thick set, sturdy fellow, jovial and kindly, the son of an agricultural labourer. The thyroid was diffusely enlarged, but there were no ocular signs of Graves's disease and no signs of disease in the central nervous system. The blood pressure was high and he showed lymphocytosis. There was a fine tremor of the hands six to the second. The pulse was irregular and rapid, and there were not infrequent attacks of cardiac palpitation—almost anginal in character. The extremities were cold and blue (only one finger on one hand had been frost-bitten), he

sweated violently in the palms, there was hyperaesthesia to sound, occasional attacks of dizziness, and a few frequent desire to micturate.

You will agree that this is the description of a state of fright, such as many may have experienced in the examination hall when the hands get a little tremulous, the palms sweaty, and sometimes these dreadful impressions are provided with extra latrine accommodation. The changes and the thyroid condition raise such difficult and controversial questions that I do not burden this paper with the subject. I would just remind you that Weichardt⁵ has shown that in the mental fatigue of school children the blood is toxic. He even prepared an antileptotoxin which he proposed to sprinkle over the schoolrooms.

To return to the patient—his terrifying dream was always the same. "I see a Frenchman digging a knife into a horse. He gets off his cart to do this. It is in Serbia." Not only at night but during the day this comes up as a vision. It is an actual occurrence. He saw a French transport soldier, drunk, get off the wagon and plunge a knife into a mule to make it go. With some others he stopped the Frenchman and drove the wagon into quarters. (Note, the mule becomes a horse in the dream.) The patient's feelings about horses were very intense. He had been used to horses since childhood, his earliest recollections are of driving with his father or of being put up on the plough horse. As a boy he was engaged about the stables and then became a groom. He wept profusely when talking to me of the sufferings experienced by the wounded mules in Gallipoli, and when I suggested that human beings suffered more he would not have it so. Animals could not talk. No animals should have been allowed there he said. He never had any trouble with horses, for he understood them exactly, and he was always given the difficult ones to manage. In short, he was as doting on horses as any dowager duchess over her fido.

We suspect all exaggerated sentiments—methinks the lady does protest too much. Investigation soon showed that the suspicion was justified. He identified himself with the horse. He was the horse of the dream, it is he who ought not to have been in Gallipoli—it is too much for him and others. Consciously the soldier instinct in my patient would know no fear for himself. But as the Latin satirist says—

*Primus in orbe deos fecit timor*⁶

Fear is a primary natural instinct, and, like murder, will out. So long as the patient was actively engaged looking after the horses he could expend all his mental excitement in pity for them—i.e., himself. But condemned to inactivity by the frost-bitten finger this mental excitement (which even before had been abnormally expressed) finds no outlet, emotionally or actually. Could it reach consciousness the patient would have been able to deal with it as he subsequently did with our help. These frequent cases of tremors and the like are invariably due to fear thus bottled up—repressed from consciousness (not necessarily fear of shrapnel) and not being acknowledged or worked off become morbid fear (i.e., morbid because it is no longer objective).

That the person should become a horse in the unconscious will not startle anyone who has dipped ever so little into the totems and taboos of the lower races. The kangaroo tribe, for instance, as Sir J. G. Frazer⁷ shows consists of kangaroos and kangaroo-men, who actually are kangaroos and delight to show their identity by identity of action. But, indeed, it is not necessary to travel to Australia. Who of us has not galloped as a horse, pawed the air, impatiently neighed, and chafed at the bit. And when some day our child comes galloping into the room kicks over a chair and seizes some food from the table with his teeth—we understand. We do not say "Don't Dickie" but we pat the mettlesome steed on the head, feed him from the hand with lumps of sugar and bits of apple, we softly rub his nose.

⁵ Weichardt, School Hygiene vol I p. 226 and vol II p. 191.
⁶ Amor Freud spells it. He and Petronius Arbitrator are both wrong. In the image of God created He man is correct psychology.

⁷ In the Alcheringa lived ancestors who in the native mind are so intimately associated with the animals or plants the names of which they bear that an Alcheringa man of any the kangaroo totem may sometimes be spoken of as a man kangaroo or as a kangaroo-man. The identity of the human individual is often sunk in that of the animal, from which he is supposed to have originated. See Sir J. G. Frazer, *Native Tribes of Central Australia*, quoted by J. G. Frazer, *The Magic Art* vol I p. 107. There was no sharp line of distinction drawn either in theory or in practice between a man and a totem.

We understand. The father is no longer everything that is wonderful in strength and power, there are other great spirited creatures too. And perchance we silently pray. May all future adaptations be as gleefully and successfully accomplished, as happily understood by ourselves and as little thwarted.

A Case of Maladaptation

It is with a case of maladaptation that I will conclude. But first I would like to formulate what I hope has been established in four propositions: (1) That the psychoneuroses among soldiers are capable of understanding in psychological terms, (2) that the symptom is a symbolic (disguised) expression of an unconscious mental process, (3) that the mental process may be the resultant of a conflict between two divergent impulses—the egocentric and the soldier's instinct, (4) that morbid fright is due to pent-up emotions—stored up fears—that have not been acknowledged or actually worked off.

I pass on to consider whether the matter is quite so simple as I have put it in my third proposition where following Freud, I have stated that the neurosis arises as the conflict between a repressed desire and an inhibition. Freud is the pioneer and master of us all in this sphere of psychology, his genius has given us a key by which to unlock the human mind but we are bound to go on with the exploring on our own account. We shall proceed to explore by the help of—

CASE 7 (Case-number 40).—The patient is a married man, aged 29, a private of some months' service, who after three months in France was sent to Salonica where he was invalided for severe and persistent backache, insomnia, and occasional enuresis. On Feb 5th 1916, he presented a widespread analgesia, with odd normal patches, and a zone of hyperaesthesia in the lumbar region. It is his mental condition however, that I desire to bring into notice. There were sleeplessness, general restlessness, inability to fix his attention on anything for more than a few minutes. In conversation with his mates he would, for instance, be suddenly quite oblivious of what they had been talking about and felt uncertain whether he had spoken or not. He read for a few lines and would throw down the paper. In writing home he once told me that he had begun 20 letters, destroying each, and then finished a few lines. He was so "shy" that he could only with difficulty walk along the hospital ground feeling then that everybody was looking at him. He had found it impossible to number off in the ranks and had to address his commanding officer he would be quite speechless. He was morbidly anxious about his family though he had no reason to suspect illness he would carry a letter from his wife two or three days in his pocket before venturing to open it, lest there should be bad news.

There were numerous obsessions or eccentricities. In walking he must mark each flagstone and touch each post. He had the impulse to count and to arrange things in patterns, counting on his fingers or the panes of windows in the rooms and arranging them in sets of twos, threes &c. An obsession that came to light was an impossibility to go into a shop or restaurant alone. By dint of great effort he could thrust himself into a hosier's or a tailor's shop alone after a careful survey to ascertain that no other customers were present. This peculiarity was the cause of numerous embarrassments. His wife to whom he was ashamed to confide the trouble would ask him to buy something when he was going out. He would assent realising at the same time the impossibility of the task and already inventing some lame excuse to be presented on his return. Often had he gone without a meal when morning alone because he could not face going into a restaurant.

At times a cloud seemed to come over him and he did not seem in the world at all but was without a spectator watching and but dimly interested in the movements of men and women himself included. He was a well-educated man a public school man with a well-developed and a subtle intellect well orientated in space and time. He realised quite as well as do you or I the absurdity of his obsession and as he said to me "I know I'm a damned fool and it's no good, but there it is I cannot help myself."

In short you will see we have a well marked type of psychasthenia such as Janet has described so graphically in his work on obsessions. Time does not permit of a detailed examination of these phobias and obsessions some of which, indeed, were never analysed out, but I want to deal with the general faulty direction of this patient.

We learn much from his history—

We note that he had never done any work since he left school at 15 until he joined the Army as a private. He had substantial private means. He had been married three and a half years and had a son, and was devotedly (morbidly?) attached

to wife and child. His time had been engaged in travelling about the world in various sports—he was an excellent shot and was selected for sniping in France, where his "bags" brought him great credit. He was the son of a well-to-do shipbuilder and from the earliest days was passionately interested in ships and engineering. His school holidays were chiefly spent in his father's or the adjoining yards, and he was always planning and later on designing new kinds of ships and engines never to be used. During his boyhood's holidays he would accompany his father on business journeys and would sit in the customers' office whilst business transactions were carried on—always, in his own words "gloating with joy at his father's cleverness and talk."

He passed creditably through school did quite well at games, and it was understood that he would enter his father's business. On leaving school his father said "No need to hurry about business, take a couple of years and see the world." He then returned ready and anxious to enter business. But the father suddenly had a "nervous breakdown" and the son was compelled to remain in the closest attendance upon his father for the next year. The sick man would have no one else near him, and would not listen to the youth's approaching the business. The father better, the son felt the real need of a change and went away for six months, he returned and again there was the talk of his entering the business. His father had a second attack, and again for a whole year the son was chained to his father. He then again took some months' rest, and on his return the father had withdrawn from the business, and there was no longer talk of the son's doing anything. Indeed, any approach on the subject seemed so to agitate his father that his son, fearing another attack, avoided the subject.

This brief sketch will suffice to demonstrate the dominant part played by the father—the patient was assuredly the father's thing—no independent being. Let me quote an incident. My patient was at a seaport when he was about 21 awaiting a ship to go abroad when a friend of the family met him and invited him to stop there. He could give no reply was extremely embarrassed and wired to his father to come and help him. The father travelled four hours journey and my patient felt completely at ease when he was able to meet his father.

Now it is easy to see the position. We learn that the boy passed through a normal schooling and that no symptoms developed until the father's breakdown, and that this breakdown was the frustration of the patient's all ambition—to build ships and engines, to invent new kinds. That was his special work in life. Love of father, mother to be a husband, father, &c. these he shared with humanity in common—but shipbuilding, that was the individual thing which absorbed such energies as were not to be devoted to the common duties of life. His father stood to him for power and ships and engines—through the father he could climb to his own pinnacle. And then comes failure. The patient, inhibited from following his home regresses, turns back and seeks in his phantasies the consolations and the position which belong quite legitimately to childhood, but do not fill up the adult outlook.

I have spoken of the unconscious as something archaic and crude but I now want to correct that by adding that the unconscious is also creative and elaborative. A cross-section, so to say of any mind at any given moment would reveal not only the past but the germs of the future—the potentialities to become realities with time. The psyche never is, but is always becoming—changing, there is ever an onward thrust. It is to this dynamic psychic energy that Jung gives the term *horne*. My patient did not pursue his *horne*—he did not, if you will allow me the expression give objective value to his soul through ships. Hence his suffering. You see he could marry and fulfil some common objectives of life. The difficulties were here enormous—granted but life is relentless. Difficulties must be surmounted. And the patient is learning this.

I will give you two of his latest dreams to illustrate his new adaptation. Dreams says Freud, are the royal road to the unconscious. Their analysis is the chief help the patient gets to an understanding of his hidden self. Of course, much fun has been poked at dream-analysis which is likened to the dream interpretation of the ancients. With this it has as much resemblance as has modern urinary analysis to the water casting of the Middle Ages. Our predecessors recognised that dreams must have some message, but they had not discovered the clues to read it.

If you have followed me in the account I have given of symbolic conversion in hysteria you will have no difficulty in understanding the principles of dream analysis. We have

again here ideas represented by their physical counterparts, the clue to the symbolised is obtained from the dreamer's "free associations" to each picture. He dreamt—

I was in a cargo boat in the river, we were steering straight into the ferry and harbour. The pilot rang down full speed astern. I pushed him out of the way and rang down full speed ahead, two points to starboard. We went straight past ferry and harbour without accident.

A few days later—

In a motor-car, came to some rocks which sprang up in front of me. The machine broke down. I abandoned it and walked, clambering over the rocks. It was tough work. My object was a ship. I got to the ship, took hold of the wrench and signalled to let go.

We found by analysis that the pilot in the first dream and the motor in the second stood for the father. The meaning became clear. He must first sacrifice (knock down, abandon) the father element in himself, then his home (ship) will be directed ahead and in the right way (starboard). There are difficulties (rocks) ahead, but he will climb over them. When the unconscious of our patient has reached this, when he learns that he must surrender that which is infantile and immature in himself—that clinging to the father—that he must be master of himself, we have reached a new view-point. All his will-power will be still required to make good the lesson, but he need no longer be the victim of unknown impulses. He is not cured—doubtless he will regress many a time before he hacks his way through life, but the way of understanding has been given to him.

Psycho-analysis and Hypnosis

By psycho-analysis the patient must reach out to a realisation of his weaknesses, his limitations, his vocation. Effort of will is demanded to make the synthesis which is disclosed as his. In suggestive therapy the will-power is employed to overcome a difficulty or a symptom without any bitter self-realisation of the meaning of that symptom.

Hypnotism has been most successfully applied in the treatment of our soldiers, because in most cases the neurosis has arisen under the strain of quite extraordinary conditions. I would remind you that our Army is not composed of fighting men in the technical sense. The men came from the mill, the mine, the farm, the counting house, the country house, every trade was represented and every class. Thus, the man brought up to a quite other avocation was suddenly with scant training, called upon to make a new adaptation. In the stress and strain of their normal life they would have probably been equal to any emergency. But for some—among the very best—the new condition called out to them to strain themselves to the utmost, and this was just a little too much.

A word as to treatment. Major F. W. Mott in his Lettsomian lectures says: "I do not find hypnosis or psycho-analysis necessary or even desirable, only common sense and interest in the welfare and amusement of these neurotic patients are necessary for their recovery." This contrast between common sense on the one hand and hypnosis and psycho-analysis on the other betrays, I fear, a survival of the medieval fear of witchcraft. It reminds me of one of my patients a mute.

CASE 8 (Case number 4).—This soldier was in a mine accident eight years ago when his brother was killed and he lost his speech, which recovered spontaneously after 18 months. Following a shell explosion in Gallipoli he was again stricken speechless and deaf, he came six weeks later under me and objected (in writing) to treatment saying that he believed in Nature's methods. God had taken his voice away before and had restored it. I replied (in writing) rather irreverently, that God had taken 18 months, I could do it in a few minutes. He afterwards relented, and speech and hearing were duly restored in the time promised. To his expression of thanks I replied now more reverently that I was merely the instrument of Providence.

There is no such antithesis as Major Mott supposes. Whether the patient gets better by a dose of Major Mott's common sense, or spontaneously recovers, or recovers by suggestion in the waking state or under hypnosis, the effect on the patient is just the same. The patient has not learnt though he may obtain intellectual apprehension, the significance of his illness. I employ the method that seems best adapted to bring about a speedy cure, sometimes suggestion in the waking state sometimes under hypnosis, with such other aids as we can obtain for our patients

—including the invaluable assistance of the sisters and orderlies.

I have explained why in my opinion, hypnotism works so satisfactorily among soldiers, and on the same grounds it seems to me quite safe. We have a neurosis arising under exceptional conditions, a neurosis not likely to recur when the patient returns to his normal life. Hypnosis is easily induced among soldiers. Out of 78 cases, only 3 could not be hypnotised at the first attempt, of these 3, one was hypnotised later after practised auto-suggestion, and the third was refractory (Hypnosis, of course, does not cure). Of another 27 patients, some were treated by rest in bed and others are cases of various psychoses, only 5 patients were treated therapeutically by psycho-analysis. When a pre-war neurosis exists, such as the case I have briefly described, there is no substitute so far as I can see. Psycho-analysis was, of course, used for purposes of diagnosis or with a view to helpful suggestion in most cases, but used in this way, the patient learns nothing, of course about himself. He is simply got into a communicative mood about himself. You let him gabble on giving his dreams, &c., and pick out the golden threads for your own purposes.

Conclusion

If anything I have said should lead to a further understanding of the British soldier I am well content. Napoleon used to say that the British are a nation of lions led by asses. The lion is still there and let me remind you, lest you forget, that the lion is just our old friend the British working man. Eighteen months ago our first case alluded to, the hero of the 15 bayonet wounds was a plumber!

I should like, in conclusion, to express my thanks to the consulting physicians of the island, Colonel Garrod and Colonel Purves Stewart, especially to Colonel Stewart for the generous help he has always given me with his notes on the cases. Nearly every case was seen by Colonel Stewart and the diagnosis made or confirmed by him prior to treatment. I need not add how great an advantage and relief this is to the psycho-therapist. My thanks are due also to many colleagues who have sent their cases to me for treatment and to my friends, Lieutenant Paton and Lieutenant Keane for much real help.

THE TREATMENT OF INFECTED SUPPURATING WAR WOUNDS

By RUTHERFORD MORISON, F.R.C.S.

PROFESSOR OF SURGERY, DURHAM UNIVERSITY, SENIOR SURGEON, NORTHUMBERLAND WAR HOSPITAL.

Wound infection has been the great surgical curse of this war. Until recently all the means I had seen tried at our War Hospital had failed to satisfy the most moderate surgical ambitions. Since I have now developed a simple method, necessitating but few dressings by which many wounds can be sterilised at once, while in the remainder, as far as my present experience goes the spread of infection can be checked and limited, I consider it a duty to submit results without further delay.

The steps of treatment are: 1. Under an anæsthetic usually open either cover the wound with gauze wrung out of 1/20 carbolic acid and clean the skin and the surrounding area with the same lotion. 2. Open the wound freely and if possible sufficiently to permit of inspection of its cavity (in doing this special regard must be paid to nerve trunk and muscular branches of nerves since the division of blood vessels excepting the largest end of the muscles themselves does little harm as compared with that of the disfigurement following nerve damage). 3. Cleanse the cavity with dry sterile gauze, mop, Volkman's spoon, &c. and remove all foreign bodies. 4. Mop the surrounding skin and the wound cavity with methylated spirit. Cotton wool mops conveying the spirit are used for this purpose and are introduced with forceps. 5. Fill up the whole wound with the paste described in the footnote below. Dress it with sterile

1 The paste Bismuth subnitrate 1oz by weight. Iodoform 2oz by weight. paraffin 1lb by weight. I suggest for the name Bippo. A convenient means of applying it was suggested to me by Sister M. J. of War 122, who gave me two lozecs of it. One to lift the paste and the second to plaster it in and on with

gauze, and cover all with an absorbent pad, which is held in position by sticking plaster and a bandage. This dressing requires no change for days or weeks if the patient is free from pain or constitutional disturbance. Should, however, discharge come through the stained part must be soaked in spirit and a gauze dressing, wrung out of the same applied as a further covering.

The advantages of this treatment have been most striking in cases of compound fractures of the long bones. Previously such compound fracture patients suffered so severely that their treatment had proved an ordeal for all concerned. Such cases now are associated with little more suffering and trouble than those of fracture without a wound at all. Lesser advantages are that during the period when frequent changes of dressing were necessary several nurses and orderlies were employed in my wards doing little else than dress wounds. I now in two hours and once a week dress nearly every wound myself.

Redressing is very simply done. After removal of the old dressings the wound is covered with a dossil of wool soaked in spirit, and the sticky, dirty looking discharge is wiped off the surrounding skin until it is clean. This is done with dossils of cotton wool soaked in spirit and applied by forceps.² The wound and a small area of the surrounding skin are then plastered with paste which in its turn is covered by a gauze dressing under a pad and bandage.

It is obvious that time and opportunity are needed to work out explanations and to suggest further applications of our scheme of treatment. Improvements in technique are also inevitable. Meanwhile our pathologist, Dr Helen Clark, is interested in her part of the work and is endeavouring to find a solution of the many questions which arise in connexion with it. I may state that we have both thought that the anaerobic conditions produced by the absence of drainage and by the presence of the paste may have some influence in regard to the clinical results achieved, but we recognise a possible danger in its application to wounds at the front. There is some evidence against the anaerobic view provided by two of the cases to be recorded, but my own expectation is that fresh wounds will be found to respond satisfactorily to treatment by the method described. For such fresh wounds—when infective gangrene is still to be remembered as a serious possibility—I suggest that, meantime and experimentally, free drainage be employed after the cavity of the wound has been mechanically cleaned and plastered over with the paste.

Iodoform poisoning.—Twenty five years ago it became a fashion with some surgeons to fill wounds with iodoform powder and sew them up, and I had the opportunity of seeing several cases of poisoning with some deaths. I reminded my resident surgeon, Dr Evelyn Ritson of the early symptoms produced, these are hollowness of the eye sockets, with a dark rim surrounding them, a dry red tongue frequently an elevated temperature and some muttering delirium. She drew my attention to one patient a case of reamputation of the thigh whose stump had been rubbed over and packed with the paste, who had occasional mild delirium commencing a week after the operation. No other sign of iodoform poisoning was present, and he looked well. It transpired that he had not slept well since he was wounded and had had little sleep for some nights. He was very well next day after a dose of morphia at night. This is the only case we have had suggesting that dangerous iodoform absorption might have occurred. Children, so far as I remember have a peculiar susceptibility to it, and I happened to have under my care a child 4 years old with tuberculous peritonitis and double septicæmic abscesses of large size. Her chance of recovery unless something new could be done appeared to be so remote that I filled both abscesses with the Bipp. More than 1 oz. of the mixture was used. This was done on May 22nd. From that time she has slowly improved and there were never any signs of iodoform absorption which I regard as a good test of its harmless character in the present combination.

I have often been asked what happens to the paste but that question requires further knowledge to answer completely. Some of it we know is extruded and this may occur late and after the wound is apparently healed. A small sinus forms from which iodoform and a brownish discharge escape but our present experience is that this

quickly heals. In the great majority of cases the mass appears to be slowly absorbed.

Osteogenesis.—With X rays it is possible to watch the disappearance of the mass of 'Bipp' and its replacement by new bone. The first case reported suggests that the paste may stimulate osteogenesis. The rapid union which has been noticed in some of the fractures supports it. I am indebted to Dr T. L. Bunting radiologist to the Northumberland War Hospital, for X ray reports and photographs.

Catgut.—In several of the exhibited cases³ it was noted that thick catgut sutures were used to close the wounds made for exposing the cavity. This was employed as a test of the efficacy of the methods used as catgut sutures offer the most definite clinical evidence of any fault in wound treatment. A skin suture of catgut, chromicised or plain should cause no redness nor irritation when properly applied (i.e., not tightly, but only tightly enough to bring about apposition) if the wound and skin have been made surgically clean. After using them in several hundred cases I can make this statement with full confidence of its truth. A mild infection causes a red circle on the skin round the suture, a worse infection makes the red area weep, and a gross infection leads to destruction of the tissues round the suture with pus formation the suture being cast off as a slough.

Phagocytosis.—Absorption of the catgut is the result of phagocytic activity, and if this is inhibited from any cause the period required for absorption is prolonged. Some of the cases show that healing of the wounds sutured by catgut occurred by 'first intention' and that the sutures were absorbed. This is the best proof we can at present offer that the wounds were surgically clean.

Results.—In more than 40 cases treated by the method described we have found no need to change a dressing sooner than intended. There has been except in head wounds no spread of septic infection, no cellulitis nor abscess formation and no aggravation of constitutional disturbance after the operation. Relief of pain and fall of pulse and temperature when they were abnormal has been the invariable rule. The application of these methods is, of course, not limited to war surgery, and I have used them with equal success in the ordinary septic infections of civil work, but in making such revolutionary claims I prefer to offer notes of verified results.

On June 22nd 1916 I gave a demonstration in the Northumberland War Hospital during which distinguished surgeons were present and showed amongst others the following cases—

CASE 1.—Gunner aged 39 wounded on Sept 20th, 1915 by shell. On admission to Northumberland War Hospital on Oct 12th in addition to many other wounds he had one over the tip of the right os calcis and another over the anterior part of the heel. Oct 17th A piece of shell came out of the heel (underneath). X ray showed fracture of posterior angle of os calcis, several loose fragments. Nov 15th Heel still discharging a good deal. Nov 17th Foot swollen and inflamed, good deal of discharge, dressed with boracic fomentations. Second X ray "There does not seem to be any change from view shown on previous plate taken a month ago."

Nov 26th Operation by Dr Stanley Robson, under Professor Morison's supervision, tourniquet used. Incision made in middle line of heel from scar of entrance to sinus of exit of the piece of shell. Soft parts reflected from os calcis for a short distance. Cavity in os calcis cleansed of bone debris and a considerable quantity of granulation tissue. Cavity mopped with pure carbolic acid⁴ followed by spirit, then packed with 'Bipp,' and the edges of the wound brought together by a single catgut suture in the centre.

Dec. 1st Dark stained serum through dressing. Some of the iodoform packing on dressing. X ray showed a mass of opaque material, probably iodoform. Jan 1st Some paste extruded, wound looking clean. Jan 6th X ray "Cavity as shown by iodoform shadows, is distinctly smaller and almost entirely outside bone." March 2nd Patient sent convalescent wound still extruding a small quantity of paste through tiny openings. April 12th Patient returned from convalescent home complaining of pain in treated heel which had healed a few days after he left hospital. X ray showed exostosis on under surface of os calcis.

² So far as I can at present judge all infected discharge comes from the surface of the wound in the neighbourhood of the skin. The paste in the depths is clean and should not be disturbed.

³ Many of the cases have been excluded for lack of space. In many the discharge has pyogenic organisms in it. I prefer the term surgically clean.

⁴ This has since been given up.

May 2nd Operation, longitudinal incision made on under surface of heel down to bone, exostosis exposed and chiselled off, wound sutured with catgut Dressing Spirit gauze May 11th Dressing removed, wound healed by first intention, quite dry

Remarks—The excised exostosis as seen in the X ray plate had the appearance of new bone formation following the extruded paste, and suggests stimulation of the bone forming capacity

CASE 8—A private aged 35 Wounded by shell in the right arm about three weeks or a month (he cannot tell the date) before admission He had loss of sensation and movement in his hand A piece of shell was removed from his arm in France On admission to the Northumberland War Hospital, March 9th, 1916, on posterior and internal surface of the middle of the right upper arm was a large, granulating, septic wound, his humerus was fractured March 11th X ray Fracture of humerus $\frac{1}{2}$ inches above elbow, no antero-posterior displacement March 12th Evening temperature, 101.4°F March 15th Bacteriological report Streptococci and staphylococci, 25 organisms present in one field, in film made from pus Culture showed copious growth of staphylococci and lesser growth of streptococci

March 21st Operation, wound cleaned up, explored with finger and slightly enlarged posteriorly Arm put up in flexion and retained there by bandages Tube and gauze drain put into the depths of the wound To be syringed two-hourly with eusol After the operation his temperature rose to 101° , and thereafter oscillated between normal or subnormal and 102.6° (on March 25th) until April 21st March 27th Abscess formed on back of hand, opened April 1st Wound looking cleaner, but very painful, especially on being dressed April 3rd An abscess burst on right wrist in front, discharged pus freely April 6th Arm very swollen, patient complained of a great deal of pain

April 11th Operation (a month after admission) Wound above elbow explored and several pieces of loose bone removed No union of fracture at all Wound opened up and triceps nearly divided across to allow of free drainage Packed with eusol gauze Wrist wound extensively opened up across anterior fold of wrist. Grating felt in wrist joint Incision on back of hand enlarged Condition of arm and hand appeared so bad that an amputation would have been done had permission been obtained Wrist and hand wounds filled with eusol gauze Put up on metal splint with elbow at a right angle

April 15th Patient had been running a temperature each evening Wounds dressed, very septic, much pus Still no attempt at union of fracture, very painful April 19th Dressing taken down under an anæsthetic Two further incisions made on back of hand where abscesses had formed All wounds cleaned, swabbed out with methylated spirit, and filled with "Bipp" Arm put up again on splint April 28th Temperature came down two days after "Bipp" and did not rise above normal again, being on most days slightly subnormal Wounds dressed, very little pus, scarcely any pain, oedema of hand largely gone May 2nd Dressing taken down under an anæsthetic Elbow wound granulating and healthy looking Ends of bone felt to be covered with firm granulations, no union of fracture Wrist and hand wounds quite clean, no grating in wrist-joint All wounds washed with spirit and filled with "Bipp" Arm put up in plaster of Paris with elbow joint fixed at a little less than a right angle, fingers left out

May 29th (27 days after dressing in plaster of Paris) Dressings removed The wound in the thumb fold was quite dry On the dressing covering the wrist was a slimy purulent-looking fluid, but no inflammatory reaction in the wound, which was small, of L shape, and covered with healthy granulations The wound on the back of the hand was covered with dry paste It was about the size of a broad bean, and on removing the adherent paste was covered with healthy granulations All these wounds were re-pasted Elbow There was a lot of dark, greasy, purulent-looking discharge on the dressing The large gap above the elbow had contracted into a narrow sulcus with granulations at the bottom of it. On the outer aspect of the elbow the granulations were about the size of a shilling, and had a cockscomb-like appearance They bled readily On the inner side and posteriorly the wound was all healed, leaving a deep sulcus between the lower part of the upper arm and the forearm There was firm union of the fractured humerus Wounds re-pasted Bacteriological report From elbow, sterile, from hand, sterile June 22nd (between three and four weeks later) Wounds dry and healed, except for a small superficial area of granulations on the flexor aspect of the wrist Now healed

Remarks—I have never before seen an arm so badly infected get better and those of my colleagues who saw it with me entertained no hope of recovery The relief experienced from infrequent dressing was not limited to the patient himself, for he disturbed all the inmates of the ward by his

cries during each dressing, however carefully done The contrast between his temperatures before and after the use of "Bipp" is striking Bone cases occasioned us great trouble before this method was adopted After any operation upon them infection was apt to flare up more necrosis followed further operations had to be undertaken and even if healed, occurred they were likely to return from time to time with fresh abscesses and more sequestra

CASE 9—Private aged 28, wounded on March 10th, 1916, by a shell He did not lose much blood at the time A piece of shell, 1 inch by 1 inch, was taken out of the wound in his thigh at the dressing station on the day he was wounded He was sent down to hospital at L— and was operated upon again—his hand and his thigh A tube was put into his thigh Secondary hæmorrhage from left thigh on boat, Z A N, March 23rd Admitted to Northumberland War Hospital, March 23rd, 1916 Temperature, 93°F on admission, fluctuated between subnormal and 102.2° until March 30th, the daily range then becoming smaller until April 13th Thereafter it was rarely above normal, being mostly slightly subnormal On admission on dorsum of left hand between bases of ring and middle fingers was a granulating septic wound, the size of a thrush's egg Patient could not move ring or little fingers but there was no loss of sensation

April 21st Granulations on hand wound very excessive although caustic had been used Abscess had formed in palm and was opened over inner border of palm, about 1 oz. of pus evacuated X ray Left hand Fourth metacarpophalangeal joint smashed Very large foreign body between fourth and fifth metacarpals and on joint of them A few tiny foreign bodies also May 12th Operation (left hand) Dr Evelyn Ritson Under an anæsthetic it was quite easy to palpate a large foreign body in palm of left hand, anterior to metacarpal bone of ring finger A longitudinal incision was made over this and three pieces of shell were removed It was found that a probe passed into the original wound entered the cavity from which the shell was taken The wound was curetted and the sinus thoroughly cleansed with spirit Both wounds were packed with "Bipp" and the incision in the palm was sutured The incision on the inner border of the palm which was made to open the abscess was not touched, as it appeared to be trivial

May 20th (8 days later) Dressed The lower half of the incision on the palm had healed by first intention No redness from sutures Some iodolorm was oozing from the upper part of the incision The original wound on dorsum was clean and healthy The incision wound on the inner border, which was not pasted, had discharged about 1 drachm of pus, and was still discharging Reddressed with "Bipp" Bacteriological report Staphylococci, one or two colonies on agar May 29th (9 days later) Hand dressed Dressings had a slimy purulent-looking discharge on them Hand itself free from any irritation Palmar wound had opened up to a certain extent and was covered with healthy cockscomb-like granulations June 5th (a week later) Dressed On palmar surface of hand cockscomb like granulations Same on dorsal surface, with crust round it Bacteriological report Staphylococci, Gram positive bacilli June 12th (a week later) Dressed Three bits of bone came out of palmar wound from cockscomb like granulations Very little discharge Upper wound about the size of a split pea, covered with dry paste, which hid a small granulating area June 22nd Dressed Wounds granulating healthily, small amount of discharge A spicule of loose bone was found in the centre of the palmar granulating area later Still small pieces of bone escaping, not healed

Remarks—This patient had had secondary hæmorrhage from his thigh on three occasions and his life was undoubtedly saved by the skill and perseverance of Major C. D Oily Grange, who tied at intervals his common femoral external iliac superficial and deep femoral vessels The special interest of his hand wounds is that the small incision for abscess which was not treated with "Bipp" suppurated freely and the treated wounds scarcely at all

CASE 10—Driver aged 20, injured on May 30th Patient was riding on horseback when a passing motor skidded and ran into him, squeezing his leg (left) between the saddle and the motor and fracturing it He stated that his leg was also cut by the saddle and the bone protruded On admission to Northumberland War Hospital, June 4th 1916 Left leg was on back splint with foot piece Two inches above internal malleolus was a large oval, very septic, sloughy wound 4 by 3 inches, vertical in its long direction, with muscles exposed also bare bone for 3 inches about centre of wound, $\frac{1}{2}$ to $\frac{1}{4}$ inch across Foot exerted leg painful X ray showed fracture of tibia and fibula just above ankle

June 6th, 1916 Operation Wound covered by mop wrung out of 1 20 carbolic Skin cleaned up with the same, then wound cleaned with sterile gauze followed by methylated spirit Ends of bone curetted, no sequestra

found. Ends of bone placed in good apposition. Wound filled with "Bipp," and this was also rubbed on ends of bone. Thick catgut sutures in skin, but skin not approximated, because this could not be done on account of inflammatory swelling. Sutures purposely very tight. Dressing Spirit gauze, back splint applied.

Radlogram of a recent fracture of tibia. (Case 10) Wound filled with "Bipp." Note that none of it had reached the fibular fracture.

was no swelling, redness, heat nor pain, and the wound was covered with healthy granulations. Re-pasted. Next day the leg was put into a plaster-of-Paris bandage and has been left there, as the patient is well and comfortable.

Remarks—The X ray photograph in this case because the fractured fibula shows no "Bipp" and clinical evidence in others suggest that the zone of action of "Bipp" extends for a considerable distance beyond the site of its implantation.

CASE 11—Corporal aged 21. Note from France "Gun shot wound (severe) left arm. Fractured humerus (severe). Wounded May 20th by machine gun bullet. Pieces of bone removed at H— and E— Stinking pus from wound. No damage to musculo-spiral nerve." Transferred to Professor Morison (Ward 3-5) June 6th 1916. On admission 2 inches above left elbow joint posteriorly was a granulating wound over middle of triceps with pus coming from the depths through it. Two silkworm gut sutures which had cut the skin were still in position in the deep parts. On back of arm wound measured 3 by 2 inches. On outer side of arm was a granulating wound which communicated with the other, size of a florin. Fracture of lower end of humerus, not extending into elbow joint.

June 6th Operation. Wounds covered by wool soaked in 1:20 carbolic. Skin all round cleansed by same. Silkworm sutures removed. Inner and outer wounds explored with finger. Ends of fractured bone felt also several loose pieces which were removed. Wounds opened up by cutting through supinator longus and outer part of triceps and cavity cleaned and dried—first with sterile gauze, then spirit gauze and finally packed with "Bipp." Wounds sutured with interrupted thick chromicised catgut through muscles and skin. Dressed with spirit gauze. Two short Gooch splints for upper arm and angular splint of aluminium applied to antero-internal surface. Temperature rose to 101.4° F on the 7th, but did not exceed 99.6° after this (8th and 10th).

June 22nd First dressing at demonstration—16 days after operation. The patient had not complained of any pain after the first night. Discharge had appeared through the dressings which were pickled with spirit and undisturbed. There was a quantity of dirty looking, slimy discharge in the dressing and over the wound and skin. There was no sign of inflammation and the greater part of the incision wound had healed. The catgut sutures were still present and had caused no irritation. Removal of the dressing and splints caused no pain. The arm could be lifted by the elbow without causing pain, and careful testing showed that there was already union of the fracture. June 30th The patient has been so well and comfortable that the dressing has not been touched. It is now almost healed.

Remarks—After these experiences with fracture it seems justifiable to expect that compound fractures may be so treated as to cause as little trouble as simple ones do. The only reason for moving the dressings in these cases was to see how the wounds looked. Men at the front dealt with in this way need never be dressed during their transport or till they reach the position which would give them the best chances of further treatment.

CASE 12—Sergeant aged 27, wounded on May 24th by hand grenade in both arms. Operated upon in France on May 25th, and wounds cleaned up. Admitted to Northumberland War Hospital June 2nd, 1916. On admission Right arm Over radial side of right wrist was a small granulating not very septic wound. Left arm On flexor surface of fore arm, wrist, and part of hand, more to ulnar side than radial, was a longitudinal irregular wound granulating and septic, 3½ by 1½ inches, with sloughy muscle exposed at bottom of it. In upper part of forearm, flexor aspect and external, extending from the elbow joint downwards, was a longitudinal irregular wound, 3 by 1½ inches granulating and septic.

June 3rd Skin and wounds cleaned. Dressed with "Bipp" spread on spirit gauze as butter is on bread. Bacteriological report Staphylococci and streptococci breves. Temperature 99° F on June 2nd, was normal on the 4th, and did not rise again. June 3rd X ray Left arm. No fracture seen, many foreign bodies. Right arm Small foreign body in front of bones. June 22nd Wounds dressed for first time. Dressings left undisturbed for 20 days. No discharge through, no pain. Wounds and surrounding skin covered by slimy discharge. No sign of inflammation present, wounds clean, healthy granulations. Edges covered by a rim of actively growing epithelium. Now healed.

Remarks—This case was exhibited to show the effect of treatment on superficial as compared with deep wounds, and it does not offer strong support to a belief in anaerobic agencies. It also shows that active healing processes occur in portions of the wound in contact with the antiseptic employed.

CASE 13—Sapper aged 36, wounded on April 19th, 1916, by shrapnel. Note from France "Gunshot wound right knee, fracture internal condyle femur, tear in popliteal artery, knee joint perforating. X ray Comminution internal condyle, two pieces of metal in knee. April 24th Amputation, flaps—closure attempted—gave way." On admission to Northumberland War Hospital June 2nd 1916. Right thigh had been amputated through its middle by anterior and posterior flaps. Between the two flaps was a large oval, granulating surface, size of an orange, protruding beneath which could be felt the end of bone. Bacteriological report Staphylococci and streptococci breves.

June 6th Operation. Two abscesses had formed on anterior aspect of stump, about 3 and 4 inches above end. These were opened, curetted, cleaned, and filled with "Bipp." Flaps dissected up, and about 2½ inches of bone removed. Vessels clamped with Lane's forceps and not tied. Medulla scooped out and packed with paste. Flaps packed with two strips of spirit gauze, spread on both sides with "Bipp," one end of each strip protruding from either end of the wound. After being smeared with paste, flaps brought together with three strong sutures of catgut and skin approximated with further catgut sutures. Dressed with spirit gauze. June 7th (next day) Little blood staining through dressing. Patient very comfortable. Less pain in stump than before operation. Temperature above normal only on 7th (99.4° F) and 8th (99.2°). June 9th Dressed, as dressing had slipped loose. Wound looked quite clean, no inflammation. June 15th (6 days later) Patient had not been sleeping well. Was slightly delirious, but looked all right. Gauze packing removed from stump. June 17th Dressed, stump looking well, re-pasted. June 22nd Small amount of discharge on dressing. Thick catgut sutures still holding and causing no irritation. Wound almost healed. Now healed.

Remarks—I probably made a mistake in putting gauze between the flaps. They prevented the wound from closing and apparently did no good. But our experience of

re amputation has warned us to expect so frequently a bad septic "flare up" and breaking down of the wound that I was afraid to close this without providing for free drainage. His temperature chart after the operation suggests that these fears were groundless.

CASE 15—Private aged 26. Note from France "Fractured skull, left parietal, gunshot wound. Decompressed at C.C.S. Had choked disc on admission, double. Partially blind now. Developed meningitis, cell count 190,000, fluid not under pressure, cleared up in five days." On admission to Northumberland War Hospital May 1st, 1916. Patient was dazed and could not remember anything, slightly deaf in left ear, aphasic. There was a septic, pulsating, freely suppurating hernia cerebri the size of a hen's egg, immediately above the left ear. Dressed twice daily till May 6th. The temperature throughout was slightly subnormal (highest 98.6° F., lowest 97.4°). May 2nd. Condition much the same, complained of headache. May 5th. Hernia cerebri looking more swollen, patient comfortable, temperature normal. May 6th. Hernia dressed with "Bipp," spread on boris lint. May 13th (7 days later). Hernia dressed for first time. Decreased in size by two-thirds, and patient much brighter. Hernia much cleaner. May 15th. Little discharge from wound. Packed with spirit wool and not redressed. May 16th. Memory better, patient still a little aphasic is deaf still in left ear.

May 20th. Hernia dressed again, almost flat. A little purulent slimy fluid on skin round dressing, and also a very little lying in one sulcus. Bacteriological report: Staphylococci and streptococci, fair amount of growth on agar. May 26th (6 days later). Dressed. There was a layer of purulent-looking fluid covering the centre and lower part of the granulating area which was the cerebral hernia. The pulsating granulations forming the cerebral hernia were now rather below the level of the scalp wound. There was no discharge through the dressing. June 2nd (a week later). Dressed. Wound rapidly contracting—size of a shilling and granulations were level with surface of scalp. Looked healthy, but there was a small quantity of pus in centre of granulating area. Bacteriological report: Staphylococci and streptococci breves. Only two colonies on agar. June 12th (10 days later). One small place in middle of scar not quite healed over, wound dry, paste still in. June 22nd. Dressed. Wound covered with dry paste. When this was wiped off with spirit there appeared to be a pin head area of granulations under it. Now healed.

Remarks—I have never seen a hernia cerebri heal as this did. Under whatever form of treatment they have always discharged for a long time and have generally caused serious trouble. It is possibly additional evidence against the anaerobic effect of "Bipp."

Conclusions—1. The treatment of septic wounds in the manner described makes possible healing by "first intention" under infrequent dressings and without drainage further than that allowed for through gaps left by interrupted sutures. 2. Acute abscesses opened, cleaned, filled with "Bipp," and closed by interrupted sutures can heal by "first intention" without further pus formation. I have proved this. 3. It appears to be safe to plate compound fractures by adopting the method described. This has been done by my colleagues, Dr Samuel Whyllis and Major D Oyley Grange. 4. As up to the present time no bad results have been observed to follow this method it should have a fair trial in the Navy and the Army without delay.

I am indebted to Colonel Adams for leave to publish these case notes.

Newcastle-upon Tyne

THE LATE DR H B FLEMING—The death took place on August 5th, at his residence, Campsie House, Omagh, after an illness of some months, of Dr H B Fleming, one of the most prominent and successful medical practitioners in co Tyrone. Dr Fleming who was the son of an Omagh medical man, studied in Dublin and graduated M.B. of Trinity College in 1876. He was also a Licentiate of the Royal College of Surgeons in Ireland. Beginning practice in Omagh, he was for 39 years medical officer of the Omagh board of guardians, having succeeded his father in the medical officership of the dispensary, but he gave up that appointment when elected medical attendant of the union workhouse and hospitals. Dr Fleming was married and three of his sons, all connected with the medical profession are serving with the colours. At a meeting of the Omagh board of guardians held on August 5th a vote of sympathy with Mrs Fleming and her family was passed. Dr Fleming who had a large practice was greatly respected by a very large clientele.

AN ANOMALY IN THE WIDAL REACTION

By A F S SLADDEN, M.D. OXON.,
TEMPORARY CAPTAIN R.A.M.C. BACTERIOLOGIST AT A STATIONARY HOSPITAL.

In the course of a large number of routine examinations of the Widal reaction in the bloods of patients suspected of enteric group infections, the standard method of Dreyer being employed, attention was repeatedly attracted by the occurrence of "zone phenomena"—i.e., the occurrence of agglutination in higher dilutions of a serum, while the lower ranges of dilution failed to agglutinate the bacillus. This zone phenomenon has been described before now, but, so far as can be gathered from text-books, it has not yet received any satisfactory explanation. Having no reference library available in present circumstances, it has not been possible to look up past observations on the subject, so that the following notes, though original to the writer, may well be repetitions of previous work. However, even if redundant they may be worth recording, especially as they have some practical importance in respect of the diagnosing of paratyphoid A infections, and perhaps also in other directions.

The zone phenomenon occasionally appears in Widal tests done by the microscopic method, but it shows itself in a much more striking manner when the macroscopic method of Dreyer is used. In this method killed cultures of the three members of the typhoid group B typhosus, paratyphoid A, and paratyphoid B, in formalinised broth are used the organism having been previously repeatedly subcultured in a special broth medium until it has reached a maximal degree of agglutinability. In Dreyer's technique a constant volume of emulsion is used in each tube and the dilution of serum is so arranged that in each tube the final volume of fluid is the same. The diluting fluid used for adjusting the volume is normal saline solution. The test is carried out at a temperature of 50–55° C. in a water bath for a period of two hours and in this time it is found as a rule that the limit of agglutination is reached. Thus the factors of time and temperature are standard and practically optimal, the bacillus used is at its highest attainable degree of agglutinability and therefore also optimal, the fact that the culture is killed and retains its properties unaltered for about three months also standardises results, while the constant volume of fluid (containing sodium chloride as normal saline) renders all results obtained comparable with each other and with past observations.

The occurrence of negative zones when other types of bacillary emulsion are used is well known. Ledingham and Penfold¹ give two such instances with sera tested against emulsions of living paratyphoid B organism suspended in half normal saline. In my experience also the zone effect was obtained when testing the serum of a patient against paratyphoid A isolated from the blood of the same case and growing in broth. This patient's serum was tested on three occasions against standard paratyphoid A emulsion but with results entirely negative.

TABLE I

Serum (Patient T)	Bacillus (Patient's own)	Dilutions of serum					
		1:3	1:6	1:12	1:25	1:50	1:125
10th day	Para. A Standard para. A	—	—	—	+	++	+
16th day		—	—	—	—	—	—
22nd day		—	—	—	—	—	—

Explanation of signs in tables: — Not tested; — no agglutination; + = definite agglutination; ++ = well marked flocculi; +++ = sedimentation of flocculi.

This may have been due to an extensive inhibition zone associated with the nature of the standard bacillary emulsion or to other causes unknown. The possibility that by their mode of preparation the standard emulsions are especially susceptible to zone effect cannot be overlooked although the phenomenon is primarily a property of the serum.

Following Dreyer's technique a negative zone was noticed in many instances no fewer than 35 such zones being found

in examining sera from 116 different patients. As in many instances the tests were started at fairly high dilutions (1:25, 1:50 for B typhosus), it is probable that many more zones could have been detected had lower dilutions been tested, notably in the case of B typhosus, for the sera being without exception those of inoculated patients economy of time and material indicated starting tests at 1:50 or 1:125 dilution, whereas the negative zone does not often extend so far upwards. Even so, negative zones observed were distributed thus on the average —

TABLE II.

Bacillus	No. of zones	Average extent.
B typhosus ...	9	To 1:50 serum dilution
Para. A ...	8	To 1:12
Para. B ...	18	To 1:80

It was, moreover, not uncommon for the range to be even wider—for example, B typhosus to 1:125, paratyphoid A to 1:25, and paratyphoid B to 1:125 serum dilution, at which dilutions agglutination became apparent. It did not often happen that all three bacilli were tested out in very low dilutions, but in instances where agglutination occurred with all three and a zone effect was seen in one variety further observations showed that a zone phenomenon was present for all three and the extent of the zones also varied in about the same proportions as given above in the average figures. In other words, the zone of inhibition is not so specific to each variety of bacillus of the group as is the property of agglutination, it is probably a group reaction exerted upon all members of the typhoid group, though with varying intensity.

The presence of a negative zone with all three varieties of the typhoid group is shown in the following table of tests made with the serum of a patient (A.S.) diagnosed serologically as having paratyphoid B with possibly paratyphoid A superadded, the tests being made with serum taken on twenty-seventh day of illness.

TABLE III.

Serum dilutions	1:4	1:5	1:12	1:25	1:125	End point.
B typhosus emulsion	—	—	+	++	---	1:2,500
Para. A emulsion	—	—	+	++	---	1:2,500
Para. B emulsion	—	—	—	+	++	1:25,000

From the greater prevalence of paratyphoid B infections combined with the much more decided manner in which this bacillus agglutinates as compared with paratyphoid A a greater number of negative zones with paratyphoid B.

TABLE IV.—Serum of Sergeant A with Mixed Infection of Paratyphoid A and Paratyphoid B, Collected on the Thirty-first Day of Illness (Jan. 31st, 1916)

Date	Emulsion.	Dilutions

	19th	Para. A	—	—	—	—	—	—	—	—	—	—	1:80
T.	10th	Para. B	—	—	—	—	—	—	—	—	—	—	1:2500
	16th	Para. B	—	—	—	—	—	—	—	—	—	—	1:2500
F.	About 1st	Typhosus	—	—	—	—	—	—	—	—	—	—	1:50
	16th	Typhosus	—	—	—	—	—	—	—	—	—	—	1:2500

might be expected and the general tendency for such zones to be wider also renders their recognition in routine work more likely. On several occasions there was evidence to

show that the zone effect tends to diminish when the serum is kept *in vitro* for two or three days, an example of this, taken from six such observations, is given in Table IV. On the other hand, the extent of the negative zone does not diminish but rather tends to increase with the progress of the illness. This is shown in Table V.

Other examples bearing out this property could be given. If, moreover, in the whole series of cases the extent of zone observed be compared with the day of the disease on which the serum was drawn, it becomes quite evident that when negative zones occur they tend to become wider as the illness progresses. This is shown in the following table —

TABLE VI

Emulsion	Extent of zone.	Total cases	Average day of disease
B typhosus ..	to 1:125	1	62
	1:50	2	18
	1:25	3	15
Para. A ..	to 1:50	1	65
	1:12	2	29
	1:6	2	23
Para. B ..	to 1:125	6	34
	1:50	8	23

In identifying bacilli of the typhoid group by their agglutinating properties with specific sera by the hanging-drop method, the use of distilled water instead of normal saline for the making of bacillary emulsions and serum dilutions is quite satisfactory. It seemed, therefore, worth investigating the effect of replacement of normal saline as diluting fluid by distilled water.

In Muir and Ritchie's "Manual of Bacteriology" is quoted the experience of Bordet and of Joos that the presence of some sodium chloride is necessary for agglutination. Although the actual proportion necessary is not stated it is evident that it need not be so high as that in normal saline (0.85 per cent.) and the following experiments show that the addition of sodium chloride beyond a certain point (which lies below 0.85 per cent.) tends, in many cases at any rate, to encourage the production of a negative inhibition zone, and probably also to lower very slightly the end point dilution at which agglutination ceases.

In Dreyer's standard method the fluid in each tube consists of 60 per cent of bacillary emulsion (15 drops in 25) and as this emulsion contains over 0.5 per cent sodium chloride there is no lack of the latter from this source alone to ensure agglutination.

Experiments were made with agglutinating sera that had shown a definite negative zone when tested strictly according to Dreyer's method, using normal saline as diluent. In such instances parallel sets of tubes were put up in the first set with normal saline as diluent, the second distilled water. In other respects there was strict adherence to Dreyer's technique.

TABLE VII

No.	Patient	Emulsion.	Diluent.	Serum dilutions.					
				1:12	1:25	1:125	1:500	1:2500	1:5000
1	Sgt. A.	Para. B	Saline Water	—	—	—	—	—	—
2	Wms.	Para. B	Saline Water	—	—	—	—	—	—
3	H.	Typhosus	Saline Water	—	—	—	—	—	—
4	W.	Para. A	Saline Water	—	—	—	—	—	—
5	Rob.	Para. A	Saline Water	—	—	—	—	—	—
6	Roy.	Para. A	Saline Water	—	—	—	—	—	—
7	Wr.	Para. A	Saline Water	—	—	—	—	—	—

The above series of tests carried out strictly on parallel lines affords definite evidence that replacing normal saline as diluent by distilled water causes a diminution in the inhibition zone. Incidentally the extension of the end point which occurs when distilled water is used is clearly seen,

notably in Cases 3, 4, and 6 above, and the following table gives other observations which bear on this extension

TABLE VIII

No	Patient	Emulsion.	Diluent	Serum dilutions			
				1:50	1:80	1:125	1:250
1	F	Para. B	Saline	++	++	+	—
			Water	++	++	++	+
2	T	Para. B	Saline	1:12500	1:25000	1:50000	—
			Water	+	—	—	—
3	D	Typhosus	Saline	1:50	1:80	1:125	1:250
			Water	++	++	++	—
4	H	Typhosus	Saline	1:12	1:25	1:50	—
			Water	++	++	++	—
5	W	Para. A	Saline	1:12	1:25	—	—
			Water	++	—	—	—
6	R	Para. A	Saline	1:6	1:12	1:25	1:50
			Water	++	++	++	+

In many other cases the same tendency was seen, and no instance occurred in which a "normal saline" end point extended further than a "distilled water" end point. The observations recorded make it clear that the use of normal saline as diluent, while not the cause of the zone phenomenon, is at least auxiliary to its production.

A few tests were made to ascertain the part played by serum in the production of a negative zone. The replacement of a certain proportion of the diluting fluid by a human serum which had proved to be non-agglutinating to the bacillus under observation was tried. In each instance this added serum was derived from a patient inoculated against typhoid but not suffering from a typhoid group infection. In the sequel this added serum is denoted as "foreign serum."

TABLE IX.

No	Patient	Emulsion	Diluent	Serum dilutions			
1	A	Para. B	Saline	1:12	1:25		
			16% foreign serum and saline	++	++		
2	Wms	Para. B	Saline	1:12	1:25	1:50	1:125
			Water	++	++	++	++
			8% foreign serum and saline	++	++	++	++
			8% foreign serum and water	—	Trace	+	+

The above series show that in presence of normal saline diluent the addition of as much as 8 per cent of foreign serum completely inhibits agglutination and that this inhibition is less strongly exerted when the salt content of the system is reduced.

The influence of varying proportions of foreign serum on agglutinating serum was also tested. The serum of a patient, Wms (No 2 in Table IX) which agglutinated Paratyphoid B from 1:50 to 1:2500 dilution, was tested at a constant dilution of 1:25 with Para. B emulsion and rising proportions of foreign serum. The degree of agglutination in each test is recorded on the usual system.

TABLE X

Diluting fluid	Percentage foreign serum added			
	0	2	4	8
Normal saline	++	++	+	—
Distilled water	+++	+++	++	+

This bears out the previous experience and shows that with 4 per cent or more of foreign serum added an appreciable degree of inhibition takes place which is diminished but not destroyed by the use of distilled water as diluent.

Three different "foreign sera" were used in these three different experiments, and the results suggest that possibly all sera if present in about 4 per cent. dilution or more tend to inhibit agglutination or in other words, that the cause of inhibition is always present but in certain cases it is overcome by the agglutinating power of the serum entirely, in

other cases only partially, in the latter circumstance the "zone phenomenon" appears. The occurrence of the zone up to or beyond a serum dilution of 1:25 (4 per cent.) is thus not surprising and the tendency found for the negative zone to extend in the later weeks of an illness may be associated with the gradual fall of agglutinating power from the maximum. No relationship between the extent of the zone and the distance of the end point has been detected, except in so far as both zone and end point are smallest in more paratyphoid A tests and most extended in paratyphoid B cases.

In view of the results recorded it seems quite possible that in cases where agglutinating power is not strong and the inhibiting power native to the serum is well developed, the presence of agglutination may easily be passed over. This possibly would be greatest in paratyphoid A infections or in the early stages of a paratyphoid B infection. The following notes illustrate this point, in all cases normal saline was used as diluent.

TABLE XI

No	Patient.	Day of illness	Emulsion.	Serum dilutions.					
1	K.	26	Typhosus	1:3	1:6	1:12	1:25	1:50	1:125
2	H	18		—	—	—	++	—	—
3	B	11		—	—	—	+	—	—
4	M	17		—	—	—	—	+	—
5	F	10		—	—	—	++	—	—
6	W	21	Para. A	—	+	+	—	—	—
7	R	11		—	+	—	—	—	—
8	E	?	Para. B	—	—	—	+	—	—

In each of these the "positive zone" of agglutination is comparatively narrow, and the possibility of more extreme cases has to be borne in mind.

Another instructive case from this standpoint was seen in a series of tests made on the serum of a man who received mixed vaccine (T.A.B.) in November, 1915. This was examined four times in February, when the patient (Wf) was under suspicion for enteric. The details of tests made with paratyphoid A were as follows, normal saline being used as diluent.

TABLE XII

No	Date of test	Serum dilutions					
1	1-2-16	1:3	1:6	1:12	1:25	1:50	
2	10-2-16	—	—	—	—	—	
3	16-2-16	—	—	—	++	++	to 1:500
4	21-2-16	1:125	1:250	1:500	1:1250	—	—

The conclusion drawn from the above series was that the agglutinating power for paratyphoid A of high degree must have been present in all four samples of serum, but that on the first two occasions all the dilutions tested were within a negative zone, and so the agglutinating power of the serum was missed. The case of T (Table I), quoted early in this paper, may also be interpreted in this sense.

In view of these experiments the importance of the zone phenomenon and its frequency as a disturbing influence in agglutination tests done by Dreyer's standard method seems established. In order therefore, to diminish this effect as much as possible the use of distilled water as diluting fluid instead of normal saline has been initiated by the writer in his routine work. No practical objections to its use have been discovered, nor is the sharpness of the end point impaired. It is not claimed that the operation of the zone effect is thereby annulled but that it is diminished and the agglutination test rendered distinctly more delicate without becoming more complicated.

When, as at an infectious hospital, a large number of sera have to be tested daily economy of time labour and bacillary emulsion are all desirable and from this standpoint also this modification is advantageous. It has proved satisfactory in operation and judging from 19 zone effects noted among sera from 42 patients there is a definite diminution in

he extent of the zone. This is shown in Table XIII, which should be compared with Table II

TABLE XIII

Bacillus	No of zones	Average extent	Highest observed
Typhosus ..	3	To 1 30-	To 1 50
Para. A	6	1:12	1 25
Para. B	10	1:40	1 50

In paratyphoid A infections the agglutinating power of the serum usually develops early, but does not rise to much height, nor does it persist for long frequently. Consequently the chances of detecting the infection by agglutination tests may be but small, and the possibility limited to a few days. Probably with the other two members of the group, B typhosus and paratyphoid B, the interference of zone effect has less practical importance but a perusal of Table XI shows that the effect is by no means negligible in any one of the three members of the group.

Apart from any immediate application, a further study of the phenomenon may help to cast more light on the interactions of serum with invading organism in an infected subject. No attempt to promulgate a theory of the phenomenon is here made. A suggestion that the inhibiting action may be a bacteriolysis exerted by the serum when present in sufficient strength (2 per cent or more) was considered and a few simple tests made with inconclusive results. The balance of evidence being against the theory of lysis, for in several instances where zone effect was seen the negative tube still contained plenty of free bacilli of unaltered morphology.

The observations and conclusions recorded are of necessity very simple, and under stress of much routine work there has been no opportunity of investigating effects of temperature or other aspects of the subject.

Needless to say, if this modification of Dreyer's method is used it is desirable to adhere consistently to the use of distilled water as diluent in order to get comparable results. In this way the very valuable information to be gained by the method is increased.

No conclusions have been possible as to the importance of a zone effect on the course of the illness. All that can be said is that the majority of cases with zone effect were mild or fairly mild in character, none died nor was zone effect seen in certain severe cases. While, therefore, one is justified in regarding the phenomenon as not of bad omen, it has yet to be proved a favourable prognostic.

It seems possible that the whole phenomenon may be associated with inoculation. All the zone effects observed were in men inoculated against typhosus (and in two cases I.A.B. vaccine) within 18 months, nor was any zone effect noted in four cases of uninoculated men who came under investigation. In this connexion also it is noteworthy that in the experiments with added "foreign" serum the latter was derived in every instance from an inoculated man and had typhosus titre ranging from 1 50 to 1 250.

Summary

1 In following Dreyer's standard method of agglutination testing for suspect enteric cases in the lower dilutions a negative (inhibition) zone is very frequently seen. This is not peculiar to Dreyer's method.

2 A feeble agglutinating power if opposed by a well marked inhibition zone, may only be visible over a short range of dilutions, and unless a large number of dilutions be tested the presence of agglutinin may be missed.

3 In the experiments recorded here the sera have been those of subjects inoculated against B typhosus within 18 months.

4 Addition of another serum non agglutinating to the bacillus under test, will increase the zone of inhibition.

5 The presence of sodium chloride in the test augments but does not cause the negative zone.

6 By using distilled water as diluent in place of normal saline the negative zone is diminished and the test rendered more delicate.

7 The zone effect is exerted upon all three members of the typhoid group but in varying degrees. Its extent tends to increase with the progress of the infection.

8 No definite relationship between zone effect and clinical aspect is established but the inhibition zone does not appear to be of unfavourable omen.

THE EFFECT OF TYPHOID INOCULATION ON ENDEMIC GOITRE AT THE LAWRENCE MILITARY ASYLUM, SANAWAR, PUNJAB

By M. A. NICHOLSON, M.R.C.S., L.R.C.P. LOND.,
CAPTAIN INDIAN MEDICAL SERVICE.

McCarrison has suggested that endemic goitre is due to an infection by an organism which is probably of intestinal origin and water borne. On this hypothesis he has treated cases of endemic goitre with vaccines prepared from various organisms and has claimed considerable success, especially with vaccines prepared from intestinal organisms.¹ While holding the appointment of medical officer to the Lawrence Military Asylum, Sanawar, it occurred to me after reading McCarrison's work to inquire into the effect of a powerful vaccine prepared from an intestinal organism, such as typhoid, on the goitre prevalent in the asylum. The conditions for pursuing such an inquiry were particularly favourable.

The Lawrence Military Asylum was founded by Sir Henry Lawrence in 1848 to serve as an asylum for the children of British soldiers in India from the fierce heats of the Indian plains and the still fiercer temptations that surround children in barrack life in India. The asylum is situated on Sanawar Hill at an altitude of 5500 feet, at a distance of three miles from the cantonment of Kasauli. It provides accommodation for 500 children, there being nearly equal numbers of each sex. The ages run from 3 to 20 years, and in consequence of the fact that many of the children are orphans and of Indian conditions many of the children spend 6 to 10 years in the asylum. The earliest records of the asylum note the incidence of goitre amongst the wards. By 1899 the disease had apparently become so prevalent that when in that year the supplementing of the spring water supply with rain water became necessary owing to the partial failure and drying up of the spring, it was specially arranged that the scheme should involve a dual supply of spring water for washing purposes only and rain water for drinking and cooking. One of the objects that it was hoped to obtain by this adoption of a dual system was a decrease in the goitre prevalent. To ascertain if any progress was being made to this end the Inspector General of Civil Hospitals of the Punjab instituted a quarterly return of the names of all wards suffering from enlargement of the thyroid gland from Oct 1st, 1899.

Unfortunately, the original object of the dual water-supply and of this return was soon lost sight of, for after a very few years the separation of the rain water supply for drinking and cooking only and the spring water for washing was discontinued. The return, on the other hand, was still, and I believe is still regularly submitted. This return affords a complete record of every case of goitre occurring in the asylum since Oct 1st 1899.

In June, 1900, a large proportion of the wards were inoculated for typhoid fever and a careful record of their names kept. The vaccine used was the ordinary typhoid vaccine provided for the use of the British Army in India and was administered in two inoculations, in doses appropriate to the age of the child, at intervals of ten days. In October and November, 1913 the majority of the wards were again inoculated for typhoid fever. The vaccine used was that prepared and issued by the Central Research Institute Kasauli. It was administered in two inoculations at intervals of ten days or a week, in doses appropriate to the age of the child, according to the printed instructions issued with the vaccine by the institute. We have thus the unique opportunity of dealing with a considerable community subject to endemic goitre who are under medical supervision and in whom the fact as to whether they are goitrous or not is carefully recorded every quarter by a medical man.

This community was inoculated at intervals of 13 years in the routine manner against typhoid, the inoculation on each occasion affecting a large proportion of the population but in each case leaving sufficient non inoculated to act as controls. By making out cards for each ward and entering thereon the requisite facts it was an easy though laborious task, by sorting the cards under various headings fully to

¹ THE LANCET Feb 8th, 1913, p. 369

analyse the case of any ward present in the asylum on any given date

Table W shows such an analysis applied to the wards present in the asylum in June, 1900. It will be seen from this table that the percentage of wards present in June, 1900, who became goitrous at any time is the same, or practically the same in the two groups, inoculated and non inoculated, being 48.1 and 48.0 respectively. There is,

TABLE W.—An Analysis of all the Available Cases of all Wards present in the Asylum in June, 1900, and Classified according to whether they received inoculation or not, and with regard to the Date of Inoculation to the First Report of their being Goitrous

	Inoculated	Non inoculated.
Total number of wards present in June, 1900 whose cases were analysed	189	250
Number of these cases which were returned at any time as having been goitrous	91	120
Number of these cases which were returned as goitrous before the date of inoculation	46	57
Number of these cases which were returned as goitrous after the date of inoculation	45	63
Percentage of wards returned as goitrous at any time	48.1	48.0
Percentage of wards returned as goitrous before date of inoculation	24.3	22.8
Percentage of wards returned as goitrous after date of inoculation	23.8	25.2

however, in those who only became goitrous after the date of inoculation a slightly higher percentage affected in those who were non inoculated. While in the case of those who only became goitrous before the date of inoculation the percentage affected is slightly higher in those who subsequently were inoculated. This might be taken to prove that the typhoid inoculation had a slight prophylactic effect in that the group of those inoculated were slightly more liable to goitre before the date of the inoculation, but after inoculation their liability slightly decreased. But it must be remembered that the figures dealt with are very small, and that a further and closer analysis of the cases does not bear out this proposition at all.

Table X shows yearly the number of fresh goitres occurring in the wards in individuals who were present in the asylum in June, 1900, and who were then, and who had been up to that time, unaffected. It will be seen that in the earlier years after the date of inoculation there is, if anything, a higher percentage of goitres occurring amongst those who were inoculated as compared with those who were not. The non inoculated group of Table W make up their higher percentage by cases occurring in the later years after 1900, years in which it is improbable that the inoculation could carry any influence.

TABLE X.—An Inquiry into the Prophylactic Effect of Typhoid Vaccine on Endemic Goitre

Taking the cases of all wards present in the asylum in June, 1900 who were reported as goitrous only at a date subsequent to the date of typhoid inoculation, and the number of these reported in each year after the inoculation

	After—								
	1st year	2nd year	3rd year	4th year	5th year	6th year	7th year	8th year	9th year
No inoculated	4	0	5	5	11	17	1	2	0
No. non inoculated	6	0	6	1	19	24	1	5	1
Percentage inoculated	8.9	0	11.1	11.1	31.4	37.7	2.2	4.4	0
Percentage non inoculated	9.5	0	9.5	1.3	30.1	36.0	1.5	7.9	1.5

Table Y is an attempt to analyse the curative action if any, of the typhoid inoculation of 1900 by taking the cases of all wards present in the asylum in June, 1900, who had already been reported as goitrous before the actual date of inoculation and showing the number of these who cease being reported goitrous in each year subsequent to 1900. It will be seen in this case that, taking the earlier years after the date of inoculation there is if anything a larger percentage of cases ceasing to be reported goitrous amongst those who had not been inoculated than amongst those who had been. The inoculated group of Table W owe their higher percentage to cases occurring in the later years from

1900, when it is improbable that inoculation could have carried any effect.

TABLE Y.—An Inquiry into the Curative Effect of Typhoid Vaccine on Endemic Goitre

Taking the cases of all wards present in June, 1900, who had been reported as goitrous before the date of the inoculation and who subsequently ceased being reported as goitrous in the year between—

	June and June	1900	1901	1902	1903	1904	1905	1906	1907	1908	1909	1910	1911
No inoculated	20	3	2	1	3	7	2	1	0	0	0	0	0
No non inoculated	26	3	7	3	0	5	3	1	0	1	0	1	1
Percentage inoculated	51.3	7.4	5.1	2.7	7.4	18.0	5.1	2.7	0	0	0	0	0
Percentage non inoculated	54.9	5.9	13.7	5.8	0	9.5	5.8	1.9	0	1.9	0	1.9	1.0

From the above tables it is possible to conclude that taken collectively the typhoid inoculation of 1900 had no influence either for or against the goitre prevalent in the asylum. The tables also show some indication of the fallacies that are liable to be fallen into in an investigation of this kind if large numbers are not analysed or the analysis is not carried out very closely.

There remains the inoculation carried out in 1913. My appointment only being for two years, it was obviously impossible to carry out observations on these inoculations over a long period. Further, the boys' department, or a little over half the asylum, was the subject of another experiment to ascertain the result of a bacteriologically clean water supply on the incidence of goitre, and was therefore beyond

TABLE A.—Comparison of the Weekly Measurements of the Necks of Girls suffering from Goitre who were either Inoculated or Non inoculated for Typhoid

Inoculated									
Cases.	Original measurement	First dose	End of first week	Second dose	End of second week	End of third week	End of fourth week	End of fifth week	End of sixth week

Black figures = Decrease from original measurement
Italics = Increase from original measurement
Ordinary = No increase or decrease

All measurements were taken at the same time—i.e., 10 A.M.—with a metal tape-measure over silver nitrate mark of largest circumference and recorded in centimetres.

the pale of my inquiry. I therefore decided to judge the results of the inoculation by direct measurements of a number of goitres from amongst the goitrous girls inoculated.

controlled by measurements of the goitres of goitrous girls inoculated. The girls were all measured the day before the date of inoculation, and at intervals of two three days subsequently for a period of six weeks wards the end of this time the attendances, which are voluntary, not unnaturally became somewhat irregular especially as no very striking result occurred to stimulate interest. The measurements were taken at the same time, A.M., under as equal conditions as possible. Measurements were taken with a metal centimetre tape over the greatest circumference, which was marked with silver nitrate ensure the same circumference being taken each time. Table A shows the result. It will be seen that there are certainly many decreases in the neck measurements after inoculation, but that there is an equal amount of decrease to be noticed amongst the neck measurements of the non inoculated. In each group there are cases of an increase instead of a decrease and in each group there are many stationary cases. In other words taken individually the inoculation for typhoid of 13 had no effect on the cases of goitre occurring amongst the girls of the asylum.

The table also well illustrates the danger of drawing conclusions on a series of cases without comparison of controls. If there had been no controls to the inoculated group of Table A, the inference would have been that the typhoid inoculation had had a curative effect. It now only remains to explain why there was this marked decrease in goitre all round in 1913. That it was not due to the inoculation is obvious as the decrease is equal to those not inoculated as well as those inoculated. The girls were all using the same water supply that they had been doing

TABLE B.—Showing the Relapses and the Remissions and Spontaneous Cures in 17 Cases of Goitre Occurring in Wards who Entered the Asylum after the last Quarter of 1905 and before the first Quarter of 1913 and are so in no way Influenced by any Typhoid Inoculations

The underlined quarters are those in which the ward was in residence at Sanawar and the quarter marked "G" is the quarter the ward was turned as goitrous.

Since about 1902, so a change of water supply could not have seen the cause. I can put forward no suggestion as to the cause, but I can point out that endemic goitre anyway at Sanawar, is a disease with marked tendency to remissions, relapses and spontaneous cures. This has been pointed out by McCarrison with figures that I was able to supply to him.

As a further example I may quote the cases of 87 wards these wards all entered after the last quarter of 1904 and left before the first quarter of 1913 and are therefore beyond any influence of any typhoid inoculation operations. Out of

1 R. McCarrison: Journal of Indian Research vol. 1 No 3, January 1906. 2 An Inquiry into the Causation of Goitre at the Lawrence Military Asylum Sanawar

these 84, in 44 the goitre disappeared spontaneously before they left the asylum, while in 17 cases relapses or remissions occurred as detailed in Table B. It is obvious in a disease with such a marked tendency to spontaneous fluctuation and recovery that a new treatment inaugurated without proper controls during a period of natural cessation of the disease will have success attributed to it which it does not deserve.

In conclusion, typhoid inoculation at Sanawar had no effect in any way on the course of the endemic goitre there, either individually or collectively.

A CONTRIBUTION TO THE ETIOLOGY OF EPIDEMIC CEREBRO-SPINAL MENINGITIS

By M F H GAMBLE L.R.C.P. (S. EDIN.), MEDICAL SUPERINTENDENT HOSPITAL FOR INSANE, KEW VICTORIA, AUSTRALIA

UNTIL a few months ago, in common with the great majority of my fellow practitioners in Victoria, I knew nothing more about this disease than what I learned from the text-books when a student, for prior to the present epidemic we had little or no chance of seeing cases as the malady was non-existent here in epidemic form. The few sporadic cases that are said to have been met with in years past may or may not have been accurately diagnosed. Doubtless true sporadic cases of cerebro spinal meningitis do occur in the slum and semi-slum portions of any large city, and here the two causative factors in my opinion, are precisely those that light up the epidemic form in military camps and barracks.

Turning to the vital statistics available, I find no reference whatever to the occurrence of cerebro-spinal meningitis in Victoria for the past 20 years¹ and in the comprehensive return contained in the Statistical Register for Victoria ending June, 1913² not a single death from cerebro-spinal meningitis was recorded, nor was any case of the disease treated in any general hospital during that year in Victoria. Those who say that there have been numbers of cases of the disease every year in all parts of Victoria are asserting that which is untrue and misleading. I am emphasising this matter as it has a material bearing on the views I desire to bring before the profession.

Epidemic cerebro-spinal meningitis was unknown in Victoria until May 27th, 1915, it was then that the outbreak originated in the military training camp at Seymour. Since that time I have given much thought to the problem of the etiology of the disease and have studied the literature on the subject. As a result I became convinced that the accepted ideas concerning the causation and dissemination of the disease were erroneous and needed to be revised, if the profession could hope to deal adequately and rationally with the epidemic—that is in going to the root of the trouble and grappling with the actual sources of the infection. In order to bring the matter under the notice of the authorities I wrote the following letter on August 17th to the Medical Journal of Australia, hoping that thereby discussion and interest would be stimulated.

SIR.—Recently I felt impelled to issue the following order to the staff of the large Government institution of which I have control. I made use of the two blunt Anglo-Saxon words purposely to arrest the attention of, and to impress, my lay readers.

Epidemic of Cerebro-spinal Meningitis.
As this fatal disease is almost certainly conveyed from one person to another by lice and by no other channel and as the disease is caused by the bite of a louse, I must order that the strictest precautions be taken by the whole staff to eradicate lice from the asylum. Systematic examination of the patients their clothes, bed linen and beds must be conducted until further notice, and report is to be made at once if any vermin be discovered. Neglect of this order may lead to many deaths amongst us.

- My reasons for giving such instructions were as follow —
1 That the present epidemic originated in Victoria at the Seymour Military Camp in winter time
2 That this camp was very inadequately supplied with water for bathing purposes, and the tents were overcrowded

1 Victorian Year Book 1913-14.
2 Parliamentary Papers

3 That the soldiers, on the whole, are reluctant to take a daily cold shower in the open in winter, thus providing the soil on which pediculi corporis thrive so vigorously

4 Hundreds of the soldiers in any large training camp in the vicinity of a populous town suffer from gonorrhoea

5 The fact that he has gonorrhoea is sedulously concealed by the soldier for many reasons, and being mistreated, if treated at all, the case drags on indefinitely

6 The unwashed soldiers catch pediculi from one another and the vermin breed apace in their congenial habitat. Other men, owing to the overcrowded tents, are infested, until the camp, generally, reeks with vermin. This, I regret to say, is no idle statement as regards the Seymour Camp at the time referred to

7 The soldier with a gonorrhoeal discharge becomes verminous, and the pediculi naturally harbour in the public region which is fouled with the discharge, and they ingest myriads of gonococci

8 The arachnoid mater is purely a serous membrane, and, like the synovial membranes generally, is very prone to be affected by the gonococcus

9 Bacteriologically, the coccus most commonly found in cases of cerebro spinal meningitis is indistinguishable from the gonococcus

10 The gonococcus laden pediculi are conveyed by direct personal contact to other persons, and by their bite they implant the cocci in the lymph stream, and the germs are thence carried to the "point of election" or most receptive tissue (for the gonococcus)—namely, the meninges of the brain and spinal cord—producing therein an intense inflammatory reaction, with exudation and signs of general infection. The synovial membranes of the joint are frequently affected also

11 The person infected with gonorrhoea in the ordinary way—that is, per urethram—it appears likely to me has a certain immunity from secondary cutaneous infection by his pediculi

12 It is a well authenticated fact, I need scarcely say, that typhus fever (another filth disease) is conveyed from one person to another by means of fleas or other vermin infected with the typhus germ. Malaria is also, of course, due to the bite of a germ laden mosquito, and plague to the bite of a flea from a bubonic rat

It is my firm conviction that cerebro-spinal meningitis in epidemic form is a true gonorrhoeal inflammation of the arachnoid membrane of the brain and spinal cord, set up by the bites of gonococcal infected pediculi corporis. To spray the nasal and buccal mucous membranes with eucalyptus or other antiseptic as a preventive, is a puerile waste of time and material. One can find almost as many different cocci in the nose and throat of an apparently healthy person as there are days in the year. From a consideration of the above facts the line of prophylactic treatment to be adopted to deal with this scourge is self evident. Unhappily, so far as our knowledge at present avails, this is a disease for which prevention is the only cure

No notice was taken of this communication, but, feeling sure that the theory I was propounding had at least some foundation in common sense, I was constrained to return to the charge in a second letter to the *Journal* written on Sept 7th, as follows—

SIR,—Since writing my previous letter I have had an opportunity of reading a discussion on this disease, cerebro-spinal meningitis, held at the Royal Society of Medicine, England, in February last, and I now submit extracts from that discussion and my comments thereon (Proceedings, vol viii, No 5). The theory that the meningococcus is the specific organism of the disease is exploded, for Dr Osler says the results of the use of Flexner's meningococcal serum in the present European epidemic was far from satisfactory. Secondly, a polyvalent serum, including the newest strain para meningococcus, is now recommended. The use of a polyvalent serum in so definite a disease is unscientific, a mere groping about in the dark. Polyvalent sera are not employed in typhoid, or diphtheria, no, because their specific organisms are known. The true causal organism of cerebro-spinal meningitis has yet to be discovered. The great variability of the strains of the germ at present held accountable for the disease is the bacteriologist's nightmare. The disease is never pandemic in the sense that influenza is. It has always been a soldiers' disease. Oversea troops on their return home are often responsible for epidemics, and the majority of outbreaks have started in barracks. It is the private soldier who invariably contracts the disease, not the officers, who live a more hygienic life. It usually attacks young recruits. Why? Because these youths especially if from the country, "go the pace" when on leave in the city, with the usual consequences. As to sources of infection, Dr Osler stresses the importance of carriers—i.e., healthy persons who have meningococci in

their naso-pharynx, whether or not they have been contacted. As no explanation is forthcoming why such carriers are found amongst those who have never been exposed to the disease, and as it is undecided how the germ really reaches the meninges, whether through the ethmoidal sphenoidal route or through the blood stream, I regard the naso-pharyngeal theory of infection as untenable. Further, does the ethmoidal sphenoidal route explain the dominance of the spinal involvement and symptoms? Why do so many of the so-called carriers fail to develop the disease? Are not the catarrhal symptoms associated with the disease due to the micrococcus catarrhalis rather than to the meningococcus? Almost every soldier trained at Seymour Camp had naso-pharyngeal catarrh for a time. Why, then, were there not more cases of cerebro-spinal meningitis?

The real "carriers," I believe, are pediculi corporis, laden with ingested gonococci or full of serum from a meningitic patient. Such ingested gonococci may undergo some mutation in the body of their host, the pediculus, thus causing the bacteriological confusion as to the various "strains" found in the disease. Would a bacteriologist kindly test this, as yet, uninvestigated opinion?

Preventive vaccination for this particular disease is not recommended either by the War Office or the Local Government Board in their respective recent memoranda. It is a definitely preventable disease. The present epidemic offers a golden opportunity for studying the etiology, and good would result if the branches of the Association in the several States devoted a portion of each monthly meeting to its discussion while the epidemic is with us, for in the coming summer when ablations will be the order of the day, the disease will temporarily become quiescent, and may be forgotten.

The scrappiness and inelegance of the above letter are due to its being a very condensed précis of the original, for which the editor could not afford space. I ventured to send a copy of the latter to the P.M.O. at Military Headquarters, Melbourne, in the hope that, if my views appealed to the military authorities, measures would be taken to deal efficiently, to my mind with the sources of infection at the various training camps throughout the Commonwealth. In acting as I did I had no wish to cast reflections on the adequacy of the medical arm of the Forces. I merely desired to point out that it was more than probable that the real cause of the epidemic was so patent and self evident that it was being overlooked, and that the disease was being fought with faulty strategy. However that may be it is abundantly clear that the weapons used and the plan of campaign adopted have had no appreciable effect in staying the onward march of the foe, for up to the end of August last there had been under treatment in the Alfred Hospital alone 137 military and 16 civilian cases, while up to Oct 9th the Health Board reported that 450 cases had occurred throughout the State.

To an unprejudiced mind this indicates unquestionably that the preventive measures adopted so far have sadly failed in their purpose. To make it understandable why I issued the order to my staff as shown in my first letter I should add that the patients in the institution are very frequently visited by trainees from the several camps, and I desired to prevent the importation of germ infested vermin into the asylum. So far I have succeeded, as no case of cerebro-spinal meningitis has developed amongst the 1200 inhabitants. Incidentally it should be mentioned that outbreaks of catarrhal infections, nasal and pharyngeal are of common occurrence in the institution, but why, I ask, has cerebro-spinal meningitis never yet broken out in so densely crowded a population if the naso-pharyngeal route of infection be the true one in this disease?

Our colleague Dr A. Jeff Wood, honorary physician to the Children's Hospital, does not support the naso-pharyngeal theory, but thinks the avenue of infection is through the intestinal mucosa. From the admissions made by several speakers at the two recent discussions on the disease at the Victorian Branch of the Association the naso-pharyngeal theory seems in parlous straits. It was stated that the reputed infective germ is so elusive, and the sources of error in tracing it so numerous, that to properly examine the naso-pharyngeal secretion of say, one contact or so-called carrier requires very elaborate and exceedingly recondite and careful bacteriological search covering four or five days of constant application by a highly skilled and experienced worker. An interval of an hour or two between the taking of the swab and its examination renders such examination useless was the dictum of one speaker competent to give an opinion and endorsed by another of high repute. Contrast

is with the case of diphtheria, the bacillus causing which can be identified with the utmost ease and certainty by the veriest novice in bacteriology even if the swab has travelled from one end of Victoria to the other. That we now with certainty the real causal organism of cerebro-spinal meningitis I very strongly doubt. The bacteriologist as almost run his quarry to earth, but not quite. And this want of success is, I think, mainly due to the fact that he is following the time-honoured though false scent.

No indubitably specific serum has yet been discovered which will prevent, cure, or even modify the disease, though many have been tried with very varying results. Naso-pharyngeal disinfection either as a preventive or curative measure has proved inefficacious.¹ The drug most favoured by one metropolitan hospital is shown by another hospital to be inoperative. Vaccination for this disease is discounted by the authorities best qualified to pronounce upon it. In our local epidemic those nurses who are unvaccinated seem as secure from infection as those who have submitted to vaccination, and no nurse of either class has been infected during the outbreak, and further it seemed immaterial whether they wore respirators or not. It appears to me that the catarrhal condition of the naso-pharynx seen in very many of the cases of cerebro-spinal meningitis is rather an indication that a general infection has occurred and does not mean that therein was to be found the portal of entry of the infective organism.

To indicate the prevalence of gonorrhoea in a training camp Dr Schlunk, in giving evidence before Mr Justice Rich's Commission of Inquiry into the Liverpool Camp, New South Wales said that on the day he referred to there were in the quarantine compound 250 men suffering from that disease, and it is reasonable to assume that if there were that number of cases known to the authorities an equal, or even greater, number of cases pervaded the camp undiscovered. A trainee in the venereal compound not only loses his leave, but also loses about 4s or 5s pay each day. There were about 4000 or 5000 trainees in the Liverpool Camp at the time referred to above.

Reduced to its essentials the prevailing epidemic in this State goes to prove 1. That there is an intimate etiological relationship between the gonococcus, pediculi corporis and epidemic cerebro-spinal meningitis. 2. Until this year the disease was quite unknown in Victoria. 3. The epidemic originated in a military training camp at Seymour in winter. 4. The source of the outbreak must then necessarily be looked for amongst the soldiery. 5. The organism causing the disease is practically identical with the gonococcus a mutant form perhaps. 6. Hundreds of the young trainees suffered from gonorrhoea in active form and naturally cloaked the fact so far as possible from the medical officers. 7. There was an absence of strict medical supervision of these cases they were not detected, and even when discovered they were not adequately segregated before the epidemic began. I say this in no captious spirit, for the medical staff was not then numerically strong enough. 8. The personal habits of hundreds of the rank and file were faulty in the extreme, hence the camp became very verminous. 9. The hygiene of the camp was bad from many points of view. 10. Over 60 per cent of the female cases treated in the Melbourne Hospital gave a history of direct contact with soldiers, the women being for the most part of the factory girl and waitress class. I venture to think that the common lodging houses and the public latrines provided their quota of cases amongst male civilians. 11. The above facts point convincingly I think, to the actual sources of the epidemic, and as clearly indicate the methods to be adopted to stamp out the scourge in a rational manner and prevent its dissemination among the civilian population. 12. To make the trainees wash themselves thoroughly and regularly in camp, to discover and rigidly quarantine all those suffering from gonorrhoea (this being the more important) will effectually eradicate, and as surely prevent a recurrence of epidemic cerebro-spinal meningitis.

As an addendum, I may mention that the epidemic under notice had a death rate of 52 per cent, the total number of deaths from the disease being 333. The outbreak came to an end in December.

New Victoria, Australia.

Clinical Notes: MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL

A CASE OF FRACTURE OF THE TUBERCLE OF THE TIBIA

By F. M. NEILL, M.B., B.S. LOND.

THE following case may be of interest on account of the rarity of the accident.

Captain — aged 45 eight months previous to the present accident came to me with synovitis of the right knee, sustained while alighting from a moving tram. Two years before something "went out" on the outer side of his knee-joint in consequence of which he was laid up for two or three weeks with water on the knee. Since then his knee had been weak and he had had frequent mild attacks of synovitis. On this occasion treatment by massage and graduated contractions prevented any further trouble until the present accident. On August 31st, 1914, I was driving behind a slowly moving tram when I saw the patient running from the pavement to the tram. He seized an upright and attempted to board, but missed his footing, his right foot coming heavily in contact with the ground his knee being in a semi flexed position. He was obviously hurt as he clung on with his hand and did not attempt to get on the tram again. The latter was quickly stopped. He told me that his knee had gone again and that it felt as if his knee-cap had suddenly gone up his thigh but that it did not hurt like his previous accidents. An enormous swelling could be both seen and felt through his trousers in the front of the upper part of the leg. On more thorough examination it was found that the patella was intact that there was no fluid in the joint, but that there was a very large hæmatoma below the joint in front of the upper end of the tibia. Owing to the swelling it was difficult to determine whether the patella was displaced or not. A posterior splint and an ice-bag were applied, and he was removed to the nursing home. He had very little pain, and next day there was still no fluid in the joint, nor was there at any subsequent period. The hæmatoma was tapped and a good deal of blood withdrawn. An X-ray photograph showed the patella displaced upwards and the upper part of the tibial tubercle torn off. The part torn off was apparently small and probably consisted of two or three fragments.

I operated on Sept 8th. A horseshoe-shaped incision was made with the convexity downwards and the skin flap dissected up. The fragments of bone three in number, were attached to the lower end of the ligamentum patellæ and were widely separated from their true position. The fragments, along with the ligamentum, could be easily drawn down into position. The bony fragments were however, much too small to be fixed in position either by a screw or by a silver wire. A hole was therefore drilled in the projecting lower portion of the tubercle and a stout piece of silk passed through. One end of the silk was passed from behind forwards through the ligamentum patellæ just above the broken fragments of bone. When the two ends were tied the fragments were in excellent position. A few more stitches were put in between the ligament and the periosteum of the tibia. The aponeurosis on each side of the ligamentum patellæ was badly torn. On the inner side it was possible to bring the torn edges together with silk sutures, on the outer side it was impossible as it was torn to shreds. The skin incision was closed with silkworm gut and the limb encased in plaster of Paris. On Sept 16th the plaster casing was removed and the stitches were taken out. Healing was by first intention. The plaster was unsatisfactory, so a McIntyre splint was substituted. From this day onwards daily massage and passive movements were adopted, and also the muscles of the thigh and leg were kept in good condition by electrical graduated contractions. On Oct. 14th the splint was removed during the day and active movements in bed were allowed. On the 20th the use of the splint was discontinued and a few days later he was able to bend his knee to a right angle. On the 27th he left his bed and walked about with the aid of crutches while on the 30th he could, while sitting on the edge of the bed raise his foot from a dependent position. On Nov 4th he could get about easily with the aid of only one stick. Flexion and extension of the joint were perfect, but there was too much lateral movement. Owing to the side were in better condition than those on the sound limb. The patient returned to sea early in December about three

months after the operation. His only complaint now is that the joint feels a little weak at the sides. He does not find it necessary to wear a bandage or knee-cap.

There is very little in text-books of surgery on the subject of separation or fracture of the tubercle of the tibia. The universal recommendation is to wire, screw, or peg the fragment into place. In this case it was impossible to carry out any of these directions, but it was a very simple matter to get the fragments into perfect position in the manner described.

Shanghai

PLACENTA PRÆVIA CENTRALIS

By WILLIAM ROBERTSON, M.D. GLASGOW

I HAD slight notice of the probable condition of the following case from the husband, who told me that his wife (European) had had hæmorrhage three or four times during her present pregnancy.

The patient, aged 36, who was in her sixth pregnancy, "felt life," and had no untoward experience beyond the slight hæmorrhages referred to. These were controlled by bromide and ergot, and rest in bed. I had no opportunity of vaginal examination until finally being called in for accoucheurment. The pregnancy had reached full term, and foetal life was distinct. Vaginal examination showed a centrally placed placenta prævia. The os was of the size of a crown piece, thin, soft, and dilatable. Examination brought away a little blood. Prudence seemed to indicate plugging. The mother was anæmic, with not too good a pulse. Previous labours were normal and not prolonged. Plugging was performed manually without distress or much shock. After a good rest and nourishment the plugs were removed and found only stained. The os was still further dilated. Under chloroform internal version was performed. The placenta was found to be very thin, so that the waters and the head, not yet engaged, could be readily felt. A foot was brought down and the child, a large one, was safely turned. Before the head was engaged the placenta came away entire. An effort was made to deliver the child as rapidly as possible, but the head stuck and delayed delivery for half an hour. The child's head was 14 inches in circumference and the mother was of small build. The child was born dead, as was to be expected. The mother now required all attention. She had become pale, faint, and pulseless, but answered to the usual restoratives. Very little blood was lost during manipulations and none afterwards. A few tabloids of salt and citrate were placed on the placental area. Recovery was rapid and uneventful.

One might have thought of perforating the placenta allowing the waters to escape, and letting the case proceed in the usual way. The child's head would, however, at once have put the whole placenta out of functioning, and besides the length and shock of labour would have invalidated the life of the mother, and certainly the life of the child. Version therefore seemed to offer a chance for both. The slight hold the placenta had on the cervix was disconcerting. I made no effort to detach it beyond perforating it for version, which was an easy matter. The arm in the os prevented a too rapid loss of the waters and facilitated seizure of a foot. The placenta came away, of course, completely shorn of membranes. These had to be subsequently very carefully removed.

St. Mark's Cape Province South Africa

CONVALESCENT HOME AT GRANGE OVER SANDS—On August 7th Mr Charles Duncan, M.P., opened the new convalescent home of the Workmen's Clubs Union which has been erected at a cost of £20,000 at Grange-over-Sands. The building will accommodate 66 residents.

EDINBURGH ROYAL INFIRMARY THE APPOINTMENT OF SENIOR STUDENTS TO RESIDENT POSTS—At a meeting of the managers of the Edinburgh Royal Infirmary held on August 7th the following appointments were made—Resident physicians James M. Tyrrell, final year student, to Sir Robert Philip, and Harold Badler, final year student, to Professor W. Russell. Resident surgeons Gerald W. Grant, final year student, to Professor F. M. Caird, J. McAuslin, final year student, to Mr N. T. Brewis, Adam Prentice to Mr D. Wallace, Duncan Cook, final year student, to Mr F. E. Jardine. Surgical out-patient department John Allison and J. Laurie Lamont, both final year students, to Mr Jardine.

Pathological Lying, Accusation, and Swindling. A Study in Forensic Psychology

By WILLIAM HEALEY, A.B., M.D., Director, Psychopathic Institute, Juvenile Court, Chicago, Associate Professor, Nervous and Mental Diseases, Chicago Polytechnic, and MARY TENNEY HEALEY, B.L. London: William Heinemann 1916. Pp. 287. Price 10s. 6d. net.

THE main purpose of this work is to establish a "clear definition of pathological lying than has hitherto been offered." The authors evidently assume that the existence of such an entity is generally accepted, but contend that previous writers have employed an insufficiently clear terminology, and have erroneously included under this heading cases of epilepsy, insanity, and mental defect. They regard "pathological lying" as a "type of delinquency," and at the outset of their book essay to define it as "falsification, entirely disproportionate to any discernible end in view engaged in by a person who, at the time of observation cannot definitely be declared insane, feeble minded or epileptic. Such lying manifests itself, most frequently by far, over a period of years or even a life time." In the course of the introductory chapter it is stated that lawyers or other professional specialists have slight knowledge of this subject, and that one reason for this slight knowledge is the fact that almost nothing has been written on it in English. The second chapter gives some account of much German and a little French literature on the subject, and we learn from this that the generally accepted term in Germany for "pathological lying" is *pseudologia phantastica*—a term that at least in this context is not inoffensive.

After a careful perusal of the book before us which unquestionably contains many faithful and really interesting reports of such cases as are well known to medical psychologists conversant with children or "delinquents" or with both of these groups, we are unable to attribute any scientific or practical value to the conception of *pseudologia phantastica* in its relation either to psychology, criminology, or penology. It appears to us that the very definition laid down by the authors, and the terms used by them in other parts of the book, imply that they regard insanity and mental defect as concerned with the intellect alone. The cases of "pathological lying" which they appear to regard rightly as essentially consisting in disorder of conduct, are explicitly excluded from the class of "insane" persons because of the absence of delusions, and from the class of "mental defectives," or feeble minded, because, according to the value given to these terms by the authors, the word *mind* excludes all mental factors other than that of the intellect. If then, the disorder of conduct which is inseparable from the conception of "pathological lying," as presented to us in this book, is to be regarded as a type of "delinquency" unconnected with any disorder of intellect, or indeed with discoverable disorder of any kind, whether "mental" or "physical" it follows that the creation of a closely defined class of delinquents under the title of pathological liars is by no means helpful but, on the contrary, both confusing and meaningless. It seems to us that most of the cases so vividly described in this book are easily referable to mental disorder, from "insanity" to "mental defect" in its various expressions, and especially to the certainly ill named but justly recognised category of "moral imbeciles," or persons who inherently lack the capacity of being duly educated for social life in spite of fair general intelligence.

Undue multiplication of ill defined classes under new names is greatly to be deprecated, especially in connexion with matters that have a practical bearing. The study of disorders of conduct supplies the basic test of mental disorder of all kinds, whether such disorder be "true" "insanity" or "mental defect," it underlies moreover the problems of grading criminal responsibility and of the appropriate treatment of criminals. The authors of this book indeed appear to appreciate in some degree the difficulty of making a "close" definition of pathological lying by inserting a chapter on "borderland cases," but they have distinctly failed to establish the contention that the specially defined pathological liars are "mentally normal."

History of the Royal College of Surgeons in Ireland and of the Irish Schools of Medicine, including a Medical Bibliography and a Medical Biography

By Sir CHARLES A. CAMERON, C.B. Second edition, revised and enlarged. London: Simpkin, Marshall, and Co., Dublin: Fannin and Co., Edinburgh: J. Thine. 1916. Pp. 882.

THE history of the corporations of their own profession is, or should be, always of interest to medical men and Sir Charles Cameron's "History of the Royal College of Surgeons in Ireland" is a case in point, and a book made all the more attractive by its very discursiveness, for the inclusion of medical bibliography and biography affords its author great scope for giving his readers many lifelike pictures of past times. To deal first with the history of the College. The Irish surgeons were primarily, like their brethren in other lands, incorporated with the barbers, and a Guild of Barbers was established by Henry VI in Dublin in the year 1446 on St. Luke's day, the Guild being established for the promotion and exercise of the art of chirurgery. By Elizabeth's time there were surgeons in Dublin who were not incorporated with the barbers, but formed a society by themselves. This society was ordered, 1577, by a charter of the Queen to be incorporated with that of the barbers. It is worthy of note that Henry's charter provided for the admission of women. Another charter was granted by James II in 1687. In 1780 the Dublin Society of Surgeons resolved to apply for a charter incorporating the surgeons of Dublin into a Royal College. Naturally the barber surgeons objected, but the charter was granted all the same in 1784, and the first President of the Royal College was Samuel Croker King, who was also notable for having saved the life of a child who afterwards became the great Duke of Wellington. A second charter was granted in 1829, the most important feature of which was the giving powers to the College to admit to examination candidates who were not indentured apprentices. Supplemental charters were granted in 1844 and 1885.

For the general medical reader the most interesting portions of Sir Charles Cameron's work will probably be the biographical and bibliographical sections. In 1775 John Gilborne, M.D., wrote the "Medical Review a Poem, being a Panegyric on the Faculty of Dublin, Physicians, Surgeons, and Apothecaries marching in procession to the Temple of Fame." From this poem Sir Charles Cameron quotes extensively. Though we cannot say that the divine fire is present, yet the bard certainly succeeds in drawing a striking portrait—

The tractor'd Skull to Samuel Croker King
The broken Limb Wounds and Luxations bring
There's no Disaster but he can set right,
With Splints, Trepan and Bandage not too tight."

There is one blemish to which we must refer in an other wise admirable book and that is the extraordinary number of misprints especially in Latin passages. Nearly every Latin title of a book quoted has at least one misprint, and some have three or four, while even such a well worn tag as "Non omnis moriar" appears as "Non omnis morior." In other places we find "carundem" for "earundem," "com plarium" for "complurium," "templina" for "templum," and "paralus" instead of, we imagine, "paratus." Such errors should not appear in any book, least of all one dealing with a learned body and in a revised edition.

CURRENT GERMAN MEDICINE

Wounds of the Larynx—We are indebted to Dr Dundas Grant for a translation of Professor Körner's (Rostock) article dealing with three cases of gunshot injury of the larynx (*Zeitschr. f. Ohrenheilk.*, March, 1915).

CASE 1 Shot through larynx and pharynx below vocal cords from right and in front to the left backwards—There was no pain but loss of voice at the time (August 28th). There was some throwing up of blood without cough and for six days pain on swallowing. The left vocal cord and arytenoid cartilage were almost in the middle line, both on respiration and phonation. Below the commissure especially to the right there was a greyish red somewhat hummocky swelling. The shot must have been directly under the left arytenoid cartilage. The condition gradually settled down, and on Oct. 16th the movements of the arytenoid cartilage and vocal cords were quite normal; the irregular swelling under the commissure had become converted into a cicatrix in the form of a horizontal sharp-edged fold like structure which projected for about 2 mm. into the lumen of the larynx.

Professor Körner's comment is as follows. This was a shot through the larynx and hypo-pharynx. A small

infantry bullet had passed from in front through the thyroid cartilage somewhat on the right of the middle line, immediately under the commissure of the vocal cords. It left the larynx below the left crico-arytenoid joint, it must have perforated the wall of the hypo-pharynx on the left side in front and behind in order then to leave the body below the nape of the neck. We cannot tell whether the ball took in with it portions of the collar of the uniform. The results were simply a temporary fixation of the left arytenoid cartilage and a small scar under the commissure. Nothing which the experience of previous wars would have led us to expect as the inevitable result of such an injury was present, there was no great hæmorrhage, no extensive destruction of cartilage, and no dangerous œdema. The prophylactic tracheotomy, which was formerly so strongly recommended, was not carried out, and the result showed that in this case it would have been quite superfluous.

CASE 2 Shot on the right side through the lower jaw recovery with ankylosis of the right crico-arytenoid joint—The soldier was shot on Sept. 16th, 500 metres distance through the right horizontal portion of the lower jaw and the right side of the neck as he had bent forwards in order to lie down. At the moment of injury he observed a stinging and humming noise in the head, he fell forwards and for a short time was quite deafened. A soldier fastened the first dressing on the orifice of entrance, but no orifice of exit could be seen. Later when he got to the dressing station, the exit was found and bandaged. Immediately after the shot the voice was weak and hoarse but there was no dyspnoea nor expectoration of blood. On the other hand there was a slight pain on the right side of the neck during swallowing and the mouth could not be properly opened, while chewing was impossible and there was a feeling of numbness of the right side of the lower jaw. He was kept for a week and a half in a hospital and then treated in a garrison hospital at Rostock. On Oct. 12th—that is 26 days after the wound—Professor Körner saw him for the first time and found him in good condition, except for the pain on opening the mouth and chewing and the hoarseness. The orifice of entrance was 12 mm. laterally distant from the right corner of the mouth and about 3 mm. below the level of the junction of the lips. The orifice of exit, which was not yet completely healed, was 3 cm. to the right of the spinous process of the seventh cervical vertebra. It was about 3 cm. across. About the middle of the horizontal part of the lower jaw on the right there was a thickening of the bone perceptible to sight and touch and somewhat tender although the mouth could not be widely opened. It was still possible to inspect the buccal cavity and meso-pharynx, as well as to carry out indirect laryngoscopy. Internally there was no abnormality in the lower jaw. All the teeth were present and were sound. The structures of the palate were normal and the tongue movable in all directions. The right vocal cord was immovable in the middle line during both respiration and phonation; its edge was quite straight, the right arytenoid cartilage showed no movements and did not hang forwards otherwise the picture of the larynx was completely normal. There was no swelling or extravasation of blood. On the left side the movements of the arytenoid cartilage and vocal cord were unimpaired. The voice sounded somewhat thick, and on inquiry the wounded man stated that he noticed a slight difficulty in breathing on exertion. To the touch externally the larynx showed no difference between the right and the left sides but there was some tenderness on pressure on the posterior part of the right half of the thyroid cartilage. The muscles supplied by the right spinal accessory nerve were unaffected. An X-ray examination of the lower jaw revealed a grooved fracture running obliquely backwards and inwards, but without affecting the roots of the teeth. On Oct. 30th the laryngoscopic appearance was unchanged, the voice was quite clear, the mouth could be opened while the swelling of the jaw was scarcely to be detected and the orifice of exit had healed.

The author comments. This was a subcutaneous glancing shot on the right side of the larynx, it injured the posterior part of the right half of the thyroid cartilage, with this there was a lasting fixation of the right crico-arytenoid joint, as the result of which the vocal cords stayed in the middle line. The shot does not seem to have gone to the hypo-pharynx, as no trace of blood was expelled. The fact that the median position of the vocal cord did not depend upon an injury of the vagus nerve was shown by the fact that the arytenoid cartilage was not inclined forwards, and 44 days after the injury there was no concavity of the border of the vocal cords. An isolated injury of the trunk of the vagus so high up without injury of the great vessels or the other neighbouring cranial nerves is almost out of the question, and the deep, descending, recurrent branch cannot have been struck in this case, as at the level of the wound it must already have broken up into its muscular branches. Again, the posterior crico-arytenoid muscles cannot have been struck, as the hypo-pharynx was undamaged.

CASE 3 Shot in the right side of the face and neck with injury to the vagus the accessory and hypoglossal nerves—On August 23rd a shot from a distance of 250 metres struck the soldier on the right side of the face and neck. He did not lose consciousness at once but observed double vision and interference with his speech which became indistinct, hoarse, and weak so that it was difficult for him to make himself understood. Further he was unable to open his mouth wide or to lift nose or ear and no difficulty in breathing. A few days later the bullet was felt further back in the neck and extracted by an incision. Fifty days after the injury he was seen by Professor Körner for the first time. Apart from the above mentioned disturbances which were still present he appeared both mentally and bodily sound. There was found slight paralysis of the sixth nerve and on both sides neuritis of the teeth separating little more than 2 cm. the tongue when protruded pointed to the right. The soft palate during retching and phonation was drawn strongly to the left but the posterior wall of the

months after the operation His only complaint now is that the joint feels a little weak at the sides He does not find it necessary to wear a bandage or knee-cap

There is very little in text-books of surgery on the subject of separation or fracture of the tubercle of the tibia The universal recommendation is to wire, screw, or peg the fragment into place In this case it was impossible to carry out any of these directions, but it was a very simple matter to get the fragments into perfect position in the manner described

Pathological Lying, Accusation, and Swindling A Study in Forensic Psychology

By WILLIAM HEALEY, A.B., M.D., Director, Psychopathic Institute, Juvenile Court, Chicago, Associate Professor, Nervous and Mental Diseases, Chicago Polytechnic, and MARY TENNEY HEALEY, B.L. London William Heinemann 1916 Pp 287 Price 10s 6d net

THE main purpose of this work is to establish a "close definition of pathological lying than has hitherto been offered" The authors evidently assume that the existence of such an entity is generally accepted, but contend that previous writers have employed an insufficiently clear terminology, and have erroneously included under this heading cases of epilepsy, insanity, and mental defect They regard "pathological lying" as a "type of delinquency," and at the outset of their book essay to define it as "falsification, entirely disproportionate to any discernible end in view engaged in by a person who, at the time of observation cannot definitely be declared insane, feeble minded, or epileptic Such lying manifests itself, most frequently by far, over a period of years or even a life time." In the course of the introductory chapter it is stated that lawyers or other professional specialists have slight knowledge of this subject, and that one reason for this slight knowledge is the fact that almost nothing has been written on it in English. The second chapter gives some account of much German, and a little French, literature on the subject, and we learn from this that the generally accepted term in Germany for "pathological lying" is *pseudologia phantastica*—a term that at least in this context is not luciferous

After a careful perusal of the book before us, which unquestionably contains many faithful and really interesting reports of such cases as are well known to medical psychologists conversant with children or "delinquents," or with both of these groups, we are unable to attribute any scientific or practical value to the conception of *pseudologia phantastica* in its relation either to psychology, criminology, or penology It appears to us that the very definition laid down by the authors, and the terms used by them in other parts of the book, imply that they regard insanity and mental defect as concerned with the intellect alone. The cases of "pathological lying" which they appear to regard rightly as essentially consisting in disorder of conduct are explicitly excluded from the class of "insane" persons because of the absence of delusions, and from the class of "mental defectives," or feeble minded, because, according to the value given to these terms by the authors, the word *mild* excludes all mental factors other than that of the intellect If then, the disorder of conduct which is inseparable from the conception of "pathological lying," as presented to us in this book, is to be regarded as a type of "delinquency" unconnected with any disorder of intellect, or indeed with discoverable disorder of any kind, whether "mental" or "physical" it follows that the creation of a closely defined class of delinquents under the title of pathological liars is by no means helpful but on the contrary, both confusing and meaningless It seems to us that most of the cases so vividly described in this book are easily referable to mental disorder, from "insanity" to "mental defect" in its various expressions, and especially to the certainly ill named but justly recognised category of "moral imbeciles," or persons who inherently lack the capacity of being duly educated for social life in spite of fair general intelligence

Undue multiplication of ill defined classes under new names is greatly to be deprecated especially in connexion with matters that have a practical bearing The study of disorders of conduct supplies the basic test of mental disorder of all kinds, whether such disorder be styled "insanity" or "mental defect," it underlies moreover the problems of grading criminal responsibility and of the appropriate treatment of criminals The authors of this book indeed appear to appreciate in some degree the difficulty of making a "close definition of pathological lying" by inserting a chapter on "borderland" cases, but they have distinctly failed to establish the contention that the specially defined pathological liars are "mentally normal"

History of the Royal College of Surgeons in Ireland and of the Irish Schools of Medicine, including a Medical Bibliography and a Medical Biography

By Sir CHARLES A. CAMERON, C.B. Second edition, revised and enlarged. London: Simpkin, Marshall, and Co., Dublin: Fennell and Co., Edinburgh: J. Thin. 1916. Pp. 882.

THE history of the corporations of their own profession is, or should be, always of interest to medical men. And Sir Charles Cameron's 'History of the Royal College of Surgeons in Ireland' is a case in point and a book made all the more attractive by its very discursiveness, for the inclusion of medical bibliography and biography affords its author great scope for giving his readers many lifelike pictures of past times. To deal first with the history of the College. The Irish surgeons were primarily like their brethren in other lands, incorporated with the barbers and a Guild of Barbers was established by Henry VI in Dublin in the year 1446 on St. Luke's day, the Guild being established for the promotion and exercise of the art of chirurgery. By Elizabeth's time there were surgeons in Dublin who were not incorporated with the barbers, but formed a society by themselves. This society was ordered, 1577, by a charter of the Queen to be incorporated with that of the barbers. It is worthy of note that Henry's charter provided for the admission of women. Another charter was granted by James II in 1687. In 1780 the Dublin Society of Surgeons resolved to apply for a charter incorporating the surgeons of Dublin into a Royal College. Naturally the barber surgeons objected but the charter was granted all the same in 1784, and the first President of the Royal College was Samuel Croker King, who was also notable for having saved the life of a child who afterwards became the great Duke of Wellington. A second charter was granted in 1829, the most important feature of which was the giving powers to the College to admit to examination candidates who were not indentured apprentices. Supplemental charters were granted in 1844 and 1885.

For the general medical reader the most interesting portions of Sir Charles Cameron's work will probably be the biographical and bibliographical sections. In 1775 John Gilborne, M.D. wrote the 'Medical Review a Poem', being a Panegyric on the Faculty of Dublin, Physicians, Surgeons, and Apothecaries marching in procession to the Temple of Fame. From this poem Sir Charles Cameron quotes extensively. Though we cannot say that the divine fire is present yet the bard certainly succeeds in drawing a striking portrait—

The fractur'd Skull to Samuel Croker King
The broken Limb, Wounds, and Luxations bring

Such errors should not appear in any book least of all one dealing with a learned body and in a revised edition.

CURRENT GERMAN MEDICINE

Wounds of the Larynx—We are indebted to Dr. Dundas Grant for a translation of Professor Körner's (Rostock) article dealing with three cases of gunshot injury of the larynx (*Zeitschr. f. Ohrenheilk.* March 1915).

CASE 1. Shot through larynx and pharynx below vocal cords from right and in front to the left backwards—There was no pain, but loss of voice at the time (August 23th). There was some throwing up of blood and arytenoid cartilage were almost in the middle line both on respiration and phonation. Below the commissure especially to the right, there was a greyish red, somewhat hummocky swelling. The shot must have been directed under the left arytenoid cartilage. The condition gradually settled down and on Oct. 16th the movements of the arytenoid cartilage and vocal cords were quite normal. The irregular swelling of a horizontal sharp-edged fold like structure which projected for about 2 mm. into the lumen of the larynx.

Professor Körner's comment is as follows. This was a shot through the larynx and hypo-pharynx. A small

infantry bullet had passed from in front through the thyroid cartilage somewhat on the right of the middle line, immediately under the commissure of the vocal cords. It left the larynx below the left crico-arytenoid joint, it must have perforated the wall of the hypo-pharynx on the left side in front and behind in order then to leave the body below the nape of the neck. We cannot tell whether the ball took in with it portions of the collar of the uniform. The results were simply a temporary fixation of the left arytenoid cartilage and a small scar under the commissure. Nothing which the experience of previous wars would have led us to expect as the inevitable result of such an injury was present, there was no great hemorrhage, no extensive destruction of cartilage, and no dangerous oedema. The prophylactic tracheotomy, which was formerly so strongly recommended was not carried out, and the result showed that in this case it would have been quite superfluous.

CASE 2. Shot on the right side through the lower jaw recovery with ankylosis of the right crico-arytenoid joint—The soldier was shot on Sept. 16th 600 metres distance through the right horizontal portion of the lower jaw and the right side of the neck, as he had bent forwards in order to lie down. At the moment of injury he observed a singing and humming noise in the head, he fell forwards and for a short time was quite deafened. A soldier fastened the first dressing on the orifice of entrance, but no orifice of exit could be seen. Later when he got to the dressing station, the exit was found and bandaged. Immediately after the shot the voice was weak and hoarse but there was no dyspnoea nor expectoration of blood. On the other hand, there was a slight pain on the right side of the neck during swallowing and the mouth could not be properly opened while chewing was impossible, and there was a feeling of numbness of the right side of the lower jaw. He was kept for a week and a half in a hospital and then treated in a garrison hospital at Rostock. On Oct. 12th—that is 26 days after the wound—Professor Körner saw him for the first time and found him in good condition except for the pain on opening the mouth and chewing and the hoarseness. The orifice of entrance was 12 mm. laterally distant from the right corner of the mouth and about 3 mm. below the level of the junction of the lips. The orifice of exit, which was not yet completely healed was 3 cm. to the right of the spinous process of the seventh cervical vertebra. It was about 3 cm. across. About the middle of the horizontal part of the lower jaw on the right there was a thickening of the bone perceptible to sight and touch and somewhat tender although the mouth could not be widely opened. It was still possible to inspect the buccal cavity and meso-pharynx, as well as to carry out indirect laryngoscopy. Internally there was no abnormality in the lower jaw. All the teeth were present and were sound. The structures of the palate were normal and the tongue movable in all directions. The right vocal cord was immovable in the middle line during both respiration and phonation. Its edge was quite straight, the right arytenoid cartilage showed no movements and did not hang forwards otherwise the picture of the larynx was completely normal. There was no swelling or extravasation of blood. On the left side the movements of the arytenoid cartilage and vocal cord were unimpaired. The voice sounded somewhat thick, and on inquiry the wounded man stated that he noticed a slight difficulty in breathing on exertion. To the touch externally the larynx showed no difference between the right and the left sides but there was some tenderness on pressure on the posterior part of the right half of the thyroid cartilage. The muscles supplied by the right spinal accessory nerve were unaffected. An X-ray examination of the lower jaw revealed a grooved fracture running obliquely backwards and inwards, but without affecting the roots of the teeth. On Oct. 30th the laryngoscopic appearance was unchanged the voice was quite clear the mouth could be opened, while the swelling of the jaw was scarcely to be detected and the orifice of exit had healed.

The author comments. This was a subcutaneous glancing shot on the right side of the larynx, it injured the posterior part of the right half of the thyroid cartilage, with this there was a lasting fixation of the right crico-arytenoid joint, as the result of which the vocal cords stayed in the middle line. The shot does not seem to have gone to the middle pharynx, as no trace of blood was expelled. The fact that the median position of the vocal cord did not depend upon an injury of the vagus nerve was shown by the fact that the arytenoid cartilage was not inclined forwards, and 44 days after the injury there was no concavity of the border of the vocal cords. An isolated injury of the trunk of the vagus so high up without injury of the great vessels or the other neighbouring cranial nerves is almost out of the question, and the deep, descending recurrent branch cannot have been struck in this case as at the level of the wound it must already have broken up into its muscular branches. Again, the posterior crico-arytenoid muscles cannot have been struck, as the hypo-pharynx was undamaged.

CASE 3. Shot in the right side of the face and neck, with injury to the vagus accessory and hypoglossal nerves—On August 23rd a shot from a distance of 250 metres struck the soldier on the right side of the face and neck. He did not lose consciousness at once, but observed double vision and interference with his speech, which became indistinct, hoarse, and weak so that it was difficult for him to make himself understood. Further he was unable to open his mouth wide or to lift his right arm completely. There was no bleeding from the mouth or ear and no difficulty in breathing. A few days later the bullet was felt further back in the neck and extracted by an incision. Fifty present he appeared both mentally and bodily sound. There was still found slight paralysis of the sixth nerve and on both sides neuritis of the teeth separating little more than 2 cm. the tongue when phonation was drawn strongly to the left, but the posterior wall of the

pharynx contracted equally on both sides. In the Killian position and after depression of the tongue downwards and forwards with Czermak's urula holder (*sic*) laryngoscopy could be effected, the epiglottis pointed from below upwards and to the left, the right vocal cord was immobile in the position of abduction, the left one overstepped the middle line by a few millimetres during voice production, but not sufficiently to touch the right one. The right arytenoid cartilage fell forward to some extent, the voice was toneless and accompanied by an escape of air but articulation was very little impeded by the paralysis of the right hypoglossal nerve. Comparative tests for parotid secretion and taste on both sides were undecided owing to the closure of the mouth. In the same way it was impossible to test the sensibility of the larynx. The right sterno-mastoid and trapezius were paralysed and atrophic and gave the reaction of degeneration. The right shoulder hung down in the manner characteristic of paralysis of the accessory nerve and the arm could not be raised above the horizontal. The pulse during absolute rest was 96 in the minute. By the middle of November the condition had not altered, except that the mouth could be opened more widely.

Professor Körner adds. In this case it was not the larynx itself but the vagus nerve supplying it which was struck, the bullet penetrated the right zygoma, broke through the ascending process of the right inferior maxilla, and lodged in the right side of the neck under the skin where the spinal accessory nerve comes forward beneath the middle of the posterior margin of the sterno-mastoid muscle. The zygoma seems only to have been damaged externally, and no traumatic inflammation of the antrum supervened. Paralysis of the sixth nerve, indicated by double vision immediately on receipt of the wound, is out of the question. One might suppose that it was an injury of the abducens nerve, but the splintering of the bone which reaches from the zygoma into the orbits should directly involve the external rectus muscle. In regard to this the X rays gave us no enlightenment. To this we add bilateral optic neuritis, which at first sight may be explained by bleeding in the skull, to which we might at the same time attribute the sixth nerve paralysis. The closure of the mouth may be explained by the fracture of the coroid process of the lower jaw. The vagus nerve must have been struck high up soon after its exit from the skull, but whether it was above the giving off of the superior laryngeal branch cannot be decided, as the sensibility of the larynx could not be tested. This injury led to the complete paralysis of the right vocal cord and half of the palate and to the quickening of the pulse. Whether the accessory nerve, injury of which gave rise to the paralysis of the sterno-mastoid and trapezius, was struck near its exit from the skull or only behind the sterno-mastoid in the neck where the bullet was later extracted must remain undecided. Possibly the glossopharyngeal nerve was also damaged, but with regard to this nothing more could be ascertained on account of the closure of the mouth preventing the necessary investigation. Finally, the hypoglossal nerve was affected. The unilateral paralysis of the tongue had the result that at first the patient's speech was scarcely intelligible. This difficulty gradually passed away with exercise, although the hemiplegia of the tongue and also of the larynx and palate continued, and are probably irreparable. Suture of the accessory nerve might perhaps overcome the paralysis of the shoulder if carried out soon and one succeeded in finding the divided nerve ends, however we do not know where they should be looked for, high up near the trunk or more peripherally behind the sterno-mastoid.

The lesson drawn by the author from the three cases is that the wounded men, although at the beginning they showed definite signs of injury of the larynx, were not investigated in the larynx either in the field hospital or later in the hospitals far behind the scene of action, that it was only when they reached the university town where for some years the official surgeons in the hospital for the reserves had been accustomed to carry out the necessary special examination of their patients that laryngoscopic examination was made, in one case 13, in another 26, and in the third 55 days after the injury, and that numerous important and interesting wounds of the larynx will escape observation and treatment, as military surgical statistics show, if laryngologists do not systematically search them out in the hospitals.

Another case, for which we are also indebted to Dr Dundas Grant is taken from an article by Professor Denker (Halle) official oto-laryngological surgeon to the Fourth Army Corps on Gunshot Injuries of the Upper Air Passages (*Arch f Ohr-, Nas- u. Kehlkopfheilk*, February 1915). The case is of interest in itself and because it concerns an English officer.

The patient was an English officer wounded in the head by a rifle bullet at Etrepas on August 27th. He was taken into a reserve hospital at that place, and there tracheotomy was carried out. Then he was handed over to the reserve hospital in T in the following condition. The patient was absolutely voiceless, wearing a tracheal cannula which very soon got blocked up with blood and serum. On laryngoscopy the vocal cords were not visible as the voice could not be produced. A soft gum-elastic catheter could not be passed upwards from

the tracheotomy opening. The margins of the wound were irritated and breathing through the cannula when clean was free and unrestricted. Respiration through the mouth was quite impossible. The general condition was good. The treatment at T consisted in renewing and cleaning the cannula. An attempt was, however, made to close the cannula in part by means of a cork with a notch in it. The patient was sent to Halle for special treatment on Oct. 22nd. On Oct. 23rd it was found that besides the wounds in the neck the patient had been also shot in the arm. In the region of the larynx there was found at the height of the cricoid cartilage in the middle line and 3 cm. further to the left reactionless electric arcs each of the size of a pfennig. Below the cricoid was the opening in the trachea in which there was a cannula without an inner tube. On examination of the larynx there was seen extreme redness of the epiglottis, the margin of which was flexed backwards. The vocal cords were scarcely to be recognised, the right one seemed especially swollen and red. The patient was at first treated with inhalations of Al. a. salt, but in the course of the first day he complained suddenly of difficulty in breathing. The old cannula was then taken out and a new one with an inner tube put in its place.

On Oct. 24th under local anaesthesia of the neck and larynx, as also of the tracheal fistula, an attempt was made to carry out direct examination with the help of a laryngoscopy tube. This however brought on severe cyanosis and dyspnoea, which made it necessary to re-introduce the cannula. For some time little change took place in the larynx. Respiration through the larynx with a fenestrated cannula could only be carried out for one breath with the greatest effort and with loud cyanotic stridor. Roentgen photography of the larynx with a soft tube (in fencer's attitude) was taken with an exposure of eight seconds and it showed distinct changes in the lower parts of the larynx. When the picture taken is compared with a photograph of a normal larynx it can be recognised that in the lower part of the larynx and exactly in the region of the cricoid cartilage there is a difference perceptible, which shows that the cricoid cartilage at this place has been broken up by the shot, while in the normal larynx the arch of the cricoid can be distinctly outlined and clearly differentiated through the bright part of the ligamentum conicum from the lower margin of the thyroid. This part is completely wanting in the wounded larynx. The plate of the cricoid appears to be preserved and marked off in front by an irregular line. On the attempt to find a way from the tracheal fistula upwards into the larynx only a very fine rounded probe could be passed. Taking together these observations along with the Roentgen pictures it seemed clear that as the result of the wound there was a very high degree of stenosis of the subglottic space or it might be of the upper part of the trachea. As it seemed out of the question to make the larynx pervious by dilatation from the mouth, it was decided to carry out a laryngo-fistula and to excise the cicatricial tissue which had already been recognised and then to endeavour to open the tube of the larynx by means of Thoms's or Brüggemann's bolt cannulas. Before this was carried out the growth like thickenings which had formed in and below the tracheal cannula and the lateral walls of the trachea were punched away with a conchotome under cocaine and adrenalin anaesthesia. On Nov. 20th under scopolamine and pantopon narcosis and local infiltration anaesthesia, along with cocaineisation of the larynx the proposed operation was carried out. The incision through the skin and soft parts beginning in the middle line above the upper margin of the thyroid cartilage cutting down to the cartilaginous substance, was extended to the tracheal opening. By a puncture below the middle of the lower margin of the thyroid cartilage the subglottic space was opened and the crico-thyroid artery divided and ligatured. From the subglottic space a bougie was passed from above downwards into the trachea. The soft parts lying on the bougie were then cut through with the knife. These consisted of firm connective and cicatricial tissue in which here and there were small particles of cartilage. In order to keep the margins of the wound better apart the thyroid cartilage was cut in the middle line from below upwards for about 1 cm. with the scissors up to about a anterior commissure of the vocal cords. The tissue was excised with a conchotome knife and scissors until a lumen of about 1 cm. in diameter was produced. By probing from above it was ascertained that the way to the larynx was quite free. Thereupon a cylindrical firm corse pressed tampon of iodoform gauze of the thickness of the little finger was inserted and its upper part pushed up to the height of the glottis. Then the whole of the outer wound was united by stitches and a tracheal cannula introduced. The patient complained of very little pain during the operation. During the few following days the pain was, however, more considerable, and mucous secretion stained with blood was coughed out in considerable quantity. On Nov. 24th the stitches were removed and some purulent secretion evacuated from a stitch. After the removal of the iodoform gauze tampon Thoms's bolt No. 5 with the corresponding cannula, was introduced. The patient was free from fever and complained only of pressure pain. Two days later the tampon and cannula were removed and were replaced by cannula and bolt No. 7. There was no discharge from the stitch. On Dec. 1st bolt No. 8 was introduced without any great difficulty, and the operation wound had completely healed. During the next few days the patient complained only of a slight feeling of pressure in the region of the larynx. On Dec. 8th bolt No. 9 was introduced, the patient felt well on the whole, and had no special discomfort in the neck.

Professor Denker comments. As regards the prognosis in this case there seems every prospect that with suitably long-continued dilatation it will be possible to again establish respiration through the larynx, but it is scarcely to be expected that the vocal function can be restored. From the nature of the wound it would appear that on both sides the lateral crico-arytenoid as well as the crico-thyroid muscle had been considerably damaged and their functions quite destroyed. There is further a possibility that the recurrent nerve even if not damaged, has been probably contused or dragged. It is, therefore, extremely doubtful whether a loud voice could ever be restored though it appears according to observations made after complete extirpation of the vocal cords and removal of parts of the larynx still somewhat possible that the patient may later acquire a voice which, though by no means normal, may yet be intelligible.

and prepared only
from the finest
selected cocoa

(Cadbury Bournville.)

GALE'S COMPOUND SYRUP OF THE GLYCEROPHOSPHATES with PURIFIED EXTRACT OF OX-BONE MARROW PALATABLE, STABLE, EFFICACIOUS

An elegant combination manufactured from specially selected and purified materials only. It has been found a most useful preparation for fortifying the constitution against infection, and has given gratifying results in the various forms of Anæmia, Debility, &c

DOSE One teaspoonful.

ELIXIR ZYMETOS CO. GALE'S.

A very palatable combination of enzymes, extremely useful in assisting the digestion of weakened constitution, and aiding the nutrition of patients convalescent from long and severe illnesses.

DOSE Half to two teaspoonfuls well diluted after meals.

THE SALVARSAN & NEOSALVARSAN

Effective Substitutes.

GALYL

GALYL is Tetraoxydiphosphotetraaminodiarsenobenzene and was discovered by Dr. MOUNEYRAT

It is found in the form of a pale yellow powder, liable to change when exposed to the air

GALYL is as effective as SALVARSAN or NEOSALVARSAN on Spirochaetes and Trypanosomes, more rapid in action, and free from the neurotropic and congestive action of these preparations

For INTRAVENOUS INJECTIONS —

- (1) **DILUTE** — GALYL is supplied in neutral glass ampoules containing the necessary dose of Sodium Carbonate. Sterile distilled water only being used for the dissolution
- (2) **CONCENTRATED** — A special outfit containing one dose GALYL, one ampoule sterilised solution, and one small filter is supplied

Doses 0.20—0.25—0.30—0.35—0.40

For INTRAMUSCULAR INJECTIONS GALYL is supplied in only emulsion

Doses 0.20—0.30—0.40

HECTINE

HECTINE is Sodium Benzo sulpho-p amino phenyl arsonas

HECTINE consists of colourless needles, very soluble in water, containing approximately 21 per cent of arsenic

The preparation is put up in sterile ampoules for INTRAMUSCULAR INJECTIONS —

AMPOULES A containing 10 cg in 1 cc

AMPOULES B " 20 cg in 1 cc

PILLS (in Phials of 24) 10 cg

Ref THE LANCET 28/6/15—
Severe cases of intractable syphilis treated satisfactorily with Hectine

HECTARGYRE

Mercurial salt of HECTINE, a combined arsenico mercurial treatment of Syphilis, especially recommended after a course of Galyl

The preparation is put up in sterile ampoules for INTRAMUSCULAR INJECTIONS —

AMPOULES A containing
Hectine 10 cg in 1 cc
Hg 1 cg

AMPOULES B containing
Hectine 20 cg in 1 cc
Hg 1½ cg

PILLS containing
Hectine 10 cg

CUPRASE

CUPRASE is a colloidal copper hydroxide which is obtained chemically by the reduction of salts of copper in the presence of albumosic acid

THE MEDICAL TREATMENT OF CANCER.

Revue Moderne de Medecine et de Chirurgie

As a result of over ten years' research work on Cancer Dr Gaube du Gers produced a new Colloidal Copper Hydroxide which has given remarkable results in arresting the progress of the disease, with loss of pain, and great improvement in the general condition of the patient. Locally, these results are manifested by a transformation of the lesions leading to their cicatrization, in a greater or less period, to the diminution in their size, and finally to the disappearance of the diseased glands. Dr Gaube du Gers Cuprase is employed in subcutaneous injections made *very slowly* in the gluteal region, with a needle of about 0.03 cm at the rate of an ampoule every four days which should be continued in the same manner as long as necessary. These punctures are not generally painful and do not produce any local reaction. Cuprase is not toxic.

Extract from Proceedings of the Royal Society of Medicine, February, 1913 —

Dr GEORGE HERSCHELL

There are two kinds of colloid copper. The electrically prepared colloid which is manufactured by passing an electric arc through copper plates immersed in water and the chemical colloid which results from the slow reduction of copper in the presence of albumosic acid. Theoretically, the electric colloid should prove most efficacious, as the particles of copper are reduced to the finest state of subdivision. Clinically however, the chemical colloid appears to give the best results. In the following cases chemically prepared colloid was used. Experimentally, it has been proved (1) That particles of colloid copper can be demonstrated in the granulations of cancerous growths after two or three injections of the colloid, and clinically (2) There is invariably great relief from pain, (3) Appetite and strength return and the patient puts on flesh, (4) There is in many cases a diminution in the size of the tumour, (5) The injections are absolutely non toxic, although in many cases an inflammatory reaction is manifested in the cancerous growths.

As regards my own personal experience in the use of this method of treatment in addition to my own cases I have had an opportunity of observing the effects in the practice of some of my medical friends, and in nearly all cases the progress of the disease appeared to be arrested.

CUPRASE is put up in boxes containing 8 ampoules of 5 cc each

The State Treatment of Venereal Diseases

AT the recent session of the British Medical Association a recommendation was approved by the Representative Meeting that arrangements should be made for confidential registration or certification of the causes of death, this being one of the proposals of the Royal Commission on Venereal Diseases. Until such registration and certification can be made fearlessly and candidly by medical men the public will not appreciate the far spreading mischief of venereal diseases, but it is absolutely necessary that on the one hand the feelings of the public should be as far as possible protected, and on the other that medical men should run no risk in discharge of their duty. The State intervention in respect of venereal diseases depends for its success mainly on these two factors, whether we are considering prevention or treatment, and a third factor will be the prompt ascertainment of the amount of work that lies before us all, as gauged by the prevalence of pathological conditions. The Representative Meeting also endorsed the recommendation of the Royal Commission with regard to the keeping of uniform records in all sickness institutions, and this recommendation veiled an indictment of a great many hospitals, some of them being among our best-managed charities. If the statistics tabulated from death registers by the Registrar General cannot be claimed as yet to afford any close measure of the amount of mortality from venereal diseases, still less, unfortunately, do hospital records give absolute information. If the Local Government Board can devise a system for the use of hospitals and Poor law establishments by which accurate statistical information can be obtained as regards the prevalence of these diseases among the persons who receive institutional treatment a great step forward will be taken. For it must be remembered that we are as yet a little in the dark as to the extent of the mischief which is now to be combated by a thorough going alliance between medicine and the public. The matter is one upon which the widest differences of opinion have been expressed, for while one man's experience seems to indicate that, speaking here of syphilis alone, the amount of disease has much decreased in the last generation, another, with apparently an equal right to speak, will suggest that there is a general syphilisation of the population. We incline to the optimistic view, which is supported by the curves of mortality from

syphilis in England and Wales for the last 30 years, but what is required, if only having regard to the colossal sums of money that will have to be spent, is a definite knowledge, as far as possible, of the extent of the evil now. In this way when progress is made its amount and its direction can be ascertained, so that expenditure may be open handed in the indicated places, while being properly checked in places where, in the absence of information, it may be embarked upon ill advisedly.

Dr J. A. MACDONALD, chairman of the Council of the British Medical Association, raised the question which has, we know, occurred to many of our readers—namely, What part the general practitioners of the country were going to have in dealing with venereal diseases? And other speakers at the meeting expressed apprehension lest the public health authorities should take over the whole of the work, laying down rules which the medical profession would have to carry out. If this should result from the expression in law of the recommendations of the Royal Commission on Venereal Diseases we are certain that it will be contrary to the wishes of the Commissioners as a body, and contrary also to the inclination of the public. Some of the Commissioners, we are sure, regarded it as essential for the satisfactory working of any scheme for the prevention and treatment of venereal diseases that the local medical practitioners should be entrusted with a full share in the organisation set up by the State to be worked out by the medical profession. The National Committee for Combating Venereal Diseases would certainly support the claims of the general practitioner in this direction. Having regard to one aspect of the matter only, a majority of the more obscure cases will, in the first instance, come before the general practitioner. When the patient himself—of course, all that follows holds good for both sexes—knows what his condition is, he may be able to have recourse to any treatment centre that he chooses, his convenience and his privacy being consulted as far as possible—so far, indeed, that a direct invitation to hospital abuse will be given unless methods of careful regulation are adopted. But where he is ignorant of his plight he may consult a private practitioner, who having diagnosed the case, will advise as to the next proceeding. Now in these cases, as in the cases where institutional treatment is sought at the onset and where the patient is later discharged to complete a cure under a private practitioner, it is necessary that the practitioner should know the whole details of the treatment undergone at the institution. It was moved at the Representative Meeting of the British Medical Association that when a patient is discharged from an institution "it is imperative for the continuity of treatment that a report as to his treatment during his attendance at the institution should be kept at the institution, and that a copy should be at the disposal of any medical practitioner who applies for it with the sanction of the patient." This is a most valuable recommendation. If continuity of treatment is thus preserved the part played by the general practitioner in stamping out syphilis will be of the first importance, both really and in the eyes of the

public, while all medical men will be placed steadily in possession of the details of therapeutic technique. The British Medical Association proposes to make representations immediately to the Local Government Board explaining the issues here involved, and seeking that every local authority, when dealing with the treatment of venereal diseases, shall be compelled through all stages to take effective counsel with the local medical profession.

In Western Australia interest in the problems of venereal disease has assumed practical expression in the form of an Act (1915) to amend the Health Act, 1911-12, and continuity of treatment is thus secured for the patient. We are indebted to the Commissioner of Public Health of Western Australia for a copy of this Act, and for an account of the steps taken by the Department of Public Health to facilitate its working. The system of "anonymous" notification of venereal disease provided by this Act is not a novelty, it has already existed for several years in Sweden, where the information thus obtained has given valuable data as to the prevalence and distribution of venereal disease. In Western Australia compulsory notification is now followed up by a form of compulsory treatment, the patient may choose his own doctor and go from one doctor to another, but he is bound to remain under medical supervision until he has received a certificate of cure. To ensure continuity of treatment, the doctor who takes over a case from a fellow practitioner has to notify him of the transfer, and a special form is provided for these notifications from one practitioner to another. The original medical attendant is thus in a position to know whether his patient has gone to another doctor for treatment or has given up treatment under medical supervision. When a patient has absented himself from treatment for a period of six weeks the Commissioner of Public Health is notified, and under certain conditions the patient may have to undergo detention, compulsory examination, and treatment. The Act also provides free examinations, including Wassermann's reaction. From the principal features of the Act it is evident that it encroaches considerably on the freedom of the individual, as formerly understood, but this loss of personal liberty will be compensated for by an appreciable reduction of venereal disease. The Act bristles with penalties, and from the time a patient goes to his first doctor for advice to the time that a certificate of cure is issued, he has to run the gauntlet of potential fines and imprisonment. In many, perhaps most, cases the patient may be quite satisfied to be shepherded in this patriarchal fashion, but there is a risk lest a certain proportion may so dread this compulsory pilgrimage to health that they will refuse to seek medical help, or seek it at a late stage of the disease. This is a risk which it is absolutely necessary should be avoided in the working of the new legislation in this country, and avoided it will be in the most satisfactory fashion if the principle of cooperation between the State and the general practitioner is kept steadily in sight.

Bone Grafts and Ununited Fractures

A SPECIAL meeting of the Surgical Section of the Royal Society of Medicine was devoted recently to the subject of bone grafting. For many years the problem of how best to deal with ununited fractures has engaged the attention of surgeons, and the attempted solutions have been many, but it has been left to our own day to devise measures on which we can rely to produce results ensuring the life of the patient and the utility of his limb. The circumstances of the war will put such a claim to great trial, but, none the less, it can fairly be made. When we look into the methods which have been in the past employed we find that for centuries a technique—any technique—not requiring a breach of the skin was preferred, indeed, surgical interference was hardly seen at all, the wholesome fear of septic infection deterring most surgeons from undertaking operations on bones. At one time salts of lime and magnesia were credited, when administered internally in large doses, with great power in hastening the union of fractures, but the evidence in favour of this view was by no means strong, and to day we hear little about it. When the surgeon ventured on local treatment he preferred not to pierce the skin. Rubbing the ends of the bones forcibly together was tried at some schools, THOMAS, of Liverpool employed beating the site of the fracture with a copper mallet, the skin being protected by leather, and the results in many cases were not at all bad. BRODIE was in favour of applying a blister to the part, and CLINE used caustic potash over the surface corresponding to the fracture. The next advance in importance was the attempt so to irritate the structures between the ends of the bone as to excite a lively inflammation and thus to lead to the formation of new bone. Stimulating injections were employed, such as silver nitrate and tincture of iodine, and some successful results were reported. Then acupuncture was thought of by MILLER, of Edinburgh, a cataract needle or a long and narrow knife blade was passed in between the ends of the bone and the surfaces were scarified so as to freshen them. Next AZAM and LEVTE combined the use of electricity with the employment of needles, by sending a current of electricity through the needles after they had been introduced. In many cases each of these methods gave successful results, though in some of those in which electricity was used much suppuration was present. PRYSICK introduced the use of the seton in the treatment of ununited fracture, a silk ribbon being passed between the ends of the bones, according to others it sufficed if the seton were placed close to the ends of the fragments. PRYSICK advised that the seton should be left in place for several months but less time than this usually sufficed. The danger was by no means small, good union followed in many of the cases, but death sometimes occurred. SOMME, of Antwerp employed a wire loop in place of the ribbon or thread, and claimed to have obtained satisfactory union, but in so far

as all these devices depended on the amount of inflammation set up, it is probable that the less septic wire would be a less efficacious instrument

Such were the early designs for dealing with the mortifying situation of an ununited fracture. So far all the attempts made had dealt with the material between the ends of the bone, and nothing had been done to the bone itself. Next we may put operations aiming at irritating the bone, so as to make it take on a bone forming action. Arabian surgeons, many years ago, are said to have laid open the site of the bad union and to have dissected off the fibrous tissue intervening between the broken ends, if so, WHITE, of Manchester, was not, strictly speaking, a pioneer, when, in 1760, he cut down on the ends of the ununited bones, sawed them off, and having thus removed all the intervening fibrous tissue, freshened the ends so as to start an active bone formation. Later HOREAU in 1805 added to WHITE'S operation the drilling of the two fragments and their fixation by a wire. Others applied caustics to the broken ends. These open operations, however, met with little favour, for they were accompanied by the profuse suppuration which followed at that time compound fractures, and not only was necrosis of the bony ends liable to occur, but the septic complications were not rarely fatal, while even in successful cases recovery was very slow indeed. Open operations were little used until the introduction of antiseptic surgery permitted their employment by removing the danger of sequelæ. Attention was next devoted to subcutaneous operations on the bone. The ends of the bone were drilled with an awl, and in order to cause more irritation DIFFENBACH drilled the bones close to the fracture and drove into the holes conical ivory pegs with a mallet, these pegs were not intended to fasten the fragments together, but merely to stimulate the bone to the formation of more ossification. The pegs were generally removed after a few weeks when they had become loosened by the absorption of the surrounding bone. The method was useful but by no means free from danger, for death sometimes followed its employment. In 1854 BICKERSTETH modified the method by drilling through both fragments, so that the pegs passed from one to the other and thus held the pieces together. DETMOLD simplified the operation by drilling through both fragments, leaving the drill *in situ* until the union was well advanced. Little further advance can be recorded until the advent of Listerism. Surgeons occasionally laid bare the ends of the bone and wired them together, but the sepsis which followed was usually so profuse that the operation was only attempted in cases in which all milder measures had failed. With the almost complete certainty of the exclusion of septic organisms afforded by antiseptic surgery, the surgeon was in a very much better condition to attack ununited fractures. LISTER himself led the way in wiring recent fractures of the patella, and the same method was applied to ununited fractures. The results were on the whole, sufficient not only

to justify the practice, but to show that a trustworthy method of treatment of ununited fractures had been found. Yet the new method had some disadvantages. The process of wiring was not always easy, and a number of cases occurred in which it was quite impossible to retain the fragments in position by wires. Various modifications or mechanical dodges were tried. Tubes of metal or bone were slipped over the ends of the fragments, and in some cases were efficient. Bone or metal plugs were placed within the medullary cavity and occasionally sufficed to produce the required firm union, but the practical difficulties in the employment of all these methods were great. That the mischief of the ununited fracture could be remedied under the advantages of asepsis was clear, but it was not so clear what was the best procedure to be adopted in different cases. The credit of placing the treatment of ununited fractures on a sound basis must be given to Sir ARBUTHNOT LANE. He has dealt by his plan of plating not only with ununited fractures, but also with recent fractures where there was difficulty in placing the fragments in good position, displacement of the fragments being the most potent factor in the prevention of bony union. By the use of the plates which he devised, and by the insistence on the details of an elaborate technique, he and his followers have attained to a very high degree of success. Though there is still some measure of controversy as to the cases of recent fracture which should be submitted to these operations, there is a wide agreement that most of the results obtained can hardly be surpassed. Both before and since the introduction of Sir ARBUTHNOT LANE'S procedure other surgeons have invented ways for dealing with fractures by drilling and nailing, and these have given satisfaction in a large number of instances. Among the more recent methods may be mentioned that devised by Mr E. W. HEY GROVES¹, he employs an ingenious method of traction of the fragments so that they can with but little trouble be brought into good position. A recent exponent of innovations in the treatment of ununited fractures is Dr FREDERIC ALBEE, of New York, and British surgeons had an excellent opportunity of seeing a cinematographic exhibition of his practice at a lecture given by him at the rooms of the Royal Society of Medicine at a special meeting of the Surgical Section. He employs bone grafts, and these, of course, have been used before, with a varying measure of success, owing to their employment in a more or less haphazard way. No surgeon before Dr ALBEE has devised the instruments for the task or mastered the details needed to make the operation a success. Some of his earlier work has been with bone grafts for the fixation of the spinous processes in caries of the spine, an operation which has accomplished much in the treatment of spinal caries, but the relative value of which is still undecided. He has now proceeded to the treatment of ununited fractures on analogous lines, and his demonstration must have gone far to convince many hitherto

¹ THE LANCET, Feb. 21st 1914 p. 517

doubting surgeons as to the real value of his ingenuity. By ordinary methods of preparation the bone graft is so damaged that its vitality is much diminished, but with the ingenious instruments of Dr ALBEE the preparation of a bone graft becomes wonderfully easy and a matter of only a few minutes. The main point in bone grafting is to have the graft as free from injury as possible, and this Dr ALBEE accomplishes as follows. The groove in the broken bone which is to be filled by the graft is cut by the use of two parallel circular saws driven by electricity. These form parallel cuts in the broken bone, extending on each side of the fracture as far as is required, and reaching down to the medullary cavity. By means of a small circular saw a cross cut is then made at each end of the former cuts, and then the piece of bone can easily be lifted out. Similar saw cuts are then made on another bone, preferably the tibia, so that a piece of bone exactly the same size as the other is obtained. This can then be placed in the groove of the broken bone, the surgeon can be certain that it will fit, and the graft is cut so quickly that it receives no injury and its vitality is in no way impaired. The extensive experience that Dr ALBEE has already had with his method and the success which he has obtained are amply sufficient to require that his procedure should be thoroughly tested.

A contemplation of the various means which have been employed for the treatment of ununited fractures excites admiration for the ingenuity of the many devices which have been used from time to time. Certain of the older of these have been discarded, some because the danger has surpassed the benefit, some because the results have not come up to the expectations to which they had given rise, and some because better methods have been devised coincident with increased knowledge of physiology and of the causes of inflammation. Of the several procedures which are now before the surgeons of the world time will decide which is to be accepted—and the time may be shorter than is generally required for similar decisions, owing to the lamentable amount of material which will be under our hands. It may well be that, owing to multifarious experience, some new mode of dealing with these troublesome cases will be brought before us. In estimating the relative values of the various methods it must always be borne in mind that a surgical procedure can only be judged by the results obtained by following implicitly the instructions of the author. For that reason Dr ALBEE's demonstration before the Surgical Section of the Royal Society of Medicine was of especial value.

GAZETTE OF THE 3RD LONDON GENERAL HOSPITAL

—The August issue of this journal contains a valedictory note by the Commandant, Colonel H. E. Bruce Porter who is taking out to the East a 1040 bed hospital with a staff of Territorial medical officers. He asks that the confidence and loyalty given to him by his past staff at the 3rd London may be equally accorded to his successor Sir Alfred Pearce Gould. The other contents of the journal include the usual letterpress and pictures, mostly humorous. The price of the publication which can be obtained at the hospital at Wandsworth is 3d.

Annotations.

"Ne quid nimis"

BELGIUM AND THE MEASURES FOR ITS RELIEF

IN order to ascertain at first hand the condition of Belgium under German occupation and the actual fate of the supplies for the relief of a population, to which the American nation has generously contributed, Mr A. J. Hemphill, a well-known New York banker, has visited Belgium, after securing in Berlin permission to do so. His report which has now been published, is, in one respect at any rate, of a satisfactory character. He is convinced that, in spite of opposition from a section of German critics of the situation, the food contributed for the relief of the Belgian population is, in fact, devoted to that end, and that the home grown food supplies of the country are also being consumed by its citizens. This last was made by the Allies a condition of the continued permission of food imports, and it had the sanction of the German Chancellor in spite of opposition based upon the shortage of food in Germany itself. As to the necessity for the relief given, Mr Hemphill declares without hesitation that the appearance of normal existence which he found prevailing, and which particularly impressed him when he arrived at Brussels, is an appearance only. Such manufactures as are still carried on do not affect more than a small section of the people, and the look of apparent well-being is only maintained through the pouring in from outside of supplies to the value of £1,200,000 per month, in the distribution of which well-dressed men, women, and children claim their share as well as those outwardly needy. Mr Hemphill places at 600,000 the number of children in the country entirely dependent upon the open-handed liberality of the outside world. The supply of milk for them has constituted a serious difficulty, but a system has been started by which peasants keeping cattle have each lent a cow without charge. These have been placed in communal herds, that at Antwerp numbering over 400 head. The cows are to be returned to their owners in due course, or compensation paid for their loss. The report of an independent observer, well qualified to examine the matter from a business-like point of view, should do much to satisfy everyone as to the absolute necessity that the relief funds should be maintained, and as to the fact that they are not being diverted either directly or in effect, to sustain those for whom they are not intended. The gratitude of devastated Belgium and the knowledge that lives have been saved and a good deed well done will be the reward of Mr Hemphill's countrymen and of all who have contributed.

THE EFFECTS OF TRI-NITRO-TOLUENE ON WOMEN WORKERS

It would be surprising if the constant handling of a nitro compound were not without some injurious effect upon the health of a proportion of workers, but as a very careful investigation of the results of which we publish in a paper this week shows, the toxic symptoms here and there manifested are not widespread and moreover can with suitable precautions be avoided.

the majority of cases they yield to treatment. It has been well established that the chances of risk to health involved in the conduct of more or less poisonous trades can be minimised if the factory hands if they will adopt the precautionary measures laid down by the Home Office authorities, while this same department is insistent, as a rule, on the provision of ventilation and all appliances needed to keep down or remove dust or fumes in those industries in which they may arise. Mr Agnes Livingstone Learmonth and Dr Barbara Martin Cunningham, women medical officers in the munition factories, point out that in the tri-nitro-toluene filling sheds the work necessitates intimate handling of the powder, and the more floury or fine the powder the greater the amount of dust in the air of the shop. In addition they suspect that the volatile product is given off under certain conditions of temperature and moisture. According to the evidence of some workers, the effects of the powder are more felt on night work, and this may be explained by the fact that ventilation, as a rule, is less free at night, owing partly to the air being too cold to allow of opening the windows freely, and partly to war conditions which necessitate the darkening of factory windows at night. The report is a very valuable one, and is the result of a thorough and painstaking inquiry, while the simple and effective suggestions made as to prophylaxis should, if adopted, confer an increased immunity on the workers from the toxic attacks of the powder. The injunctions laid down as to the importance of good and plentiful feeding, of personal cleanliness, of rest, of reduced night working, of protecting the person by overalls and so forth, are sensible and sound. It is so often the case that it is the neglect, on the part of the worker, to follow such simple precautions which leads to a disturbance of health. They are offered authoritative help, but refuse to help themselves, and the observance of such regulations can be made with little personal inconvenience and be still consistent with a maximum output of munitions.

ACUTE POLIOMYELITIS

REPORTS of increased prevalence of acute poliomyelitis come from New York and from Dr Matthew Hay, medical officer of health for the city of Aberdeen. The actual number of cases notified does not appear to be large in either case—48 in the former and 39 in the latter, but the number of cases known to have occurred in June and in the first week of July suggests the beginning of an epidemic and that a greater prevalence is likely to occur in July, August, and September, for it is almost a constant feature for the incidence of poliomyelitis to be greatest in the months of July, August, and September. In the London area in 1912 the disease reached its greatest prevalence in July in 1913 in September, in 1914 in August, and in 1915 in October. It is the early recognition and isolation of the first cases which are of such importance, for all the clinical and experimental evidence goes to prove that the disease is transmitted through direct contact from acute cases or carriers and not by flies or vermin. The difficulty of determining the carrier is very great, for the only test which at present we possess for detecting the virus is the experimental one—viz the injection of the filtered secretion into monkeys. Now this method cannot be completely relied on even in the hands of the expert

investigator, and it certainly cannot be largely employed, for each operation would necessitate the sacrifice of at least one monkey. But though recognition of carrier cases is hard, prevention of the disease is not. The secretion from the nasal and buccal cavities is nearly always the source of infection, the virus is easily killed by dilute solution of potassium permanganate (1 in 2000), and in order to prevent infection the nasal and buccal cavities can be frequently washed out with this solution. The disinfection of the other excretions of the body and of the bedding and clothes can be carried out in the usual method as applied to any infective case, but it is to the buccal and nasal secretions that the chief attention should be paid. It is important to recognise that individuals in contact with the infected may acquire the disease in an abortive or modified form without any paralytic phenomenon, and it is therefore essential that all those in contact with the acute disease should take precautions to disinfect the nasal and buccal secretions. From a consideration of the epidemiological feature of the disease there appears to be little doubt that the population of the British Islands generally, and adults especially, are immune or have acquired an immunity to this disease. This immunity would seem to have been acquired by the constant presence of the disease in an endemic form, for when it arose as it did in the island of Nauru in the South Pacific it attacked the native adults in a severe form. If Dr Hay, by taking precautions in the early cases with which he has met, can prevent the spread of the epidemic, and at the end of the year it will be possible to judge, he will deserve the most grateful thanks of the community, for he will have saved numerous children from the disastrous consequences of the disease.

EPIDEMICS RESULTING FROM WARS¹

WE have received a volume with this title issued by the directors of the Division of Economics and History of the Carnegie Endowment for International Peace, an organisation intended to "promote a thorough and scientific investigation of the causes and results of war." This monograph, from the pen of Dr Friedrich Prinz, on epidemics resulting from wars is designed to bring into light an aspect of international conflict that has never been adequately appreciated. An examination of the facts here presented will indicate that until comparatively recent times the most serious human cost of war has been not losses in the field, nor even losses from disease in the armies, but the losses from epidemics disseminated among the civil population. It was the war epidemics and their sequelae, rather than direct military losses that accounted for the deep prostration of Germany after the Thirty Years' War. Such epidemics were also the gravest consequence of the Napoleonic wars. In an introductory note John Bates Clark, one of the directors, expresses the opinion that "when the medical history of the present war comes to be written it will be found that the aggregate losses from sporadic outbreaks of war epidemics have been very considerable. A war sufficiently protracted to lead to universal impoverishment and a breakdown of medical organisation would be attended,

¹ Epidemics Resulting from Wars. Clarendon Press, Oxford, 1916. pp. 346. price 7s. 6d. net.

as in earlier times, by a whole series of devastating epidemics." And he instances, in support of this belief, the small pox epidemic following the Franco-German War. In 1870 the means of coping with small pox were quite advanced. This fact did not save Europe from a widespread epidemic, entailing human losses exceeding in gravity the losses in the field. The history of this epidemic is described at considerable length in the book, in Germany alone there were over 171,000 deaths in the years 1871-2 out of a population of about 41 millions. Epidemics also occurred in Switzerland, Belgium, Holland, Austria, and Italy, while in Great Britain and Ireland the mortality due to it was 10.1 and 8.3 per 10,000 inhabitants during the same two years. For Germany this disastrous epidemic had one good result, it led to the passing of the Imperial Vaccination Law in 1874 which rendered vaccination compulsory. The beneficial result of the passing of this law was clearly demonstrated in the course of the following decades. Notwithstanding the fact that Germany is almost entirely surrounded by States to which epidemics of small pox, in consequence of insufficient vaccination, are of frequent occurrence, since the passing of this law the disease has not once made its appearance on German soil in the form of a wide spread epidemic. As the author justly remarks, the measures which are so effective in the case of other diseases—isolation of the patients and of suspected persons living in the vicinity, disinfection of the room and effects which have been used by patients—in an insufficiently vaccinated community do not have the desired rapid success, since the contagion of small pox clings with extraordinary tenacity to clothes and articles of general use. The volume contains interesting details of epidemics resulting from wars, from the time before the 'Thirty Years' War to the Franco-German War of 1870, and also from those subsequent to it, the Russo-Turkish, Boer, Russo-Japanese, and the Balkan. In conclusion, the author recommends that all preparations designed to prevent the outbreak and dissemination of infectious diseases must be made in times of peace. For the military authorities, who can scarcely perform all the duties that the beginning of a war imposes upon them, it will facilitate matters greatly if in future campaigns the Red Cross devotes its attention, not only to the care of the wounded, but also, on a larger scale than it has heretofore, to the prevention of the outbreak and dissemination of war pestilences.

THE ETIOLOGY OF EPIDEMIC CEREBRO-SPINAL MENINGITIS

THE causal micro organism of epidemic cerebro spinal meningitis has been the object of much research and discussion. Several organisms have been isolated and claimed as the specific microbe of the disease. Of these the most commonly found is the diplococcus intracellularis meningitidis of Weichselbaum, generally known as the meningococcus, and amongst others may be mentioned the pneumococcus, an encapsulated streptococcus, and an organism similar to the diplococcus crassus. There is no difficulty in admitting that sporadic cases may be caused sometimes by the pneumococcus, sometimes by the meningococcus. But as regards the epidemic form it seems very unlikely that such a definite disease as epidemic cerebro spinal meningitis could be caused by more than one organism, and the bulk of observers are of the

opinion that the meningococcus is the germ responsible. In another column we publish a paper by Mr M. F. H. Gamble, medical superintendent, Hospital for Insane, Kew, Victoria, Australia, maintaining that the organism causing the disease is "practically identical with the gonococcus, a mutant form perhaps." Though fully aware that this suggestion is contrary to the opinion held by other observers we have decided to publish it, as Mr Gamble expresses his views in very decided terms. Moreover, this is not the first time that such a suggestion has been made, but the arguments raised against it have been weighty. Although morphologically the meningococcus and gonococcus cannot be distinguished, yet their other properties are different. The meningococcus is pathogenic for mice, whilst the gonococcus is not. Their cultural characteristics are different, as are the agglutination and complement fixation reactions. Further, some interesting researches reveal that the inoculation of the second generation of the meningococcus inserted into the urethra of five investigators failed in every case to produce gonorrhoea, while even the twentieth generation of the gonococcus produced the disease. Mr Gamble, however, goes farther than this and states that the disease is almost certainly conveyed from one person to another by lice and by no other channel. We are not aware that this channel of infection has been previously suggested and it cannot be accepted without further proof. We do not think that Mr Gamble's argument carries conviction, and a very obvious question arises. If he is correct in his theories, how is it that, although in this country gonorrhoea has always been very common, yet cerebro spinal meningitis is comparatively rarely met with? We are afraid that it cannot be answered by saying the lice are so rare!

ERYTHEMA NODOSUM IN MILIARY TUBERCULOSIS

IN a number of the *Svenska Lakarsällskapet Handlingar* (Stockholm, 1916, xli, p. 2) dedicated to Professor E. Holmgren, the Swedish histologist, on his fiftieth birthday, G. Brun and J. Tillgren record an unusual case of generalised tuberculosis. The patient, a working woman, 43, developed cough and general debility in December, 1914. In the following January she had swelling and tenderness in the joints of the hands and elbows, identified by the authors as the "tuberculous rheumatism" of French medical writers. Soon the knees and feet were similarly attacked, first on one side of the body and then on the other, and the patient took to her bed for months, suffering much pain during the first week. While convalescing from this attack she had pain in the joints of the shoulders and jaws and vertic headache. During all this period she exhibited skin eruption from time to time, consisting of small spots of the size of pins heads on the arms, legs, and back, lasting a few days and free from itching and tenderness. She came into hospital in 1915, apparently in August, having a fortnight previously had a typical outbreak of erythema nodosum on the extensor aspects of the arms and legs, the nodosities being hard, tender, and the size of plums. On her admission they were still present, though smaller than they had been during the first week of their presence and no longer tender. The patient was found to be well nourished and muscular, though she had

wasted considerably during the previous six months. The lungs showed nothing abnormal on physical examination, there was a systolic murmur over the apex of the heart, which seemed otherwise normal. The abdomen was distended but without localised tenderness, the liver could not be felt, the spleen was readily palpable, the urine did not give Ehrlich's diazo reaction and was free from albumin and reducing bodies. The blood count showed 3.1 million red cells and 3300 white cells per c.mm. and 55 per cent of hæmoglobin. Wassermann's reaction was negative, the fundus oculi was normal. Examination with the X rays showed dense shadows at the roots of the lungs but no other changes in the lung tissue. The patient was in hospital two months before she died, with irregular low fever, loss of appetite and strength, and latterly increasing abdominal distension. The leucopenia became more obvious, the number of white cells falling to 1100, 1200, and 1300 per c.mm., with 45 per cent of mononuclear cells. The diazo reaction and Weiss's urochromogen reaction appeared in the urine, cultures of the blood and the urine were made, but proved sterile. At the autopsy the spleen was found to be 10 inches in length and to weigh 2½ lb. It was soft and contained numerous tuberculous abscesses and areas up to the size of walnuts, the smaller grey in colour, the larger yellow and surrounded with zones of red. The lower lobes of both lungs each contained a calcified tuberculous area of the size of a bean, these the authors assume to have been the primary foci of infection, with spread to secondarily involved lymphatic glands at the roots of both lungs, one gland being calcified on the right side. Tuberculous glands were also found in the mesentery, portal fissure, abdomen and neck, and round the aorta. A guinea-pig injected with the contents of one of these glands had developed generalised tuberculosis when it was killed six weeks later. A second guinea-pig was inoculated in the flank with a piece of pigmented skin from one of the areas of erythema nodosum. Four months later the animal showed no signs of tuberculosis. Microscopic sections of the skin showed no obvious changes. The brain, liver, kidneys, pancreas, suprarenal glands, and bone marrow were normal in appearance. In their discussion of the case the authors describe the erythema nodosum as of the "ominous" form, and express regret both that it was not submitted to microscopical and bacteriological examination at an earlier date and that no complete tuberculin investigations were made. No general reaction followed a tuberculin injection administered at a time when the urine gave no diazo reaction. They remark that the case is not unlike those of tabes mesaraica in children, and resembles the glandular tuberculosis of apes described by Koch. They are continuing the examination of the tubercle bacilli isolated from the patient's lymph glands, which may prove to be of the bovine type.

WE regret to announce the death of Mr. Morton Alfred Smale, consulting surgeon, Royal Dental Hospital, and consulting dental surgeon to St. Mary's Hospital.

On August 3rd His Majesty the King visited Cambridge, and after inspecting various military units at the colleges made a long stay at the 1st Eastern General Hospital, where he showed great interest both in the patients and in the arrangements of the hospital.

THE SHIAH PILGRIMAGE AND THE SANITARY DEFENCES OF MESOPOTAMIA AND THE TURCO-PERSIAN FRONTIER

By F. G. CLEMON, M.D. EDIN., C.M.G.

BRITISH DELEGATE TO THE INTERNATIONAL BOARD OF HEALTH AND PHYSICIAN TO H.M. EXARIST, CONSTANTINOPLE.

I—INTRODUCTORY

IT is the merest platitude to say that the great war has wholly altered the relative values of all subjects of human interest. The matters dealt with in the present articles—which aim at summarising the labours of an International Commission which, in the winter of 1913-14, inquired into the sanitary defences of Mesopotamia and the Turco-Persian frontier—were at that time of very real interest and practical importance. At the present time such interest as they can claim must be very largely, but not wholly, of an academic character. For on the one hand, the regions of the world with which these papers deal have been swept by the flames of war, the Shiah pilgrimage, with which they are to a large extent concerned, if it continues to take place at all, must have sunk to insignificant proportions, and, briefly, many of the conditions they attempt to describe must, for a time at least, have ceased to exist. But, on the other hand, the regions in question are among the principal of the secondary theatres of the world war, and so claim a very special interest at this moment. Moreover, the cessation of the conditions herein described must, in the nature of things, be temporary only. The great lines of communication by the rivers of Mesopotamia or the roads across the Persian frontier will sooner or later become once more as they have been from time immemorial in the past, busy routes of pilgrimage and commerce, and their defences against the importation of epidemic diseases will require the careful consideration of the governing authorities to whatever Power these countries may belong after the war. The Shiah pilgrimage—far too essential a feature of this branch of Islam to cease altogether—will be more active than ever when peace reopens these regions again. And so a statement of the problems which their sanitary defences present and of the methods by which it was proposed just before the outbreak of the war to solve them, may be usefully made at the present time, though no attempt at applying the practical conclusions to which it leads can be made until the war is at an end.

The information upon which the present study is based was obtained under the following circumstances. In the winter of 1913-14 the Constantinople Board of Health despatched to the regions in question a special Commission, charged with the study of their existing sanitary defences and the means of reinforcing them. The Commission was composed of the British, Russian, German and Persian delegates and a Turkish member. It left Constantinople in November 1913 by a special steamer, which also conveyed several members of the Turco-Persian Frontier Delimitation Commission, whose labours in delimiting the exact line of that frontier synchronised with those of the Sanitary Commission. Basra, Bagdad, the Shiah holy cities of Kerbela, Nejef, and Kienmeim Khanikin on the Persian frontier, and many other places were visited and the Commission returned to Constantinople in the spring of 1914. Its report prepared by me as "rapporteur" of the Commission, was presented to the Board of Health in June, and was at once ordered to be printed. The printing was however still uncompleted when the rupture between Turkey and the Entente Powers led to the hurried exodus from Constantinople of most of the subjects of those Powers, and only the manuscript of the report could be saved.

It may be mentioned here that the idea of sending such a Commission was no new one. It seems to have been first broached in the International Sanitary Conference of Constantinople in 1866 by the Persian delegate, at the thirty-sixth sitting of that Conference. It was again put forward in the Mixed Commission for Revision of the Ottoman Sanitary Tariff in 1882. But though the proposal to send such a mission was definitely carried by that body, no practical effect was given to the decision. It remained for a later Mixed Commission (the nature of which will shortly be explained) to renew the proposal, and to re-open

successfully, and as a result two Commissions were sent. The first, consisting of the Russian, French, and Persian delegates, visited the northern third of the Turco-Persian frontier in July, 1911, and issued a brief report on its return to Constantinople, the second, whose labours form the subject of the present articles, was charged with a study of the sanitary defences of the southern two-thirds of the frontier, of Basra and the Shatt-ul Arab river, and of the dangers to public health offered by the movement of pilgrims and dead bodies to the Shiah holy cities, and the means of meeting those dangers.

In the course of these articles it will be shown that the only two lazarets or quarantine stations in these regions—those of Basra near the head of the Persian Gulf and of Khanikin on the frontier—were wholly inefficient and had been allowed to fall into a lamentable condition of disrepair. Their thorough reorganisation was among the principal recommendations of the Commission. That this condition had been brought about was mainly due to the peculiar circumstances of the financial relations between the Board of Health and the Turkish Government. This is not the place to describe those relations in full, but briefly it may be said that while the Board of Health was responsible for the cost of administering all the Turkish lazarets the cost of constructing and repairing the buildings of the lazarets was, under binding international conventions, at the charge of the Turkish Government. The latter had, however, evaded its obligations in this matter, and the peculiar position was thus brought about that, while the Board of Health possessed a very large reserve of money invested in various public funds, it was unable to spend any of this in putting the lazarets in repair without infringing the conventions in question. It was necessary, therefore, to modify those conventions, and such modification could only be effected by a body known as the Mixed Commission for Revision of the Ottoman Sanitary Tariff. This body has met on five occasions since 1869. It was last summoned in 1905, and subsequently to that date the Board of Health despatched a series of Commissions of Inspection to all the lazarets and sanitary stations of the Turkish Empire. Those Commissions, of which I have in most instances been a member and "rapporteur," produced reports containing full descriptions of each lazaret and detailed proposals for their thorough reorganisation.¹ The mission to Mesopotamia was the last of the series.

In 1911 a number of proposals tending to remove the financial deadlock just referred to were made by the author to the Mixed Commission, as representing the power whose shipping contributed a larger proportion than any other of the ordinary income of the Board of Health. With some modifications those proposals were adopted in their entirety. The nature of the decisions thus taken need not be described in detail here, it will suffice to state that they included, on the one hand, a reduction of 20 per cent in the sanitary dues on shipping in Turkish ports and, on the other the spending of a sum of £T 280,000 (£252,000 sterling) out of the Board's reserve on the reorganisation of the Turkish lazarets. An adequate portion of this sum would have been allotted to the repair of the Basra and Khanikin lazarets and the carrying out of the other proposals put forward by the Commission of Inspection for the Improvement of the Sanitary Defences of Mesopotamia and the Turco-Persian Frontier. The outbreak of the war has, of course, completely suspended the execution of those proposals, and it may yet fall to some more efficient Power than Turkey to provide the means of protecting these regions from invasion by epidemic diseases.

II.—THE LAZARET OF BASRA.

The small group of dilapidated buildings, partly of sun burnt brick and partly of sticks and matting, which constitutes the Basra lazaret occupies the northern end of the island of Salihieh, near the left shore of the Shatt-ul Arab river. The town of Basra itself lies on the western side, some three kilometres from the river bank. On this side, however, the suburb of Ashar, a townlet of considerable size, has grown up and it is here that are situated the custom house, the foreign consulates, the offices of the principal

shipping companies, and other business buildings. Basra town and the Ashar suburb are connected by a creek canal, the Ashar Creek, which opens into the river, and by a rough and primitive road.

The lazaret of Basra, if properly reorganised should form an important element in the network of sanitary defences of the Persian Gulf. Those defences were discussed at considerable length in successive International Conferences notably those of 1894 (Dresden), 1897 (Venice), 1903 (Paris), and 1911-12 (Paris). The Dresden Convention of 1894 provided for the creation of a large lazaret at Faô, at the mouth of the Shatt-ul Arab river, and of a series of other stations, at Basra and in the ports of both sides of the Persian Gulf. Great Britain, however, rejected the section of the Convention containing these proposals. The Venice Convention proposed only a lazaret at Basra, and a "sentinel" station to be constructed on some island near the entrance of the Gulf, Hormuz or Kishm being suggested as suitable sites. This proposal was repeated in the Paris Convention of 1903, but was accepted by certain countries only under conditions which practically nullified the proposal. In the last Convention that of Paris, 1911-12, all these proposals were tacitly dropped, and it was left to the sanitary authorities of the different ports on and near the Gulf to apply, with slight modifications, the measures generally applicable under the Convention in all ports (Art. 83).

Meanwhile, and for many years before the last Convention was signed, a number of sanitary stations had been established in the ports of the Gulf and have been efficiently administered by British Indian officials. The existence of these stations had, indeed, rendered wholly unnecessary any special clauses in the Conventions for the sanitary defences of the Persian Gulf. Their establishment had not, however, been effected without difficulty and opposition, and German and Austrian influence had frequently been brought to bear with a view to altering their status and bringing them under some form of international control, but fortunately without success.

The Geographical Position of Basra

The Shatt-ul Arab is the river formed by the junction of the Tigris and Euphrates. At the angle of junction, some 40 miles (64 kilometres) north of Basra lies the village of Gournah, the traditional site of the Garden of Eden. For the curious in these matters it may be mentioned that a tree purporting to be that which played so fatal a part in the fall of man is still pointed out to the traveller. It is an ordinary acacia tree, and apparently of no great age.

Some 22 miles (35 kilometres) south of Basra (or Ashar) lies the Persian town of Mohammerah, situated at the point where the Karun river flows into the Shatt-ul Arab on its left side. The Sheikh of Mohammerah, while nominally under Persian suzerainty is to a very considerable extent an independent ruler. The small port of Faô, on the west side of the Shatt-ul Arab close to its mouth is distant 62 miles (100 kilometres) from Ashar. The total distance from Ashar to the "bar" or sandbank across the mouth of the river is 64 miles (134 kilometres). This bar is a local feature of considerable importance. It can only be crossed at low water by ships of light draft. Ships of deeper draught are compelled either to wait—sometimes for several days or even one or two weeks—until a favourable combination of wind and tide deepens the water sufficiently, or to discharge their cargoes into lighters which are then towed up the river to Basra. The delays thus caused to shipping will be readily understood.

Both sides of the river are very largely covered with extensive date plantations, and the cultivation, gathering and packing of the dates constitute the principal business of the inhabitants of these regions. At the time of the date harvest large numbers of persons are collected along the shores of the river temporarily housed in "scrifchs," or matting huts under highly insanitary conditions.

Innumerable creeks, some wide, some narrow open into the river on both sides, and most of these bear names. Along the left shore, for the whole distance between Basra and Mohammerah a series of long narrow islands have been formed, which are separated from the mainland by strips of water of varying width, and it is on one of these that the

¹ The work of some of these Commissions was described by me in articles published in THE LANCET in 1906 and 1909.

² Though the present tense is used here and throughout these articles it should be understood that all the statements they contain refer to the conditions found before the war in the winter of 1913-14.

³ For the sake of convenience the river is regarded as running from north to south though as a matter of fact its general course is from north-west to south-east, and in many parts, and notably near Basra, its course is rather from west to east than from north to south.

lazaret is built. It is not surprising, in view of these conditions, that malaria is widely prevalent along the valley of the Shatt-ul-Arab.

The water in the river and its tributary creeks falls to its lowest level in the months of August to October. In November, when the rains begin, there is a slight rise, but the real and serious rise only begins in the month of March, when the snows in the hills of Kurdistan and Persia begin to melt. From March to July the river is at its highest. The tidal rise and fall varies between 6 and 9 feet, according to the season of the year. In very dry seasons and at very low tides the creeks and strips of water between the islands and the main land may in some places become almost dry. The importance of these local conditions in connexion with the military operations now taking place in these regions will be readily understood.

Shipping in the Port of Basra

In ordinary times the British India Company sent every week from Bombay to Basra two steamers known respectively as the "fast mail" and the "slow mail." The former touched at few ports and did the journey in seven days, the latter called at many ports and took 15 days to complete the voyage. Several other British companies also served the Gulf and Basra more or less regularly. A large Russian steamer left Odessa for Basra every two or three months, and in the last few years the German Hamburg Amerika Company has sent a steamer to Basra about once a month.

The movement of shipping in the port of Basra has increased steadily of recent years and with the completion of the Bagdad and other railways and the development of irrigation schemes in Mesopotamia the importance of Basra as a shipping centre would inevitably have increased still further.

Full tables (omitted here) of the numbers and nationality of the ships visiting Basra in the ten years 1903-13 showed that the overwhelming proportion—over 90 per cent.—of steamers

FIG 1

Shiah Pilgrims on a Tigris steam boat.

were under the British flag, the yearly average of British ships being 167.4 out of a total average of 185.3 of all nationalities. The tables also showed that German ships were first seen at Basra in the year 1906-07, when eight German ships arrived there, this figure has since risen to 13 or 14 each year. Of the total amount paid in Basra in sanitary dues during the years in question British shipping contributed 82.6 per cent.

The Town of Basra

The population of Basra is reckoned at some 50,000 to 60,000. Like all other towns in these regions its sanitary conditions leave much to be desired. Many of the houses are built of sun burnt or kiln burnt bricks, but many others are "kutcha" constructions, in bad state of repair and much overcrowded. The water supply is mainly from the Ashar or other creeks—which receive every kind of surface pollution—or from wells. There is no system of drainage and cesspools exist in most of the houses. The town is unpaved and the streets are deep in an offensive mud after heavy rains.

The Basra Lazaret and the Question of its Transfer Elsewhere

It would serve no useful purpose to describe here in detail the actual lazaret of Basra as it existed two years ago. Briefly, it was found to be not only in a shocking state of disrepair but also so entirely inadequate in size and so lacking in everything that an institution of this kind should be that no course was open to the Commission but to propose its demolition and the construction in its place of a larger and properly planned and equipped sanitary station.

A question of primary importance submitted to the Commission was that of the transfer of the lazaret to another site. Turkey had frequently proposed, in successive international conferences its removal to Faô, at the mouth of the river, alleging that the present site was too near for safety to the town.

FIG 2

Pilgrims in the Lazaret of Basra

of Basra This proposal was successfully combated by the representatives of other Powers, the principal and conclusive objections to Faß being that, firstly, only one bank of the river here is Turkish and, secondly, that it is too far from the port of Basra, and that navigation would be seriously handicapped in consequence.

Many other sites had been suggested and their advantages and disadvantages were carefully examined by the Commission. Only one need, however, be named here. This was the Island of Shemshumieh, the third out of the four long narrow islands which lie parallel with the left shore of the river between Basra and Mohammerah, and which were referred to above. Its supposed advantages had been strenuously advocated but the Commission found the island quite unsuited as the site of a lazaret, for reasons which it would take too much space to develop here. It may be mentioned, however, that the actual line of the frontier between Turkey and Persia, as delimited in the winter of 1913-14, descends to the river some distance to the north (or north west) of Shemshumieh, so that here, as at Faß, only one bank of the river is Turkish. Moreover the island is the property of the Sheikh of Mohammerah, and this would render its expropriation by Turkey practically an impossibility.

While the principal objection put forward against the present site of the lazaret had been that its proximity to Ashar and Basra was a source of danger to those towns, the real reasons for proposing its transfer were probably of another character altogether, having little to do with public health considerations. The Commission came to the conclusion that the actual distance of the present site from Ashar, and *a fortiori* from Basra town, was ample to safeguard the latter from any danger of spread of disease from the lazaret. The river here has a width of 457 metres, or 1500 feet, the distance of the lazaret from the mouth of the Ashar creek—which is itself 3 kilometres from the town of Basra—is 2 kilometres, or 1½ miles, and the lazaret is down stream from the suburb of Ashar. The Commission therefore proposed to reconstruct the lazaret on the existing site and on a plot of land adjoining. Steps were being taken to arrange for the expropriation of this land for the public weal, under the Turkish law of expropriation, when the owner suddenly died and the land became the property of his heirs. All further steps were put a stop to by the outbreak of the war.

The Future Lazaret of Basra and the Measures to be Applied There

Whatever may be the future political status of these regions, some form of sanitary station will always be necessary in the neighbourhood of Basra, and the site just briefly described is as favourable as any that can be found. The measures prescribed in the International Sanitary Convention of 1911-12 should be applied here, as in any other port. A much to be desired uniformity will thus be introduced. Under former conditions the measures applied at Basra to ships coming from Indian or other Eastern ports were on each occasion imposed by special decision of the Constantinople Board of Health, and were constantly varying. Thus of recent years, while ordinary ships—that is to say, not pilgrim ships—were usually not subjected to very onerous measures pilgrim ships suffered from vexatious and usually unnecessary quarantines, and only by bringing persistent pressure to bear has it been possible to obtain a gradual relaxation in their severity. After the appearance of plague in India in 1896, ships with Shiah pilgrims on board from Indian ports were absolutely prohibited access to Basra and were repulsed if they attempted to come. By a decision, however, taken in March 1901, they were allowed to bring up to five pilgrims per 100 tons net register, but even then they were subjected to 10 full days' quarantine in the lazaret. In 1912 the proportion of Shiah pilgrims permitted was raised to 10 per cent and this could be increased to 20 per cent if the ship had on board a doctor, a disinfecting store, and a pharmacy, and the only measures imposed were a quarantine of the number of days needed to complete five days from the last infected port, disinfection, and application of the rat-destruction circular. Ships with a larger percentage of pilgrims than those mentioned were however still to be repulsed, and several troublesome incidents arose in consequence. All such troubles will cease with the application of the clauses of the International Convention. To apply those clauses some form of lazaret

will, as just stated, be necessary, and the Commission report contained very detailed proposals accompanied by plans and estimates prepared by a local architect, for such an establishment. The estimated cost of the new lazaret was £T 21 000 (about £19,000 sterling) and this sum would have been taken from the £T 280,000, which as already explained, had been voted for the repair of all the Turkish lazarets.

It would serve little purpose, even if space permitted, to describe here the proposals for the new lazaret, but mention may be made of two points—the water supply and latrine arrangements—since they are of general interest and throw some light on the local conditions.

The water supply is, and must continue to be, obtained from the river Shatt-ul Arab. This water is universally drunk by the inhabitants of the district, either in an unfiltered state or after filtration through porous earthenware vessels known as "hubs." The water, however, contains a large amount of suspended matter, mainly mineral, but comprising much organic matter also, and is often semi-transparent or quite opaque. Some form of purification will therefore always be necessary before distributing such water to persons interned in a sanitary station. This will become doubly necessary when cholera is present in Basra or its neighbourhood. It has been stated above that a properly administered lazaret here should offer no danger to its surroundings, but the past history of cholera at Basra has shown that the reverse is not equally true, and that when cholera is epidemic in and near the town the river water may become seriously contaminated with the cholera virus and prove a very real danger to persons in the lazaret. The following is a brief summary of three disastrous incidents, in which persons in good health undergoing quarantine in this lazaret were infected in this manner with fatal results.

The *s.s. Kapurthala* arrived from India at Basra on May 27th 1904. There were 147 passengers on board all in good health. During their stay in the lazaret 27 contracted cholera, and no less than 18 died.

The *s.s. Kola* arrived at Basra on Oct. 27th, 1910. There were 244 passengers on board all well, 24 of these contracted cholera in the lazaret and all, without exception, died.

The *s.s. Drarkala* reached Basra on Oct. 4th, 1910 with 99 passengers, all healthy. Nine of these contracted cholera in the lazaret, and eight died.

In each of these instances the infection was traceable to the drinking of unboiled water from the river at a time when cholera was epidemic in a severe form in the neighbourhood. There were other incidents of the kind, but in these three alone some 60 persons, who were interned in a deplorably bad lazaret, with the sole object of preventing a possible introduction of disease by them to Basra, were actually infected themselves by disease from that town, and 50 of them died. Since 1911 the water had been boiled before distribution to persons in quarantine and no such lamentable incident as those just described has occurred since.

In future arrangements for boiling the water will always be necessary when cholera is present at or near to Basra. In ordinary times it will perhaps be sufficient to filter it well. The Commission proposed to take the water, not direct from the river but from a well or wells thus allowing a first filtration by the soil, it would then have been pumped into a large settling tank, at ground level and thence to two smaller tanks placed on the top of a "water tower." Finally it would have been passed through a magnetic iron or other form of filter before being distributed to the various parts of the lazaret.

For the disposal of excreta it was proposed to have in each "cordon" a group of latrines on the trough system whence the excreta would have passed to a series of septic tanks. The effluent from these would have been admitted to the river only when the tide began to ebb and the current to be a descending instead of an ascending one. It may be noted that at this point on the river the water has an ascending current during three or four hours only and a descending current (i.e., towards the Gulf) during eight or nine hours. Should a few germs escape from the tanks into the river in spite of all precautions it was thought that they would offer little danger since they would enter the river on its left bank, far from Ashar and well below it, and they would once be diluted by the large volume of water in the river at or just after high tide. Moreover even in the past when the arrangements for excreta disposal were of the most

primitive and inadequate character, no instance could be traced in which disease had been spread by this means from the lazaret to the inhabitants of Basra or its surroundings. As a further precaution it would be desirable to take special measures for the disinfection and separate disposal of the excreta of persons actually suffering from cholera.

Basra as a Channel of Importation of Cholera and Plague

Both diseases have not infrequently been imported to Basra, and thence spread up the valleys of the Tigris and Euphrates as also that of the Karun, and caused epidemics in Mesopotamia Turkish Kurdistan, and Persia. But as a rule these epidemics have shown no great tendency to spread thence to other countries and this route has proved a far less dangerous one for Europe than that by the Red Sea and certain overland routes from the East. The history of each disease may be briefly considered separately.

In the first pandemic of cholera the disease was imported from ports on the Persian Gulf to Basra, and spread thence up the Tigris and Euphrates. The great pandemic of 1828-32 did not follow this route. In 1845-46 cholera was epidemic in Persia and in the latter year spread southwards through Mesopotamia from Bagdad to Basra. In 1851 the disease spread in the opposite direction from Basra to Bagdad, it reached Persia in 1852 and was practically endemic in that country until the year 1861. In 1865 cholera was imported to Mesopotamia by two different streams of pilgrims returning from Mecca—the one by the Aleppo and Euphrates route and the other by sea to Basra. From 1866 to 1870 cholera was widely prevalent in many countries including both Persia and Mesopotamia. In the next great pandemic that of 1881-87 these countries seemed to have escaped, but in 1889 the disease was again imported to Basra and spread up the Tigris and Euphrates and later to Persia. In the very severe pandemic of 1892 and subsequent years these regions suffered but little, but in May 1893 the infection appeared at Amara on the Tigris and shortly after spread to Basra, Kut-el-Amara and Bagdad. In 1899 it was freshly imported to Bushire and Basra and caused a high mortality among the date gatherers on the shores of the Shatt-ul Arab. In the next great pandemic, that of 1903 and following years, cholera came to Mesopotamia (in 1903) not by sea but by land from Syria spreading down the Euphrates valley and causing severe epidemics at Kerbela, Nejef and other places. It remained here and in Turkish Armenia until 1905. In 1904 it was epidemic in Mohammerah and spread into Persia by the Karun valley. It again appeared in the Tigris valley in 1910, apparently coming from Persia and spreading southward from Bagdad to Basra. In 1911 it followed a similar course and also spread up the Karun valley.

It will be seen from the above short summary that cholera has been imported to Basra nearly as frequently by land (or river) from the north as by sea. But the fact that it has been repeatedly imported by sea and the constant communication between Basra and Indian ports show that there will always be a real need of serious sanitary defences at this port.

Plague was for many centuries more or less prevalent in these regions and during the latter half of the nineteenth century the disease lingered in an endemo-epidemic form in certain places in the Euphrates valley and on both sides of the Turco-Persian frontier. From none of these centres however did the disease show any tendency to spread to more distant countries.

After the revival of plague in China and its spread to India at the end of the last century the disease was first imported to Basra in 1899 and a few cases occurred in the town again in 1900 and 1901. In May 1901 it broke out in Bagdad but the source of the infection could not be traced. In 1905 1907 1909 and 1911 serious plague epidemics occurred in the Bahrein Islands off the southern shores of the Gulf and spread to some other Gulf ports. In 1907 a few cases occurred in Basra, in 1908 and 1909 the disease was epidemic in Bagdad and in 1910 and 1911 it was present to some extent in Basra. In 1912 cases of the disease were imported to the Basra lazaret by at least five steamers coming from Bombay or infected Gulf ports but in none of these instances did the disease spread to the town. In 1913 and 1914 a few cases of plague were seen in Basra, and in 1915 the disease was present in Bender Abbas and Bushire on the Persian Gulf and spread to Mohammerah and Basra and later caused a severe epidemic in Bagdad and Kizimein.

(To be continued.)

PARAFFINUM LIQUIDUM THE B P STANDARD IGNORED

WE return to the question of the purity of paraffinum liquidum for medicinal purposes. When British refined paraffinum liquidum had been on the market for a period of about five months, replacing the German refined article, we called attention to the fact in two special articles in THE LANCET of Oct 2nd and 16th, 1915 pointing out that not only was there great and undesirable diversity in the retail price of medicinal oils offered, but that there was still on sale "Paraffinum Liquidum" of distinctly poor quality, and not conforming in many particulars with the Pharmacopoeia standard. We suggested also that it was necessary that a standard of viscosity should be established rather than the original one of specific gravity (0.860 to 0.890). The reason for urging the introduction of what appeared to be a new constant (viz., that of viscosity) was that a large amount of very "thin" oil had been imported, and it was shown that this material was not an effective or safe lubricant for the human digestive tract. We ultimately suggested as a result of investigating a considerable number of oils, that for medicinal purposes a minimum viscosity of 105 seconds at 100° F (measured on Sir Boverton Redwood's standard viscometer) should be insisted upon. Before the end of October it was very difficult to purchase any of these fluorescent, "thin," ill refined oils from any pharmacist, and since that date almost every test-purchase we have obtained proved to be highly refined and satisfactory liquid paraffin.

Recently, however, we learn that there have appeared in the United States a number of oils of American origin which, while they are without fluorescence, odour, or taste, do not conform to the British Pharmacopoeia's demands. In most cases the specific gravity is too low, being under 0.860. In many cases, when heated with an equal volume of "sulphuric acid in a test-tube placed in boiling water for ten minutes" (B.P. quotation) they impart an intense blackness to the acid. Few of them however, show the presence of sulphur by the ordinary Pharmacopoeia test. Almost all the American oils that we have examined have a very low viscosity, as will be seen from the following examples—

	Specific gravity	Viscosity at 100° F	Acid test
1	0.850	81 secs	Poor
2	0.854	74 "	Poor
3	0.853	73 1/2 "	Bad
4	0.859	100 "	Good
5	0.857	85 "	Bad
6	0.853	76 "	Poor

Not one of these six oils is really suitable for use in lubricating the delicate mucous membrane of the alimentary canal. They are all below the wide limits of the Pharmacopoeia in the matter of specific gravity (0.860 to 0.890), five are not equal to the prescribed acid test and all are too "thin"—too deficient in lubricating properties at body temperature. But that American refiners are quite capable of producing and do produce, a satisfactory medicinal oil and one equal to refined Russian oil is obvious from the results below of the examination of an American sample—

Specific gravity at 60° F	0.890
Viscosity at 100° F	235 secs
Acid test	Excellent
Sulphur	Absent

This sample was without taste, smell, colour, or "bloom" (fluorescence). It is evident, therefore, that American refiners can produce a good medicinal oil, though for the sake of commercial advantages inferior and possibly harmful products are freely found on the market.

We have evidence to show that there have recently appeared in various parts of England oils from American sources which have been distilled from unsuitable crude material and are not refined to the extent that is desirable for medicinal purposes. We know that samples of so-called medicinal oils have been purchased in provincial towns and also in London, at a retail price equal to that asked elsewhere for the purest oil, and these oils prove to be "thinner" than any given in the above American list. They run like water—not like oil. Their

specific gravity at 60° F is 0.850, and their viscosity averages 62.5 seconds—i.e., very little more than half of what should be the minimum. The response of these fluids to the acid test is better than that of many American oils but is capable of improvement. They are so very "thin" that they cannot possibly act as lubricants at body temperature, and are useless if not actually harmful for the purpose. Like the famous French writer "we take what is good for us where we find it", and, of course, we welcome American oils so long as they conform to the British Pharmacopœia, 1914. If they be sufficiently viscid, if both physically and chemically they answer all the requirements of the British Pharmacopœia, the introduction of such oils is an enterprise valuable to medicine. But if the American refiner is going to keep his good medicinal oil and send us bad material, and if the British market is to be inundated with imperfectly refined or unsuitable oils, medical men and pharmacists should be placed on their guard.

It is clearly laid down in the Pharmacopœia that liquid paraffin to be acceptable must have certain definite characteristics. It must be a perfectly pure inert lubricant if it is to fulfil the physician's ideas, and we cannot too strongly insist that anything and everything sold in this country under the name of liquid paraffin, or any of its synonyms, should conform in every respect to standard. In our opinion, two capital letters on every bottle (B.P.) should be demanded by the purchaser, and we suggest that the attention of our public authorities should be drawn to this matter before this admittedly useful method of treatment becomes discredited, as the result of refiners ignoring the standard laid down by the British Pharmacopœia 1914.

MEDICINE AND THE LAW

Attendance upon the Patients of a Colleague the Ethical Portion

In a trial at the recent assizes at Leeds a medical practitioner, Dr E. Heskin, was found guilty of the manslaughter of a female patient through negligence. A question arose during the trial as to whether a medical man on the staff of the infirmary who was asked to attend the deceased in the absence of the prisoner and who had not done so, ought to have gone to the woman's assistance. Some observations made by Mr Justice Shearman in summing up to the jury have been interpreted as a censure upon the medical practitioner in question or upon a rule of the infirmary which precluded him from attending the case. The following summary of the learned judge's observations has reached us, which hardly bears out the suggestion that he found serious fault with anyone in this connexion—

Whatever might be said about the rule there could be no doubt that Dr Holt was sincerely anxious to do his duty. An attempt was made to get some women doctors but they did not seem to understand the seriousness of the case. There was a rule of etiquette that one doctor should not attend the patients of another but it was well understood that that rule did not cover cases of urgent necessity. No doctor would allow a man to bleed to death in the street because he was some other doctor's patient.

It is quite clear, however, that each case must be governed by its particular circumstances. Every hospital must consider the duty to safeguard the interests of the patients within its walls, and equally so every medical man has obligations towards his own patients which may preclude him from hurrying to the assistance of a stranger, as to the urgency of whose need for aid he may not be satisfied. This is distinct from the question as to whether he should attend a patient who, he has reason to believe, is already under the care of another practitioner. In the case at Leeds Dr Holt, who was referred to in the judge's summing up, had been in communication with the prisoner on the telephone, and had been told by him that the case was in his hands and was not one of an urgent character. Certainly in such circumstances no medical man, whether in private practice or not, could be blamed if he decided not to attend, even though a relative of the patient asked him to do so.

A Profitable Slum Dwelling

At Bradford city police court recently a woman was fined £2 for permitting the occupation of premises not provided with proper sanitary and domestic accommodation. In the house there was one water closet in the basement, an insanitary sink in the underground kitchen, and a wash

basin in another room. There were rickety partitions, a leaky roof, dampness, and an absence of any place for cooking or for storing food or anything else. The profits made were well shown by the evidence. The rent paid by the defendant for the whole house was 9s. weekly, and the premises included a shop, as to which no charge was made. The shop was sublet by the defendant at 4s. 6d. per week. A kitchen five feet below the yard was sublet with another room on the ground floor for 7s. Gas was included in this payment, but it will be seen that the landlady's rent was amply covered even if she did not let any more of the house. Three persons, however, occupied another room on the ground floor at 6s. 6d. Two more lived on the first floor, paying 2s. 6d. each and two young women who shared the leaky attics paid 2s. 11d. each. A gross profit of 19s. 10d. was therefore realised. It is to be hoped that the Bradford corporation, who prosecuted under an Act of Parliament obtained by it in 1913, will not be deterred by the light penalty inflicted from dealing firmly with such people as this defendant.

New and "Separated" Milk Blended

O. Wheeler, a dairyman at Shepherd's Bush, was fined £40 in the winter for selling milk found to be 10 per cent. deficient in fat. At the Acton police court he denied on oath having bought "separated" milk from a farm in Somerset during the past 12 months, the suggestion being that milk from which the cream had been extracted was mixed by him with new milk. At the recent sessions at the Central Criminal Court Wheeler was tried for perjury, evidence being given that two churns of separated milk had been sent to him daily from Somerset in accordance with a contract, up to the time when he was summoned, and that only after leaving the police court he had telegraphed ordering its discontinuance and asking for new milk to be sent on the following day in its place. He was found guilty by the jury, but sentence was postponed pending the decision of a point of law raised by his counsel that the evidence in giving which the defendant was alleged to have committed perjury was not material to the issue before the court.

Public Health.

REPORTS OF SCHOOL MEDICAL OFFICERS FOR 1915

At Huddersfield there were 4215 children inspected according to the routine examination. The state of nutrition was found to be "normal" in 97.32 per cent., and "excellent" in 1.87 per cent., there being only 0.81 per cent. below normal, and no instances of actually "bad" nutrition. So high a proportion of well nourished children is very satisfactory, and it is in strong contrast with the 35.7 per cent. of Liverpool school children found to be more or less defective in this respect. The standard of eyesight was also very satisfactory 88.4 per cent. of those examined having normal vision in each eye. Dr S. G. Moore states that the standard of cleanliness of former years has not been maintained, and cannot be regarded as altogether satisfactory. He considers the condition to be one of great importance in regard to health. The verminous condition has an injurious effect on the children in many ways: it disturbs sleep, inhibits power of concentration, leads to formation of sores and frequently to septic infection and malnutrition. Of 10,366 children examined as to cleanliness by the school nurses a verminous condition was found in 699 that is 6.74 per cent., as compared with 3.23 per cent. in 1914. At the routine medical inspections, however, only 0.12 per cent. of pediculosis was found (presumably because the children were got ready for the occasion). Organic disease of the heart was found to exist in 5 out of 2147 boys and in 1 out of 2068 girls. Tuberculosis was diagnosed in 71 out of 2147 boys and in 45 out of 2068 girls being glandular (not pulmonary) in all cases but two in 9 other cases (pulmonary) it was suspected.

At Hull Dr James W. Fraser reports that the sleepless nights caused by alarms of possible air raids produced such an effect on the attendance of children at school on the day after the alarm and on the mental capacity of those who did attend that the education committee resolved to close the schools on days when official

ification of a possible raid had been made. There were no such closures. It has now been resolved to close only in the morning session in case of alarm. As Sir Lucius Trigger once observed, there is nothing like being used to things. The total number of children inspected was 14,341. Their nutrition was "normal" in 75.39 per cent., and "excellent" in 8.33 per cent., leaving 14.04 per cent. of "below normal," and 0.42 per cent. of "bad." Perfect vision in each eye was possessed by 39.73 per cent., and in either 11.93 per cent. had perfect vision in one eye. Cases of diphtheria were notified in practically every school during the year, there being an increase during the autumn. At Clifton-street school bacteriological investigation showed such a large number of positive findings that the infants' department, and subsequently the two senior departments, were closed for periods rather over a fortnight. Swabbings ill proved to be unsatisfactory and all departments were again closed until after the Christmas holidays. At Clifton-street school 56.9 per cent. were found to give either Klebs-Löffler or Hoffmann reactions. "It was decided to treat the Hoffmann cases as positive, and the wisdom of this step was shown by the fact that many of the cases which showed the Hoffmann bacilli at the first examination, showed the Klebs-Löffler bacilli at the second." In an interesting appendix on the prevalence and effects of tonsillitis it is shown that their incidence amounted to 5.05 per cent. in boys and to 6.73 per cent. in girls, or 5.79 per cent. for the whole number of children, this is about double the rate of the general incidence (3 per cent.) on the school population throughout the country. It appears that the infection is more common in the eastern than in the milder western districts of Great Britain.

At Liverpool 35,360 children were examined at the specified age-periods, their nutrition was found to be "normal" in 39.1 per cent., and excellent in 10.38 per cent., leaving 35.7 per cent. as below normal or bad. The standard of vision as satisfactory 39.46 of those examined having perfect vision in each eye and 28.20 per cent. having not less than 6/9 in one or both eyes. Classes for children with defective vision have been held at one of the schools with good results, some children having improved so much as to be able to return to their ordinary school and others having left to go to work. Organic disease of the heart was diagnosed in 127 boys and 156 girls, the ratio of incidence being 0.80 per cent. for the whole number examined. Tuberculosis of the lungs was found in 0.03 per cent. and suspected in a further 0.05 per cent. of the children examined. Non-pulmonary tuberculosis was diagnosed in 0.08 per cent. Considerable disorganisation both of the medical and of the clerical staff occurred owing to the war but the requirements of the Board of Education were met. Two minor ailment centres or clinics, have been established at which more than 1100 children were treated for affections of the skin (mainly impetigo) eyes and ears. Very great benefit has resulted from this course of action especially at Garston, where local facilities for the treatment of the poorer classes were practically non-existent. Dr E. W. Hope considers that an extension of these clinics is desirable.

The report of Dr Ernest T. Roberts on the medical inspection of children in *Gloucester* relates to the period from July 1st, 1914 to July 31st 1915. The total number examined was 24,611, and 31.3 per cent. were found to be suffering from some disease or defect requiring treatment. Defective dental conditions existed in 22.23 per cent., five decayed teeth being taken as the amount of defect needing attention. Organic disease of the heart was diagnosed in 2 boys and 64 girls being in a ratio of 0.46 per cent. for the whole number examined. Tuberculosis of the lungs was found in 27 children and tuberculosis other than pulmonary in only 18, the incidence on the whole number amounting to 0.162 per cent. A satisfactory item in the report is the statement that no schools were closed during the year on account of infectious disease.

The report on school medical inspection at *Bilston* in 1915 refers to a total number of 1595 children examined according to routine as entrants, intermediates or leavers. Their state of nutrition was found to be very satisfactory at each age-period having been either normal or above the normal in all but 9 per cent. of the entrants, 7 per cent. at the intermediate age and 5.7 per cent. of the leavers. In regard to teeth, of the entrants 16.6 per cent. had four or more decayed, of the leavers only 6.9 per cent. As to the

condition of vision, out of 1005 children of intermediate age and leavers, 21 per cent. (of the eyes examined separately) had less than 6/9 visual acuity. Organic disease of the heart was diagnosed in 4 out of 608 leavers and in 2 out of 590 entrants. The children were particularly free from tuberculosis, only 7 cases of this disease affecting the lungs (0.42 per cent.) being found and no cases at all of tuberculosis in other organs. Dr T. Ridley Bailey's report is very clear and concise.

The report on medical inspection at *Chesterfield* for 1915 is a brief one, as the work had to be curtailed owing to the war. Routine inspection was only carried out in the early months of the year, and from May onwards the sole work done was that at the school clinics where inspections were held twice a week. Of the 635 children seen at the routine examinations, entrants, intermediates, and leavers 33 per cent. had defective teeth and 26 per cent. are stated to have had defective vision, but the amount of defect is not specified, and in the case of vision presumably the figures do not refer to the entrants. At the clinic 795 children were treated, most being cases of affection of the skin (impetigo ringworm) or sore throat, or eye disease. Reinspection is carried out with great thoroughness, a child with any defect being seen five times every year, nevertheless, only 21.3 per cent. of defective children have received treatment. As many as 12 or more notices drawing attention to defects have been sent to parents. In some cases a letter, drawing attention to Section 12 of the Children Act of 1908 has had an effect on the parent, in future, prosecutions will be undertaken for neglect. Dr R. Fraser notes the large number of children attending the clinics and excluded from school for long periods for persistent verminous conditions and scabies and recommends domiciliary visiting by the school nurse.

At *Guildford* the number of children submitted to routine examination was 982. There appears still to be some reluctance on the part of many parents to have their children examined, as 21 objections were formally made, and 25 children were kept at home on the days notified for inspection. This prejudice has now almost disappeared in most of the large centres of population, where parents have become aware of the benefits resulting from taking "a stitch in time." Of the 296 boys examined at the intermediate and leaving age-periods 51, and of the 253 girls the same number, suffered from some visual defect—that is 18.5 per cent., of the total number examined, the exact amount of defect regarded as needing treatment is not stated. Among the 538 boys 10 cases and among the 444 girls 5 cases of heart disease were detected. The tuberculosis cases were 7 among the boys, and only one among the girls.

VITAL STATISTICS

HEALTH OF ENGLISH TOWNS

In the 96 English and Welsh towns with populations exceeding 50,000 persons at the last Census, 7665 births and 3555 deaths were registered during the week ended Saturday, August 5th. The annual rate of mortality in these towns which had been 10.7, 11.1, and 10.4 in the three preceding weeks, rose in the week under notice to 10.8 per 1000 of their aggregate civil population estimated at 17,512,295 persons for the year 1915. During the first five weeks of the current quarter the mean annual death rate averaged 10.8, or the same as the corresponding rate in London. Among the several towns the death rate last week ranged from 4.2 in Warrington 4.4 in Eastbourne 4.6 in York, and 5.0 in Swindon, Smethwick, and Barrow in Furness, to 16.0 in Bootle 18.8 in Carlisle 19.7 in Tynemouth, 22.0 in St. Helens, and 22.1 in Walsall.

The 3555 deaths from all causes were 116 above the number in the previous week and included 225 which were referred to the principal epidemic diseases, against 222, 212, and 221 in the three preceding weeks. Of these 225 deaths, 82 resulted from infantile diarrhoeal diseases, 53 from measles, 40 from diphtheria, 25 from whooping-cough, 14 from enteric fever, and 14 from scarlet fever, but not one from small pox. The annual death rate from these diseases was equal to 0.7, against 0.7, 0.6, and 0.7 in the three preceding weeks. The deaths of infants (under 2 years) from diarrhoea and enteritis, which had been 51, 46, and 72 in the three preceding weeks further rose to 82 last week, and included 18 in London, 7 in Liverpool and 6 in Birmingham. The fatal cases of measles, which had been 62, 59 and 64 in the three preceding weeks, fell to 53 last week, and included

24 in London, 8 in Liverpool, and 3 each in West Ham, Birmingham, and Sheffield. The deaths from diphtheria, which had been 47, 43, and 35 in the three preceding weeks, rose to 40 last week, and included 16 in London, 6 in Stoke on Trent, and 3 in Liverpool. The deaths from whooping cough, which had been 40, 42, and 35 in the three preceding weeks, further fell to 25 last week, and included 5 in London and 3 in Liverpool. The fatal cases of scarlet fever, which had been 15, 17, and 9 in the three preceding weeks, rose to 14 last week, and included 2 in London. The deaths from enteric fever, which had been 7, 5, and 5 in the three preceding weeks, rose to 14 last week, and included 2 each in London, Plymouth, Manchester, and Bradford.

The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and in the London Fever Hospital, which had been 1236, 1216, and 1221 in the three preceding weeks, fell to 1173 on Saturday last, 121 new cases were admitted during the week, against 150, 172, and 171 in the three preceding weeks. These hospitals also contained on Saturday last 1253 cases of diphtheria, 189 of measles, 145 of whooping cough, 38 of enteric fever, but not one of small pox. The 936 deaths from all causes in London were 58 above the number in the previous week, and corresponded to an annual death rate of 11.3 per 1000. The deaths referred to diseases of the respiratory system, which had been 117, 99, and 90 in the three preceding weeks, rose to 99 in the week under notice.

Of the 3585 deaths from all causes in the 96 towns, 173 resulted from violence, 300 were the subject of coroners' inquests, and 1187 occurred in public institutions. The causes of 28, or 0.8 per cent., of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in West Ham, Bristol, Stoke on Trent, Leicester, Nottingham, Salford, Bradford, Leeds, Hull, Newcastle-on-Tyne, and in 70 other smaller towns. Of the 28 uncertified deaths, 7 occurred in Birmingham, 6 in Liverpool, and 2 in Blackpool.

HEALTH OF SCOTCH TOWNS

In the 16 largest Scotch towns with an aggregate population estimated at 2,372,000 persons at the middle of this year, 1063 births and 508 deaths were registered during the week ended Saturday, August 5th. The annual rate of mortality in these towns, which had been 12.6, 11.2, and 12.5 in the three preceding weeks, fell to 11.2 in the week under notice. During the first five weeks of the current quarter the annual death rate in these towns averaged 12.0, or 1.2 per 1000 more than that recorded in the large English towns. Among the several towns the death rate last week ranged from 6.9 in Coatbridge and in Clydebank, 8.6 in Perth, and 8.7 in Motherwell, to 14.7 in Hamilton, 16.8 in Greenock, and 17.1 in Ayr.

The 508 deaths from all causes were 58 below the number in the previous week, and included 35 which were referred to the principal epidemic diseases against 39 and 37 in the two preceding weeks. Of these 35 deaths, 15 resulted from infantile diarrhoeal diseases, 8 from measles, 5 from scarlet fever, 4 from diphtheria, 3 from whooping cough, and 1 from enteric fever, but not one from small pox. The annual death rate from these diseases was equal to 0.8, against 0.7 per 1000 in the large English towns. The deaths of infants (under 2 years) from diarrhoea and enteritis, which had been 8, 7, and 15 in the three preceding weeks, were again 15 last week, and included 6 in Glasgow, and 2 each in Dundee, Aberdeen, and Paisley. The fatal cases of measles which had been 18, 17, and 7 in the three preceding weeks, were 8 last week, and included 2 in Greenock. The deaths from scarlet fever, which had been 7, 3, and 5 in the three preceding weeks, were again 5 last week. The fatal cases of diphtheria, which had been 3, 6, and 6 in the three preceding weeks, fell to 4 last week, and included 2 in Kirkcaldy. The three deaths from whooping cough were recorded in Glasgow, Dundee, and Coatbridge, and the death from enteric fever in Greenock.

The deaths referred to diseases of the respiratory system, which had been 50, 62, and 40 in the three preceding weeks, rose to 58 last week but were 12 below the number registered in the corresponding week of last year. The deaths from violence numbered 33, against 22 and 32 in the two preceding weeks.

HEALTH OF IRISH TOWNS

In the registration area of Dublin 207 births and 107 deaths were registered during the week ended Saturday, August 5th. The annual rate of mortality which had been 18.8, 15.2, and 14.4 in the three preceding weeks, further fell to 14.1 per 1000 in the week under notice, against 11.3 and 11.0 per 1000 in London and Glasgow respectively.

Of the 107 deaths at all ages 12 related to infants under 1 year, and 30 to persons aged 65 years and upwards. Three deaths of infants (under 2 years) were referred to diarrhoeal

diseases, and 1 fatal case of enteric fever and 1 of measles were registered.

The causes of 4 deaths were uncertified, and 3 others were the subject of coroners' inquests, while 63 or 59 per cent. of the total deaths occurred in public institutions.

During the same period 152 births and 95 deaths were registered in the city of Belfast. The deaths corresponded to an annual rate of 12.7, or 0.3 per 1000 more than in the previous week, and included 20 of infants under 1 year of age, and 18 of persons aged 65 years and upwards. Three deaths were referred to measles, and 2 each to scarlet fever, diphtheria, and infantile diarrhoeal diseases. The causes of 9 deaths were the subject of coroners' inquests, and 23 deaths occurred in public institutions.

THE SERVICES

ROYAL NAVY MEDICAL SERVICE

Staff Surgeons to be Fleet Surgeons J. S. Dadding, A. H. Harris, L. Lindop, O. T. Baxter, W. E. Gribbell, R. W. D. Hall, H. V. Wells, W. Bastian, R. B. Scribner, A. I. Shelden, J. Whelan, and C. R. Rickard.

To be temporary Surgeons N. K. Henderson and W. D. Gabriel.

ARMY MEDICAL SERVICE

Colonel M. T. Yarr to be temporary Surgeon General while a D.M.S. (without the pay or allowances of that rank).

Lieutenant-Colonel H. H. Tooth, R.A.M.C. (T.F.) to be temporary Colonel.

ROYAL ARMY MEDICAL CORPS

L. S. Dudgeon (late temporary Lieutenant Colonel R.A.M.C.) to be temporary Lieutenant-Colonel.

Majors (temporary Lieutenant-Colonels) relinquish the rank of temporary Lieutenant-Colonel on re-posting: Sir Edward S. Worthington, A. F. Carlyn, and D. L. Hardinge.

Temporary Lieutenant-Colonel Sir J. R. A. Clark having ceased to be in charge of the St. John Ambulance Brigade Hospital, relinquishes his commission.

Temporary Honorary Major C. J. Trimble to be temporary Lieutenant-Colonel whilst in charge of the St. John Ambulance Brigade Hospital.

Captain (temporary Major) V. T. Carruthers relinquishes the rank of temporary Major on re-posting. Temporary Captain L. E. Owen to be temporary Major.

Temporary Honorary Captain T. Houston to be temporary Honorary Major whilst employed with the St. John Ambulance Brigade Hospital.

Lieutenant-Colonel Charles C. Heywood, from Manchester Regiment (T.F.), to be temporary Major.

Robert A. Fleming (Captain, R.A.M.C. T.F.) to be temporary Major whilst in charge of a Medical Division of a General Hospital.

Temporary Captains to be temporary Majors: J. W. Struthers, J. S. Morrow, and J. C. Woods (whilst serving at the Palace Green Hospital).

H. Wiltshire to be temporary Major.

Temporary Captain W. J. Maloney relinquishes his commission on account of ill health.

Temporary Captains relinquishing their commissions: C. M. Hoare and H. R. Bramwell.

Temporary Lieutenants to be temporary Captains: D. T. C. Frew, R. D. Davy, S. A. Hall, A. H. Tovey, A. F. Bell, J. McG. Johnson, F. T. Simpson, A. M. Fisher, F. McKee, C. O. Walsh, H. E. Moore, P. L. L. Craig, D. T. Skeen, C. H. Shearman, R. Fell, A. F. Cole, H. L. Dixon, T. Marlby, A. H. Walker, H. E. Humphrys, P. Daly, H. Quigley, W. H. Compton, J. P. Musson, W. R. Allen, T. J. H. Hoskin, A. Robb-Smith, R. W. Sutherland, R. Briffault, I. W. Corker, G. R. Gray, W. E. Stevenson, N. McC. Boyce, J. A. Mescal, A. Climble, D. Whyte, C. J. West, J. M. Whyte, A. Frew, J. F. W. Leech, C. F. Nicholas, H. W. Dyke, H. W. Hodgson, W. F. O. Regan, E. C. Cunningham, H. Dodge, H. Croft, S. W. Williams, G. R. B. Parze, A. W. Mitchell, J. K. Small, R. W. Statham, D. A. Birrell, F. H. Allfrey, W. Russell, W. H. McWalter, T. D. Moffatt, A. M. J. Halligan, C. S. Miller, F. C. Tibbs, D. Wilson, R. W. E. Roo, T. C. Ritchie, J. E. Power, A. Peden, A. F. Flower, E. D. F. Hayes, G. O. F. Alley, S. G. Vinter, J. C. Fisher, A. D. Hamilton, F. G. Ralston, D. Renton, L. S. Shoosmith, E. H. Paddison, R. Dow, J. M. Smeaton, T. S. Reeves, M. T. Morgan, A. W. Baker, P. V. Early, J. R. McVail, H. P. Hall, G. Buchanan, G. R. Plalster, C. L. Miller, A. Z. Phillips, H. L. H. Greer, A. J. W. Cunningham, A. Patrick, I. B. Martin, J. Patrick, D. Glen, R. Millar, R. D. Nasmyth, T. Campbell, W. R. Tat, G. B. Kennedy, F. R. Hassard, G. W. Anderson, P. Quenel, C. Verge, L. R. Meech, R. W. Young, A. T. Bond, G. A. Simmons, C. B. Davies, W. C. McV. Dicker, H. S. Smith, A. E. London, G. T. O'Donnell, A. D. Desmiers, W. F. Jones, C. Russell, A. C. Major, F. C. H. Piggott, G. M. Brown, W. B. Gourlay, S. P. Hodgkinson, C. J. Young, S. A. Huby.

F Slater, T H. Thomas, J E. Stewart, J R. Bryce, C F. Brady, G. Kennedy, H. W. Pigeon, D. Miller, H. Appleton, W. A. McIntyre, C. McK. Craig, J. McL. Gibson, G. P. Wilson, A. Chalmers, C. Mitchell, J. Simpson, J. T. Murphy, E. Underhill, F. J. P. Daly, S. Forrest, J. F. Dow, B. Malaher, P. J. Kelly, A. C. Keay, P. McDougall, F. W. Chamberlain, M. Krolik, T. L. Clark, W. N. Child, D. E. Morley, W. G. Scott, and F. N. Stewart.

To be temporary Captains: R. M. Beaton, C. T. Parsons, C. E. Murphy, R. T. Smith, and temporary Lieutenant W. Elwood.

Temporary honorary Lieutenants to be temporary Lieutenants: M. K. Robertson, F. C. Ormerod, P. E. D. Pank, G. P. B. Huddv, G. Moulson, and T. D. Morgan.

To be temporary Lieutenants: J. A. Aitken, T. Jones, J. Kirk, M. Lyons, E. G. D. Murray, A. H. Bloxsome, S. J. Brennan, R. D. Brennan, H. E. Scoones, D. K. Henderson, J. H. Wilson, W. Dickson, W. H. Robinson, A. H. Turner, Lieutenant R. D. Ferguson (Canadian A.M.C.), C. A. Holburn, E. P. Duncan, W. G. Souther, R. McLaren, P. K. McCowan, P. W. Dove, C. P. Charles, F. C. V. Thompson, R. C. Crawford, P. C. West, J. H. D. Webster, A. B. Coomber, C. T. I. Clarke, J. Sterry, A. H. Davies, H. A. Tullman, H. G. Browning, H. R. Marsh, J. M. Hammond, W. A. MacKay, J. Butler, W. R. Wile, D. Craig, H. Findlay, F. W. Falconer, Lieutenant P. S. MacLaren (Canadian A.M.C.), W. R. D. Daglish, J. M. Taylor, S. J. Haylock, J. L. O. Tiller, C. J. D. Bergin, R. M. Gordon, R. S. Park, G. B. Wild, A. F. W. Denning, A. W. George, A. G. Reid, R. H. Smythe, E. D. S. Heviger, C. C. Meccredy, W. P. MacKasey, N. Kennedy, C. J. R. Hoffmeister, E. H. Morris, E. E. T. Nuthall, H. W. Garden, and H. G. Kilner.

To be temporary Honorary Lieutenants: G. C. Hartler and D. O. Richards.

Temporary Lieutenants relinquishing their commissions: H. Lasnier, R. Ingram, F. Heatherley, J. Hunter, H. E. Brawn, E. W. Goble, D. E. Ferwick, J. S. E. Selby, C. Ede, H. J. Hoile, T. F. Wilson, J. Landman, H. W. Sinclair, P. McGibbon, D. W. Davis, W. S. Badger, R. D. Laurie, J. J. G. Pritchard, F. S. B. Fletcher, C. F. Fothergill, A. Shearer, H. D. Everington, R. M. MacLennan, L. P. Black, A. T. Moon, H. G. Wood Hill, A. M. Watts, F. W. Lyle, A. M. M. Roberts, A. T. Johns, O. R. P. Muller, D. S. Macbean, W. E. Peck, W. Lumsden, W. Browne, E. J. Chambers, C. V. Knight, J. Menzies, B. Blacklock, A. McEwan, M. B. Stuart, W. H. N. Bright, H. C. Meacock, E. Fullerton, J. E. Prentis (on account of ill health), W. W. Kennedy, R. Paul, T. J. Waddell, R. J. Gordon, D. A. McAulay, F. A. Keillor, H. H. Planché, L. G. Gunne, G. E. Richards, W. Dickson, J. S. McCallum, C. C. Hargreaves (on account of ill health), and G. R. Naylor.

Temporary Honorary Lieutenant E. Aylward relinquishes his commission on ceasing to be employed with No. 8 British Red Cross Hospital, and temporary Honorary Lieutenant W. E. N. Dunn on ceasing to be employed with the British Red Cross Hospital Netley.

To be temporary Honorary Lieutenants whilst serving with No. 8 British Red Cross Hospital: A. Banks and C. E. Sparks.

Temporary Honorary Majors from the Australian Voluntary Hospital, to be temporary Majors: R. Dick and S. W. Patterson.

Temporary Honorary Captains from the Australian Voluntary Hospital, to be temporary Captains: R. V. McDonnell and B. T. Edge.

Temporary Honorary Lieutenant Cecil Charles Coghlan from the Australian Voluntary Hospital, to be temporary Lieutenant.

INDIAN MEDICAL SERVICE

The King has approved relinquishment by the undermentioned of the temporary rank of Lieutenant: Sobha Ram Kapoor and Ardesbir Behramshah Pestonji.

SPECIAL RESERVE OF OFFICERS

Royal Army Medical Corps

Cadets from Glasgow University Officers Training Corps to be Lieutenants: T. Blackwood, J. P. Broom, A. C. Brown, J. W. Daiglish, J. F. Duthie, J. Ewing, E. G. S. Hall, R. W. MacDonald, D. B. McIntosh, J. W. Maclean, A. F. McMullan, R. Rodger, and (ex Cadet) J. A. Buchanan.

Cadets from Manchester University Officers Training Corps to be Lieutenants: Cade G. Lapage and Cade G. Lapage.

Cadets from Leeds University Officers Training Corps to be Lieutenants: Cyril Reginald Knowles.

Cadet, from Aberdeen University Officers Training Corps to be Lieutenant: G. J. Kev.

Cadets from University of London Officers Training Corps to be Lieutenants: J. M. H. Campbell, P. D. H. Chapman, and R. S. Aspinall.

Cadets from Birmingham University Officers Training Corps to be Lieutenants: E. B. Alabaster, D. F. Standing, and R. J. Slater.

Cadets from Cambridge University Officers Training Corps to be Lieutenants: W. F. Haultain and D. D. Evans.

To be Lieutenants: J. B. Steven, K. J. T. Wilson, R. Isbister, T. Gray, M. Dwyer, D. S. Scott, N. H. Harrison, W. H. Dye, A. H. Craig, and G. Ewen.

TERRITORIAL FORCE

Army Medical Service

Colonel D. J. MacKintosh from Assistant Director of Medical Services, Lowland Division, to be Colonel.

Royal Army Medical Corps

Eastern Mounted Brigade Field Ambulance: Major (temporary Lieutenant-Colonel) W. Archibald relinquishes his temporary rank on ceasing to command a Field Ambulance.

East Lancs Field Ambulance: Major W. L. Bentley to be temporary Lieutenant-Colonel whilst commanding a Field Ambulance. Lieutenant J. Bruce to be Captain.

West Lancs Field Ambulance: A. H. Pinder to be Lieutenant. Major H. Halton, from West Lancs Field Ambulance, to be Major. Captain G. B. Robinson, from a T.F. Field Ambulance to be Captain.

London (City of London) Field Ambulance: Captain J. M. A. Costello, from Attached to Units other than Medical Units, to be Captain.

North Midland Casualty Clearing Station: Major A. R. Henschler to be temporary Lieutenant-Colonel whilst commanding a Casualty Clearing Station. Captain A. Heath, from North Midland Field Ambulance, to be Captain. Lieutenant J. W. Archibald to be Captain.

2nd London Sanitary Company: Lieutenant C. H. Lally to be Captain.

South Midland Mounted Brigade Field Ambulance: A. E. Crabbe to be Lieutenant.

Southern General Hospital: Captain J. H. Dawe resigns his commission on account of ill health.

Eastern General Hospital: Major R. A. Milligan is seconded.

London Field Ambulance: A. C. Smith to be Lieutenant.

West Riding Field Ambulance: To be Lieutenants: L. A. Williams, M. B. G. Sunette, and H. Vallow.

Attached to Units other than Medical Units—Major W. A. Smith, East Lancs Regiment, to be Major (temporary). Captain G. S. Ward and J. Orton to be Majors. Lieutenant L. A. Wilson to be Captain. F. Gamm to be Lieutenant.

Obituary.

WILLIAM TAYLOR, M.D. EDIN., F.R.C.P. EDIN.

THERE passed away on July 31st at his residence in Edinburgh one of the oldest members of the medical profession in the city. A native of Forfarshire, he received his medical education at Edinburgh University where he graduated in 1867. He became assistant to the late Professor Laycock in the department of practice of medicine, and later demonstrated for Professor Spence, whose 'Systematic Surgery' he edited. When assisting with the practical teaching of surgery he was most popular with the students in his classes in minor surgery. He also assisted in the electric department of the Infirmary and did considerable obstetrical work which was of practical value in securing for him a large private practice. He was for a time resident surgeon at the Maternity Hospital, Edinburgh. He was a Fellow of the Royal College of Physicians and also a member of the Scottish Society of Arts.

Dr Taylor is survived by two sons and two daughters. One of his sons, Dr Macrae Taylor, is at present serving as major in the R.A.M.C., and one of his daughters is nursing abroad in connexion with the war. He will be much missed in Edinburgh by a large circle of friends.

THE LATE DR A. H. LISTER

Dr Matthew Hay has sent us an appreciation of Dr A. H. Lister in which he says: 'Arthur Lister quickly made many friends in Aberdeen, and had become so attached to the most northern of British Universities and cities that when he completed his medical course he had, in spite of strong professional inducements to return to the south, virtually decided to settle in practice in the city of his professional birth. He married almost immediately afterwards a daughter of Sir Reginald Palgrave, and it may be said that Aberdeen has never known more gracious and winning personalities than those of Arthur Lister and his cultured wife. His university reputation—he was *facile princeps* of the graduates of his year—his somewhat maturer age than that of the ordinary medical graduate—for he had been in

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Lieutenant B R Roberts, R A M C was educated at Queen's College, Galway, and qualified at Edinburgh in 1898. Prior to the war he was medical officer to the Central South African Railways.

Captain J L Green, R A M C, V C, attached to the Sherwood Foresters, previously reported "missing," and to whom the posthumous honour of the V C is reported in THE LANCET of to-day was educated at Cambridge and St Bartholomew's Hospital, London, qualified in 1913.

Captain J H Bellby, R A M C, attached to the Worcestershire Yeomanry, was educated at Edinburgh and Vienna, and qualified in 1889. Before joining the R A M C he was in practice at Bromsgrove, Worcestershire, and was surgeon to the local cottage hospital.

Died of Wounds

Captain R M Denny, Loyal North Lancashire Regiment who was a combatant officer, was educated at Winchester and St Bartholomew's Hospital, London, qualifying in 1909.

Lieutenant W G Shand, R A M C, attached to the Lancashire Fusiliers was educated at Glasgow University, qualifying in 1903. Before joining the R A M C he was in practice at Salford.

Captain O H Peters, R A M C, qualified M B Melbourne in 1902, and joined the R A M C soon after the outbreak of war.

Wounded

Captain W S Garden, R A M C, attached to the Northumberland Fusiliers.

Captain E H Griffin, R A M C attached to the Northumbrian Fusiliers.

Captain J P Walsh, C A M C, attached to the Canadian Infantry.

Captain H C Bruce, R A M C, attached to the Argyll and Sutherland Highlanders.

Lieutenant R S Gibson, R A M C, attached to the Royal Garrison Artillery.

Captain A C Hancock, R A M C.

Captain J R N Warburton, R A M C.

Captain J Ferguson, R A M C.

Captain C M Jones, R A M C, attached to the Royal Field Artillery.

Captain W A Taylor, R A M C.

Lieutenant W E H Beard, R A M C, attached to the Manchester Regiment.

Captain A. Hines, R A M C attached to the York and Lancaster Regiment.

Captain M Scott, R A M C attached to the Northamptonshire Regiment.

Captain J D Wilkinson, R A M C, attached to the Royal Field Artillery.

THE HONOURS LIST

The Victoria Cross

The King has conferred this coveted distinction upon the following member of our profession who unfortunately lost his life in carrying out his noble action —

Captain John Leslie Green, R A M C

For most conspicuous devotion to duty. Although himself wounded he went to the assistance of an officer who had been wounded and was hung upon the enemy's wire entanglements and successfully dragging him to a shell hole where he dressed his wounds and standing that bombs and rifle grenades were thrown at him the whole time. Captain Green then endeavoured to bring the wounded officer into safe cover and had nearly succeeded in doing so when he was himself killed.

... a few years before entering medicine, his unusual attractiveness of manner and extraordinary sympathy with human suffering, and his whole-hearted devotion to the well-being of his patients won for him almost instantly one of the best and most select medical *chientes* in the north. He was fortunate in being appointed early to an assistant physicianship in the Royal Infirmary almost immediately after beginning practice, and the infirmary staff had never a more assiduous and thoughtful worker. He grudged no effort or time in the investigation of his cases, and must have accumulated a large body of most careful and searching notes. He was too diffident of his own prowess, perhaps his ideals were too high. But had he lived longer, and had his health permitted, several contributions of great clinical and scientific value might have been expected from him. Although always cheerful and ever eager to respond to any call to work, he had for many years been handicapped by his health. More than once in recent years he had been obliged, on medical advice, to take a prolonged holiday. But he had an unconquerable passion for work, and had no sooner returned to the city than he was found to be under taking duties beyond his real strength. This was shown in the prompt offer of his services to the Army authorities when the war broke out, and there can be no doubt that his unstinted devotion to these services in a trying climate was the immediate cause of his death.

Perhaps because of his own health he had begun earlier in his professional life to make a special clinical study of tuberculosis, and had for several years before his death become one of the two or three leading clinical authorities and consultants in Scotland on this disease. He prepared an admirable and elaborate thesis on the value of X rays in the diagnosis of pulmonary tuberculosis which obtained for him his Doctorate of Medicine with honours. He was one of the first in this country to advocate and publish a comprehensive scheme for combating tuberculosis. Some years later, when a scheme was finally put into practice in Aberdeen by the municipality, he voluntarily undertook to give for nearly two years invaluable aid in developing and supervising the clinical part of the scheme. The clinical records thus obtained by himself and under his supervision are almost unique in their completeness.

He inherited much of the scientific instinct of the Lister family, and he had all the gentleness and charm of manner of his distinguished uncle. He was an excellent clinical teacher, and was beloved by his pupils. If it were possible he was still more beloved by his patients. His colleagues found in him a constant example of great ability with great modesty, of eagerness to learn from all with an equal readiness to impart, and of a knightly sense of courtesy and honour. This terrible war has brought to Aberdeen, as elsewhere, many notable losses, but no death is more widely and deeply mourned in our city than that of Arthur Lister.

THE ROCKEFELLER INSTITUTE FOR MEDICAL RESEARCH—The board of scientific directors of this foundation announce the following promotions and appointments. Dr A R Dochez, hitherto an associate in medicine, has been made an associate member, Dr H T Chickering has been appointed resident physician in the hospital, to succeed Dr Dochez. The following have been made associates: Dr Louise Pearce (pathology and bacteriology) and Dr F L Gates (pathology and bacteriology). The following have been made assistants: Dr O Robertson (pathology and bacteriology) and Mr E Wildman (chemistry). The following new appointments are announced: Dr Rhoda Erdmann, associate in the department of animal pathology, Dr R A Morrison, assistant in medicine and assistant resident physician, Dr J Northrop, assistant in the department of experimental biology, Dr Jean Oliver, assistant in the department of pathology and bacteriology, Dr E Smillie, Fellow in the department of animal pathology, Dr W D Witherbee, assistant Mr H Wasteners, hitherto an associate in the department of experimental biology, has been appointed as associate professor of pharmacology in the University of California. Dr F C McLean hitherto an assistant resident physician in the hospital of the institute, has been appointed by the trustees of the Union Medical College, Peking, to the professorship of internal medicine, this appointment carries with it the headship of the Union Medical School. The Union Medical College is one of the institutions of the China Medical Board of the Rockefeller Foundation. Dr McLean is now going to Japan, Korea, and China as representative of the China Medical Board.

OBITUARY OF THE WAR

HUBERT COWELL MULKERN, M R O S E N G ,
L R C P L O N D ,

CAPTAIN ROYAL ARMY MEDICAL CORPS

Captain H C Mulkern, who was killed in action in France on July 1st was a student at St. Mary's Hospital Medical School where he entered in 1899 taking his medical qualification in 1906. At this time he was a keen association football player, and was a trooper in the Westminster Dragoons.

After qualifying he settled in practice at Kingston-on-Thames where he made a large connexion. At the outbreak of war he at first took a post as civil surgeon to the Dépôt Hospital, East Surrey Regiment, and later obtained a commission in the Royal Army Medical Corps, being attached to the Northumberland Fusiliers. After other transfers he finally became battalion medical officer to the 9th Royal Inniskilling Fusiliers and remained with

them until he met his death. He was shot through the neck as he was standing close to his dressing station and death was almost immediate.

His commanding officer wrote of Captain Mulkern to his mother "He had endeared himself to all ranks in a remarkable degree, to me personally he was a very dear comrade often consulted him and he was a great support to me in many ways." And a senior medical colleague adds "Mulkern was absolutely fearless. I knew him intimately, and he was one of my officers for whom I had the greatest admiration and regard."

Captain Mulkern married in 1907 Miss Florence Vouler, who predeceased him.

HAROLD GARRETT CHAPLIN M D L O N D ,
M R C S E N G , L R C P L O N D ,

Surgeon ROYAL NAVY

Surgeon H Garrett Chaplin who lost his life, at the age of 28 years when H M S *Hampshire* was sunk on June 5th, was the third son of Mark Chaplin merchant of St. John's Newfoundland. He received his early education at the Methodist College, St. John's matriculating in 1907 as an outside student in the London University.

In the following year he entered St. Thomas's Hospital, London, where he had a distinguished academic career, graduating with distinction in medicine and surgery in 1914 and being gold medalist for that year. At the outbreak of war he resigned his post of house surgeon and obtained a commission in the Navy. He first served on H M S *Victory* then on the

hospital ship *Acadia* where he had ample scope in tending Belgian wounded and refugees and was finally transferred to H M S *Hampshire* where his family was informed that he died at his post doing his duty. One of the few survivors stated that the last he saw of

Chaplin was in his shirt-sleeves, bandaging the wounded after the explosion, the ship was then sinking."

A relative writes to us that Surgeon Chaplin had throughout his short life responded to the call of sacrifice without counting the cost. His powers of resistance had been severely tested on two occasions. Once with two companions, all in their teens, he had travelled on foot across the barren wilds of Newfoundland reaching his destination at the point of exhaustion. Again on a sailing vessel adrift in the Atlantic without food or water he was only rescued after 92 days' buffeting by wind and wave as the ship was sinking. His last adventure was doubtless nobly borne.

ERNEST CHARLES LAMBERT M R O S E N G ,
L R C P L O N D M D B R U X ,

LIEUTENANT ROYAL ARMY MEDICAL CORPS

Lieutenant E C Lambert, who died of wounds in France on June 30th at the age of 41 years was born at Redhill and educated at Redhill Grammar School, where he gained two scholarships. He took his medical training at Westminster Hospital, qualifying at the age of 22, when he was appointed assistant medical officer and pathologist to the Darenth Asylum. After 14 months he applied for a transfer owing to ill health and was given a similar post at Banstead. During his residence there he went to Brussels, graduated M D of that University in 1903 and finally settled in private practice at Wandsworth in 1905 becoming assistant medical officer to the workhouse. He joined the Royal Army Medical Corps in November, 1915, and after some months' training with the 12th Surrey he left for France in the spring.

Whilst attending a wounded man on the night of June 22nd a shell burst at his feet, covering him with wounds. His condition was serious but his commanding officer wrote that there was good hope of his recovery, and spoke of the pluck and cheerfulness with which he bore his pain. Unfortunately, however, when two or three days later he was removed to the base hospital hemorrhage occurred, and he died of his wounds. Lieutenant Lambert leaves a wife and two small children.

A colleague writes of him "Lambert was the ideal type of general practitioner gentle and generous to the poor, wise and kindly to all. His loss will be felt quite as much for his quality as a man as for his capability as a doctor."

DEATHS AMONG THE SONS OF MEDICAL MEN

The following sons of medical men must be added to our lists of those who have fallen during the war—

- Second Lieutenant R L Binns Yorkshire Regiment, son of the late Dr W Binns East Bergholt, Suffolk.
- Captain L O Crombie, Middlesex Regiment, son of Dr J Crombie of Sidcup Kent.
- Second Lieutenant H Latimer, Royal West Kent Regiment, only child of Dr H A Latimer, of Tunbridge Wells.
- Lieutenant E V Cheese Army Pay Department, younger son of the late Dr J Cheese of Wimbledon, London.
- Second Lieutenant F I Young Northumberland Fusiliers, sixth son of Dr R Young of Roston Lanes.
- Second Lieutenant D D R K. Moor, Yorkshire Regiment, second son of Major J D Moor R.A.M.C., of Bawswater, London.
- Private R C Power, Royal Fusiliers, only son of Dr E T Power of Atherstone Warwickshire.
- Captain A C O Connor Norfolk Regiment only son of Colonel A P O Connor C.B. A.M.S.
- Second Lieutenant P M Alexander Gordon Highlanders, eldest son of Dr S P Alexander, of Southsea.
- Captain V G Duke Royal Garrison Artillery, son of the late Colonel A W Duke R.A.M.C.

Lieutenant A. L. H. Ferguson, Gordon Highlanders, son of the late Surgeon Major Ferguson
 Lieutenant S. Jalland, East Yorks Regiment, youngest son of Mr W. H. Jalland, F.R.C.S., of York.

THE CENTRAL MEDICAL WAR COMMITTEE

A meeting of the Committee was held on Wednesday, August 9th, when the Committee was reappointed with certain modifications among the *ex officio* members resulting from the changes in the officers of the British Medical Association. The *ex officio* members of the Committee are now Sir T. Clifford Allbutt, President of the British Medical Association, Mr E. B. Turner, chairman of Representative Meetings, Dr J. A. Macdonald, chairman of Council, and Dr G. E. Haslip, treasurer. Dr T. Jenner Verrall was re-elected as chairman of the Committee for the ensuing year, and the Executive Subcommittee and secretaries were re-appointed.

The Reference Committee of the English Royal Colleges

The work of the Committee of Reference of the English Royal Colleges has been of great value in assisting the Central Medical War Committee, for the exemptions of medical men attached to hospitals in the London area have been a difficult and delicate matter of arrangement. There still seems to be a doubt in the minds of some admirably philanthropic persons as to whether there is really a war proceeding on which the very existence of the nation depends. They regard interference with the organisation of the institutions in which they are interested as unthinkable, in spite of the country having willingly adopted compulsory service. They speak of this or that member of the staff as indispensable, meaning thereby that the particular officer has made himself so generally useful that the hospital authorities would find themselves in a difficulty if he were to leave. It has actually been stated by a governor of one hospital that if Dr So and So is taken, the hospital must close—a scathing criticism on the gift of organisation possessed by the hospital authorities. When the so-called indispensable members of hospital staffs are comparatively young unmarried men, they are just the men who, in these strenuous times, are indispensable to the nation, and the only consideration that should be allowed to weigh with the institutional authorities is the question of whether a man is indispensable to the nation in some capacity or other. If the young doctor becomes indispensable to the nation, he must be allowed to take a commission and his work must be distributed amongst those who are allowed to remain at home, or who are over military age.

This is very obvious to all of us in a general way, but when the work of a splendid charity is in question it is hard for those whose energies are absorbed in the conduct of its affairs to realise where the sacrifice of personnel should begin and end. It is in just these difficult positions that the work of the Central Medical War Committee, through the Reference Committee of the English Royal Colleges, has proved so useful.

"PRO PATRIA."—We have received from Sir Lauder Brunton a communication indicating the need for a directory to hospitals for sick and wounded combatants and other agencies providing for assistance, relief, and guidance in these days of national testing. Under the title of "Pro Patria," a guide to public and personal service in war time will be issued immediately. The work has been prepared under the editorial supervision of Dr T. N. Kelynack and it is to be published by Messrs John Bale Sons, and Danielsson, Limited, at 3s. 6d. net. The volume will contain original communications from Lord Sydenham, Sir James Yorrell, M.P., Sir Robert Baden-Powell, Mr Charles W. Cathcart, F.R.C.S., Sir Henry Morris, Professor F. J. O'Hearnshaw, Professor J. S. Mackenzie, Mrs Fawcett, Major Leonard Darwin, and others. The main part of the volume is devoted to signed authoritative communications regarding the aims and work of the chief associations and institutions rendering public and personal service in war time. Lists are also provided of the names, addresses, number of beds of the chief Red Cross hospitals, the names and addresses of the county directors of the Joint Committee of the St. John Ambulance Association and the Red Cross Society, the Presidents and honorary secretaries of the branches of the British Red Cross. There is also a bibliography of patriotic and war books and much other material likely to be of practical service.

Correspondence.

TUBERCULOSIS AND THE WAR

To the Editor of THE LANCET

SIR,—The address by Sir William Osler on the tuberculous soldier in your issue of August 5th must carry conviction owing to the manner, at once scientific and humane, in which the problem is presented, and by virtue of the fairness of his conclusions. Nevertheless, I beg to dissent from some of the suggestions, which do not appear to be corollaries to his main proposition.

Sir William Osler's classification of the types of tuberculous combatants does not differ, to any great extent, from the grouping suggested in my letter of June 3rd and he also believes that no great increase in tuberculosis is to be expected in that portion of the community which has undertaken military service, and again agrees that the treatment of these cases after discharge should be undertaken by the civil authorities. Now the machinery for treatment is already in our hands, provided local authorities can be induced to do their duty. That they have not done so is due to want of central clinical and administrative control. If the welfare of discharged tuberculous combatants is to be placed in the hands of a small central committee of the National Association for the Prevention of Tuberculosis in conjunction with representatives from three other public bodies, it is likely to encourage slack local authorities in their desire to allow other people to do the work and bear the expense. Sir William Osler does not suggest a new name for this committee, but he is virtually creating a new society without rendering himself liable to the extreme penalty which he advocates for those who do so.

The considerations which lead me to express this dissent are as follows. As the primary duty of the medical departments of the services is to raise and to maintain the health of our combatants at the highest degree of fighting efficiency it would be against the national interest to ask that they should organise and carry out schemes for treating those invalided on account of tuberculosis. This treatment must be left to the civil authorities. In the United States early the institution of naval sanatoriums was followed by a rise in the ratio of tuberculosis, owing to the tendency to discharge cases of arrested disease to duty, since service afloat is contraindicated for every tuberculous subject. On the other hand it might be maintained that if full inquiry showed the incidence of tuberculosis to be increased by the conditions of active service the service departments concerned might make a grant to those civil authorities on whom the burden of treatment must eventually fall.

Even if the service authorities provided sanatorium treatment for all tuberculous invalids little would be done to eradicate the malady, since the men would return to home conditions under which the disease would again develop and spread. Some have advocated "segregation camps" in which the invalided consumptive would be compelled by law to reside until he died. Apart from its inhuman interference with individual liberty, this scheme would only do harm. Compulsory segregation is in vogue in the city of New York without having any influence on the death rate, since the patients prefer to hide the fact of their illness and creep away to garrets to die without medical attendance. Moreover, this scheme does not touch the silent stream of tuberculous infection flowing through childhood to adult life in our great industrial centres, and finally breaking out as active declared disease. All these schemes are old heresies long since hunted from pillar to post and to the stake.

A more dangerous doctrine has recently been promulgated to the effect that direct measures against tuberculous infection are of little value, and that if all the money spent on dispensaries and sanatoriums had been devoted to improvement in the housing of the poor the results would have been better. It is pointed out that in Scotland between 1850 and 1880, prior to any attempt to check infection, the fall in the phthisis death rate was so great that had it continued the disease would now be well nigh extinct and that this fall was associated with improvements in general sanitation. These facts are true but the deduction

drawn from them belongs to that class of falsehood which Leonardo da Vinci held to be unpardonable. Improved housing does raise the general resistance of a populace to tuberculosis or any other infectious disease. We know that an animal in good condition will succumb less readily to experimental infection than an animal in poor condition, but so long as we are dealing with an infectious virus there is a point at which massive or long-continued infection will overcome the resistance of the best-conditioned animal. It will always be possible for a careless consumptive to infect his family whether they be housed in a well built or an ill built house.

There have recently been cases of tuberculous men, discharged from the services, dying in Poor law infirmaries, and these cases have aroused protests in the lay press. Now an intelligent interest in tuberculosis even if only awakened by the thunder of a European war, is to be welcomed but to those who have been working for years to kindle that interest it has always seemed unjust that a preventable disease, such as tuberculosis, should entail the death of any man or woman soldiers broken in our industrial wars, under the Poor law. When this does occur in any area it implies a certain want of provision for the treatment of tuberculosis on the part of the civil authorities. Men discharged from the services return to civil life and must be considered as part of the civil community.

The day is long past for controversy as to the best methods for the treatment, control and eradication of tuberculosis. Every local authority has had the guidance of the Departmental Committee on Tuberculosis, and has been urged to adopt a co-ordinated scheme in which the essential elements are the tuberculosis dispensary, the open air school, the sanatorium, the working colony, and the hospital for advanced cases. In this the Committee endorsed the salient features of the Edinburgh system founded by Sir Robert Philip in 1887 and since adopted throughout the world. The literature on the subject is already so large that it is not necessary to burden this letter with a description of the integral parts of the machinery provided by that scheme.

Certain difficulties do exist in the matter of its effective execution and some of these may be briefly stated. The examination of contacts in the homes of patients, the most essential part of the work of the dispensary, is often not only an arduous task, but also demands a high degree of clinical skill since it concerns the earliest diagnosis of pulmonary tuberculosis. Considerable experience of general medicine is no less essential for the dispensary medical officer since he acts as a consultant with practitioners who are treating insured patients. To put the matter frankly, an experienced clinician will not be attracted by a low salary. Again if the tuberculosis officer is to rank as an assistant medical officer of health, and if his advancement in the Public Health Service can only be by promotion to an administrative post two contingencies are likely to arise. If he has devoted many years to gain clinical acumen, not easily won, his skill will be largely lost to the community on his promotion to a purely administrative post divorced from clinical work. Again, if he early begins to lean towards the administrative rather than to the clinical side of his work the effective control of tuberculosis in his area will suffer in proportion.

The Public Health Service in the United Kingdom admittedly the first and most efficient in the world has recently developed to so great an extent that it now covers a very large part of the field of medicine. It is concerned with the feeding of infants, the health of school children, the treatment of the exanthemata, the diagnosis of tuberculosis and to-morrow with venereal disease—all these in addition to the general problems of hygiene and sanitation. It is surely just, and in the public interest, that in a service so specialised equal awards and emoluments should be the reward of clinical no less than of administrative ability. This has already been carried out in the city of New York, where the heads of the various departments of the Board of Health stand on an equal basis. If the machinery now in our possession for the control and eradication of tuberculosis be erected on these lines in every area and if possibilities for extension which lie in the future the problem of tuberculosis will be solved.

I am, Sir, yours faithfully

HALLIDAY SUTHERLAND

August 7th 1916

THE FARADIC COIL AS AN INSTRUMENT OF PRECISION

To the Editor of THE LANCET

SIR,—I was glad to learn from Professor J. N. Langley's letter published in your issue of July 22nd that physiologists do not rely in their experiments on faradic coils of the ordinary type. The outsider naturally draws his conclusions, however, from the occasional papers which physiologists contribute to the clinical journals and from the information given in standard text-books of physiology. In Professor Langley's article in *THE LANCET* of July 1st the expression 'faradic currents' is used without qualification or explanation. Again, taking 'Halliburton' and 'Howell' as standard English and American text-books respectively, one finds the usual sledge coil with vibrating hammer described and pictured in each, and one is left to infer that it is the current from such an instrument to which physiologists refer when they speak of 'faradism.'

Although I am not familiar with the writings quoted by Professor Langley and, in a later letter, by Dr. E. D. Adrian, I am well acquainted with the views of the late Dr. Lewis Jones on the subject of the measurement of electrical stimuli. After considering all the modifications and improvements of the induction coil including the use of rotatory interrupters and the electro-static voltmeter, he concludes that 'the coil is bound to be superseded where exact work and the measurement of results are required.' To obtain tetanising currents he recommends the galvanic current interrupted by a 'Leduc commutator' or a rapid series of condenser discharges. The 'Leduc commutator' is accurate and extraordinarily flexible but difficult to handle. The Lewis Jones condenser instrument as recently modified is extremely simple, and no less accurate within the range of its 15 gradations.

Whatever may be the case with physiologists, it will scarcely be denied that the faradic coil generally used by clinicians in nerve testing is not an accurate instrument. Professor Langley's comparison of such a coil to 'an ordinary thermometer' calls for sharp challenge. Curiously enough, in my paper on the use of condensers in *THE LANCET* of Feb. 19th, I made use of the same analogy, but for a different purpose. 'Conceive men using clinical thermometers without scales, filled sometimes with mercury and sometimes with spirit, and having varying bores of unknown dimensions. Individual physicians might, and no doubt would become remarkably expert in the use of the particular instrument which they possessed, but records of their cases would be of only small value to other observers.' If nerve testing as usually carried out were as exact as temperature taking with an 'ordinary thermometer' there would be no need for reform. But medical coils differ in their voltage in the length of the individual impulses produced, and in the rate of discharge, to name only some of the factors which modify muscular response. They thus resemble the crude imaginary thermometers of my illustration.

It is not important that condensers in particular should oust the coil in diagnosis. It is vital that some instrument both flexible and accurate should be employed, so that the experiments of one observer may be precisely repeated by others. Only thus can data be collected which are of real value.

I am, Sir, yours faithfully,

F. HERNAMAN JOHNSON

Carendish-square W. July 30th, 1916.

THE RECRUITING OF THE UNFIT

To the Editor of THE LANCET

SIR—A few weeks ago I called your attention to the case of a hemophilic being passed for the Army. It is common to hear the wondering remark, 'So-and-so has passed the doctors!' In many cases the wonder is pardonable. The case of a man leaving our local sanatorium and having a fancy A case, whom I certified to be suffering from phthisis, had a 'beautiful soldier's funeral' a few months ago not many yards from here. The growing scandal of passing the medically unfit into the Army has caught the public eye in a more dramatic style than the medical press could be expected to adopt but why leave this serious matter to a popular weekly paper? The examining doctors receive hundreds of stupid and trivial medical certificates,

which meet with the contempt they deserve. On the other hand, there are some certificates which require more attention—viz., those relating to tuberculosis, stricture, epilepsy, bromophilia, duodenal ulcer, middle ear disease, specific cerebral disease, and so on. Such cases should be rejected, unless it can be shown that there is nothing the matter with them—that is to say, that the medical certificate is wrong.

Most of the insurance companies have this question on their proposals: "Have you ever had any illness or accident?" I have not yet found a soldier to whom such a question has been put.

I am, Sir, yours faithfully,

ROBERT TURNER, M.D., F.R.C.S.

Boottle Liverpool, July 31st 1916.

TREATMENT OF CARRIERS OF AMOEBIC DYSENTERY

To the Editor of THE LANCET

SIR,—For the oral administration of emetine we have in "Alcresta" ipecacuanha another form of the drug which possibly may not be generally known. It consists of the alkaloids of ipecacuanha mixed with clay. Each tablet contains 0.15 grain of emetine, and it is stated that as many as 20 tablets can be taken without unpleasant effects. I have used this form of emetine at Liverpool for some time, and in doses of 5 or even 10 tablets a day—that is, 1½ grains of emetine. I have only exceptionally noted any unpleasant effects. The therapeutic action on *E. histolytica* cysts is so far as my experience at present goes, distinctly encouraging.

I am, Sir, yours faithfully,

J. W. W. STEPHENS,

Sir Alfred Jones Professor of Tropical Medicine
The University, Liverpool

August 3rd 1916

IMMOBILITY AFTER JOINT INJURY

To the Editor of THE LANCET.

SIR,—While agreeing with many of the points raised by Sir John Collie in his article under this heading in THE LANCET of August 5th, may I take exception to what, after all, forms the thesis of his paper, the statement that "immobilisation of a joint is inevitably followed by adhesions"? As an earnest disciple of Mr. H. O. Thomas and one who believed that the battle waged by him against the professional pundits of his time had been long ago permanently settled in his favour, I am filled with dismay that a physician of such learning and authority as Sir John Collie should hold such retrograde views. The early movements he recommends produce far worse results than the prolonged fixation he deprecates.

Will you, Sir, allow me space to state briefly the principles which guide surgeons in the treatment of these cases?

1. A joint the subject of recent injury is a joint suffering from inflammation.

2. Such a joint must be kept immobilised in the ideal position until the inflammation has entirely subsided. In some cases this will only take a few days, in others, weeks or even months will be required. While immobilised the skin over the joint is to be daily stroked and the joints distal and proximal to it put through their full range of movement (Lucas-Championnière).

3. After all signs of inflammation have gone the patient is to be gradually allowed to use the limb, he is not to be hurried, he is to be encouraged to take his time over it. All forcible passive movement is contra-indicated.

4. Keeping the joint immobilised in this manner does not cause adhesions or stiffness. In elderly subjects who have passed their prime there is a likelihood of stiffness following injury to a joint, especially in the joints above and below it. The best way to prevent this is to treat the case in the manner described above, but its prevention or cure cannot be guaranteed.

5. Stiffness remaining in joints after injury is usually due to too much early movement before the inflammation set up by the injury has subsided, it is rarely due to insufficient movement.

I trust that others will join in publicly denying that immobilisation of a joint is inevitably followed by adhesions.

I am, Sir, yours faithfully,

PAUL BERNARD ROTH, F.R.C.S.

Dulc, Cornwall August 7th 1916

THE "SEDATIVE POOL BATH"

To the Editor of THE LANCET

SIR,—I venture to think that one of the most important of Major Tait McKenzie's statements in his paper at the Section of Surgery in the Royal Society of Medicine on the Use of Physical Remedies for Convalescent Soldiers relates to his use of the pool bath at a temperature of 94° F. It has long been known to hydrologists that baths of this kind increase the force of the heart's action and diminish its frequency, that they have a thermal effect either plus or minus, that they substitute for a multitude of varying peripheral impressions one unchanging massive impression, and that they are markedly sedative to the nerve centres. The sedative action is more pronounced when the duration of the bath is increased, which can be safely and pleasantly done to two, four, and more hours and even days and weeks. It seems permissible to call pool baths of this description "sedative," as they are not stimulants in the sense that hot and cold baths are stimulants although they have, it is true, certain stimulating qualities. All suitable cases however, are marked by one form or another of neurovascular irritability—rapid heart (whether functional or partly organic), high arterial tension, nervous and mental depression, restlessness and insomnia, many cases of "shock," neuritis and neuralgia. A similar form of bath may be used with the best results in acute septicæmia and save limbs as well as lives.

Major McKenzie's bath is the first of its kind in England—but I hope it will not be the last. It is pleasant to the patient, absolutely safe and its action rests upon a firm physiological basis. It was put before the Army medical authorities early in the present year and the "sedative pool" forms the central part of the "model bath installation for hospitals" described and figured in the *Journal of the Royal Army Medical Corps* for May 1916. I trust that the example of Heaton Park will be widely followed, and the results in due time communicated to the profession.

I am, Sir, yours faithfully,

R. FORTESCUE FOX

August 8th 1916

EARLY ETHER ANALGESIA

To the Editor of THE LANCET

SIR,—With reference to Dr. D. P. D. Wilkie's communication to THE LANCET on July 15th last, it may be of interest to say that his method has been used by me for the last 15 years, but using chloroform instead of ether, and his account accurately relates my experience except on one occasion when trying to remove a toe-nail I failed probably diverted by the shout of the patient he described. For setting a fracture, removing splints or painful dressings, or any operation requiring under two minutes it was quite efficient and successful, the point being as Dr. Wilkie emphasises to apply a considerable quantity straight away. I never measured the quantity, but I always saturated the lint on the Schimmelbusch mask with chloroform. It must be remembered that the primary analgesia diminishes or ceases at the end of two minutes, and is a sort of surprise from which consciousness of pain recovers before permanently succumbing.

I may state in addition when giving chloroform for tooth extraction, even if the patient appears partially conscious a few drops administered after the operation removes all memory that may have existed.

I am, Sir, yours faithfully

Middlebrough August 7th 1916

H. A. FLINT

RAILWAY TRAVELLING IN INDIA IN THE HOT WEATHER

To the Editor of THE LANCET

SIR,—In reference to the leading article in THE LANCET of July 29th, may I point out certain considerations that possibly influenced the authorities in India in ordering the movement of troops from Karachi up country that resulted in such a lamentable loss of life?

1. The selection of Karachi as the point of disembarkation instead of Bombay may have been due to the fact that the length of the railway journey to Lahore from the latter port is 1233 miles and from Karachi 820 miles. Presumably the

THE LANCET August 5th p. 21.

troops would be sent to some hill station at any rate they would almost certainly be quartered in the Punjab or near the North West Frontier. If they were designed for Baluchistan, of course there could be no question as to Karachi being the port of disembarkation.

2 The troops having arrived at Karachi where possibly there was no sufficient, or suitable accommodation available their removal up country was a necessity, they could not be put under canvas at this season, and they had to be moved on.

3 As to the question of day or night travelling of course night travelling at this season is less trying but there is not very much to choose between them.

4 There appears to have been some relative overcrowding 30 men in carriages for 36. This was wrong and no satisfactory reason for the deficiency is obvious, presumably the railway authorities were made acquainted beforehand with the number to be accommodated.

5 Many men appear to have left their carriages and to have stood bare-headed in the sun. This should not have been allowed but it would have been a matter of some difficulty to prevent it absolutely with inexperienced troops. The alternative that men should have been forbidden to leave their carriages when the train was at a halt, for watering the engine or other reason, is absurd and unthinkable. Except for the scanty accommodation, every provision appears to have been made: hospital carriages for casualties, a coffee shop and a good supply of ice which was moreover available at various stations in ample quantity. Three medical officers also were detailed for the care of the draft—a very liberal allowance. The number of casualties is much to be regretted and unless either there was no suitable accommodation for these troops near Bombay or else their presence was required up country their transport by train would seem to have been as inadvisable as it was contrary to usual practice. The officer in command was however, as fully aware of this as any of his critics and until his explanation is made known we are not justified in assuming that he was to blame. Presumably he acted on medical advice.

I am Sir yours faithfully

THE WORK OF THE REGISTERED HOSPITALS FOR THE INSANE

To the Editor of THE LANCET

SIR—Dr Henry Rayner's dissertation on 'A Serious Defect in Some of the Registered Hospitals for the Insane' in THE LANCET of July 29th, is an elaboration of some remarks which appeared in the July number of the *Journal of Mental Science* in a review of the report of the Board of Control. Dr Rayner is wrong in supposing that registered hospitals were primarily founded "for the charitable assistance of persons of the educated class suffering from mental disorder." They were primarily founded in deference to a widely prevalent opinion that the principle of a speculation for private profit applied to the care of the insane is in itself objectionable. Founders of registered hospitals proposed to afford to persons in easy circumstances better accommodation and better treatment for which they will be charged something less than at private asylums. It is obvious that if all profits were applied to the improvement and development of the hospital this object of the founders was likely to be accomplished. Dr Rayner says that it has been accomplished. He says that the admirable and successful management of these institutions is vouched for and that it would be difficult to praise too highly the medical treatment of the patients committed to their care. The second not the primary purpose of the founders of hospitals was to provide accommodation for persons of the same social class as the form but of moderate means at low rates proportional to their means. It was recognised that persons of this class are usually kept at home when first attacked without adequate care and treatment and with the too frequent result consequent on the neglect of the early and curable stages of the malady of being committed to a hopeless and incurable insanity. Hospitals make and make provision for these patients. I can speak for the practice in one hospital and I have reason to believe that it prevails in all of them. Each application for admission at a rate of payment below the usual minimal charge is carefully considered by the committee. Certain conditions

prescribed in the regulations and based on the intention of the founders must obtain. 1. The patient must belong to the social class for whom the hospital is intended. The wisdom of this provision is apparent when it is remembered that the classification of patients, after admission is based entirely on their mental condition. Discrepant social elements would make this impossible. 2. The patient's illness must be recent in origin and presumably one which will yield to treatment. This condition is intended to encourage the early treatment of cases and to guard against crowding the hospital with patients for whom only supervision, not treatment is required.

In the hospital with which I am most familiar 58 applications for payment at rates below the minimum charge were considered in the last three years. Of these 45 were granted and 13 were refused as not coming within the prescribed conditions. This would seem to show that the committee have availed themselves of the opportunities they have had of giving financial assistance to those for whom it is one of the purposes of the hospital to make provision. If effect were given to Dr Rayner's suggestion that a lower rate of expenditure should be adopted with consequent depreciation in the quality of the accommodation and of the services offered no doubt hospitals would be removed from 'rivalry with other institutions.' But surely it is unreasonable to suggest that committees of hospitals out of consideration for 'other institutions' should halt in their efforts to maintain the hospitals in the highest possible state of efficiency for thus would they deprive patients "in easy circumstances" and those of moderate means of those conditions for their care and treatment which the founders of the hospitals desired to secure for them.

I am Sir, yours faithfully

MEDICAL SUPERINTENDENT OF A REGISTERED HOSPITAL

Medical News.

ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND.—At a meeting of Comitia of the Royal College of Physicians and of the Council of the Royal College of Surgeons on July 27th diplomas of L.R.C.P. and M.R.C.S. were conferred upon the following candidates (including 11 ladies) who have passed the Final Examination in Medicine, Surgery and Midwifery of the Conjoint Board and have complied with the respective by-laws:—

W. Loughborough Agar B.A. Oxon. Oxford and Birmingham Universities. Giridhar Clement Agarwala, London Hospital. Abdul Majid Ahmad B.A. Cantab. Cambridge University and Guy's Hospital. Edward Berle Alabaster Birmingham University. Marc Clare Albuquerque, Royal Free Hospital. Frank Macdonald Alchitt Westminster Hospital. Douglas Harris Anthony St. Mary's Hospital. Robert Aspinall Atkins Guy's Hospital. Keymer Atkin B.A. Cantab. Cambridge and Manchester Universities. Thomas Burton Bailey Cambridge University and St. Bartholomew's Hospital. Gideon Albertyn Beyers St. Bartholomew's Hospital. William Howard Blackburn B.A. Cantab. Cambridge University and St. Bartholomew's Hospital. Charles Eric Bond, B.A. Cantab. Cambridge University and University College Hospital. Edward George Paul Bousfield St. Bartholomew's Hospital. Clifford Viner Bainbridge, B.A. Cantab. Cambridge University and St. Bartholomew's Hospital. Harold George Broadbridge London Hospital. James Brooks Manchester University. William Wallace King Brown St. Thomas's Hospital. Leslie James Forman Bull, St. Bartholomew's Hospital. Gordon Ernest Burton B.A. Cantab. Cambridge University and St. Bartholomew's Hospital. Caro Philip Leslie Carrier Charing Cross Hospital. Percival David Hartopp Chapman B.A. Cantab. Cambridge University and Guy's Hospital. Philip Vield Cook, St. Bartholomew's Hospital. Mervyn Clement Cooper London Hospital. Joseph Monias Courtney St. Mary's Hospital. Francois Crisoz de Cottens M.D. Geneva. Ph.D. Zurich. Zurich, Geneva, and Middlesex Hospital. Frederick Graham Leslie Dawson and Frank Philip Gilbert de Smidt London Hospital. William Robinson Dickinson St. Bartholomew's Hospital. James Maitland Downie, B.A. Cantab. Cambridge and Glasgow Universities. Gerald Gordon Drummond St. Thomas's Hospital. William Hood Dyer L.D.S. Eng. London and Middlesex Hospitals. James Daniel Dyson Middlesex Hospital. William Coccarone Collins Easton M.B. Ch.B. Viet. Manchester University. Hector Eugene Elanysale L.M.S. Ceylon Ceylon and Middlesex Hospital. Daniel Davis Evans Cambridge University and St. Bartholomew's Hospital. T. M. Stenner Evans Cardiff and St. Mary's Hospital. Henry Walter Featherstone B.A. Cantab. Cambridge and Birmingham Universities. Frederick O'off Fehren Lodon Hospital. Justin Beauchamp Flamer-Caldera L.M.S. Ceylon Ceylon and St. Bartholomew's Hospital. William Russell Gabriel Middlesex Hospital. John Jones Gascoigne Edinburgh University and St. Bartholomew's Hospital. Ernest Thomas Gayer Brussels and University College Hospital. Leslie Somerville Gathorne B.A. Cantab. Cambridge University and Guy's Hospital. Edwin

Diplomas in Public Health were also conferred upon the following three candidates—

Reginald St. George Smalbridge Bond M.B. C.M. F.R.C.S. Edin.
 Fleet Surgeon R.N., Edinburgh University and University College
 Ethel Mary Minett, M.B. B.S. Lond. London School of Medicine
 for Women and University College and Henry Owen West M.D.,
 B.S. Lond. M.R.C.P. L.M.S.S.A. King's College

At the First Professional Examination of the Examining
 Board in England, held from July 18th to 22nd, the following
 candidates were approved in the undermentioned subjects—

Chemistry and Physics—Harry Barlow Liverpool University; Ivy
 Constance Beach and Margaret Gladys Bost London School of
 Medicine for Women; William George Thomas Bennett Manchester
 College; Francis Blackham special study; Israel Blidn Manchester
 University; Mary Burdell London School of Medicine for Women;
 George Frederick Burdell King's College; Kenneth Busck King's
 Burg St. Thomas's Hospital; Etouard Jean Joseph Busck King's
 College; Louis Ely Reginald Carroll St. Bartholomew's Hospi-
 tal; Marion Constance Vera Clarke London School of Medicine for
 Women; Leslie Barrett Cole Leighton Park School; Erexter
 Beatrice Lakeman Collins Royal Albert Memorial College; Erexter
 Reginald Norman Downing London Hospital; Robert George
 Eastwood and William Cyril Elton Leeds University; Wraswrya
 Vaughan Facey St. Mary's Hospital; Wernakula Wraswrya
 Joseph Fernando Middlesex Hospital; John Humdall Gann Birk-
 beck College; Thomas John Ernest Gittins Technical College
 Dudley; Harold Vernon Jessop Birmingham University; Agnes
 Knowles London School of Medicine for Women; Francis Richard
 B.A. Birkbeck College; Henry Davies Llewellyn Cardiff; Morton
 Alger McCabe Middlesex Hospital; James Ald Liverpool
 St. Bartholomew's Hospital; Guillelmo Bustillo Ojeda, Liverpool
 University; Daniel Joseph O'Meara, Guy's Hospital; Kenneth
 Owen Parsons Bristol Grammar School; Edwin Harold Rumping

 versity; John George Walker, Battersea Polytechnic; Erexter Wras-
 wrya; John Waller London School of Medicine for Women; Tudor
 Williams Cardiff; Eric Frank Wilson and John Edward Wright
 L.D.S. Eng. Guy's Hospital; Alfred Ernest Young L.D.S. Eng.
 Bristol University; and Charles Florence Young London Hospital

**MEDICAL OFFICER TO ELEPHANT ISLAND RELIEF
 EXPEDITION**—Temporary Surgeon G. N. Martin R.N., who
 has been appointed by the Admiralty Surgeon to the
Discovery, which is being fitted out by the Admiralty for the
 relief of Sir Ernest Shackleton's fellow explorers stranded on
 Elephant Island, has already had some exciting experiences
 in the Royal Navy. He was on H.M.S. *Cressy* when she was
 torpedoed early in the war and was rescued after being two
 and a half hours in the sea. He has since served in the
Emperor of India and has been employed on board a monitor
 on patrol service.

"INCAPABLE OF WORK"—A medical man recently
 in giving a certificate to an insured patient to secure for him
 sickness benefit qualified the words of the certificate "Form
 Med 40, by adding "unfit not incapable." It was the
 medical man's opinion that in the ordinary meaning of the
 word the patient was not incapable of doing work but
 was "unfit" to do it. The medical man claimed that according
 clearly as a person in such physical condition that he ought to receive
 to the intention of the Insurance Act he ought to receive
 the benefit provided but in the interest of accuracy in a cer-
 tificate he desired not to describe him as "incapable." The
 Friendly Society to which the insured person belonged declined
 to grant benefit upon a certificate in which the wording pre-
 scribed by the Commissioners for the use of the medical
 practitioner was qualified and the matter was referred to the
 Insurance Commissioners, of which the practitioner is a
 member. By this society the necessity of strict accuracy in
 medical certificates was dwelt upon in a letter to the Com-
 missioners and it was pointed out that in a large proportion
 of the cases certified under the Act the patients are in a

unfit for, rather than incapable of, work. The reply of the Commissioners to the London and Counties Medical Protection Society gives a view of the situation which is quite interesting. They state that in any case in which the patient is in a condition which would make it wrong, both in the interests of his own health and in the interests of his Approved Society, for him to go to work the doctor may, and indeed ought, in the opinion of the Commissioners, give a certificate of incapacity in the wording of Form Med. 40. The London and Counties Medical Protection Society has thus secured a definite statement from the Insurance Commissioners of the interpretation which they put upon the certificate and this should enable any medical man to use it with a clear conscience.

LONDON INTERCOLLEGIATE SCHOLARSHIPS BOARD.—The following Scholarships and Exhibitions have been awarded.—University College. Bucknill Scholarship (divided) M D Cadman, Newport Grammar School, and H A Harris, Cardiff University College equal. Two Exhibitions 1st (divided) M D Cadman Newport Grammar School, and H A Harris Cardiff University College, equal. 2nd, H G Goldwater, Rhodes University College. Grahams town S A. King's College. ROYAL MEDICAL BENEVOLENT FUND.—The following is a summary of the cases recently relieved.—

Widow aged 53 of M B Aberd who practised in London and died in 1913. Husband was addicted to drugs and left his wife and family totally unprovided for. The four children, all of whom are single do what they can to support the home but cannot provide sufficient. Voted £5.—Widow aged 69 of M R C S Eng who practised at Battersea and died in 1899. Applicant had managed to get along until a few months ago when it was necessary for her to be operated upon. The result was doctor's bills and extra help was required in her home. Wants a little temporary relief. Voted £5.—Widow aged 53 of L R C P & S Edin who practised at Blackpool and died in 1912. Husband was a bankrupt at his death and the applicant was left entirely destitute. She obtained furniture on the hire system and started a boarding house at Bognor. This has not been a success owing to the expensive food and the debt on the furniture. Voted £5.—Widow aged 42 of M R C S Eng who practised in London and died last month after a long illness during which all his savings were exhausted and friends had to help towards the end. Applicant is now living at the expense of friends who cannot afford to keep her and her two children aged 13 and 8 years. Voted £5.—Widow aged 57 of M B F R C S Edin who practised at Billingham and died in 1915. Applicant could manage but a large house left her by her husband is unlet, and there are certain charges to be met. She worked as a caretaker for some months but the work was only temporary. Has three children ages 3 to 7 and is much concerned about the education of her boy age 7. Voted £5.—An M R C S Eng paralysed who practised in Northants now completely incapacitated by paralysis. Only income 19s 6d a week allowed by children and a capital sum of £20. Three sons all have joined the Army in South Africa. Two are married and are unable to help. Three daughters two of whom live at home and the one working pays 13s 6d per week the other looks after her father. Voted £18 in 12 instalments.—Daughter aged 64 of registered practitioner who lived in London and died in 1899. Applicant has for a number of years lived in France and earned a living as a governess. When the war broke out she was working at Roye and lost all her belongings. She sheltered and saved at great risk to herself ten English soldiers and the Prime Minister made her a grant of £50 from the Royal Bounty Fund. She also received a letter of thanks from Lord Kitchener. Only able to earn a little now by giving occasional French lessons to soldiers at Rouen. Would like to get into a convent or home in England. Voted £12 in 12 instalments.—Widow aged 70 of M R C S Eng who practised at Heathfield. Left curable. Only income £20 derived from a Post Office annuity supplemented by a friend. Relieved eight times £20 last £12 in June. Voted £12 in 12 instalments.—M D Aberd, married, aged 63 who £70 per annum from other charities. Has three children, ages 5 to 18 times £73, last £12 in June 1915. Voted £12 in 12 instalments.—Widow aged 53 of L R C P & S Edin, who practised at Newquay and died in 1893. At husband's death was left with two sons now in the fractured her leg two years ago and still finds it difficult to get about. Relieved 13 times £125 last £12 in June 1915. Voted £12 in 12 instalments.—Daughters, aged 43 and 40 of M R C S Eng who practised in London and died in 1872. Left entire £5 without means and tried to since the war have not been successful. Helped by the Fund and Guild of L R C A Lond, who practised at Ipswich and died in 1901. Was left unprovided for with five children four of whom are now married the youngest being an apprentice and earning very little. Has tried to earn a living by taking in lodgers but has only one at present. Relieved 13 times £140 last £12 in June 1910. Voted £12 in 12 instalments.—

Daughter aged 69 of L R O P Edin who practised at Holloway and died in 1834. Was left without means a chronic invalid and only income a pension of £40 per annum from another charity all of which is required to pay for food and medicine. Relieved 12 times £103 last £12 in July 1915. Voted £12 in 12 instalments.—Widow aged 67 of M D Glasg who practised at Dennistoun and died in 1876. Was left unprovided for and tried to conduct a boarding house but had to give up owing to ill health. Only income a pension from another society of £12. Is now living with a married daughter whose husband is a private in the Army. Recommended by the Glasgow Branch of the Guild. Relieved nine times £95 last £12 in July 1915. Voted £12 in 12 instalments.—Widow aged 71 of M D St And who practised in London and died in 1915. Left unprovided for after husband's long illness. There are three children but they are only able to help very little. Has recently received a pension of £40 from another society. Relieved twice £14 last £12 in July 1915. Voted £12 in 12 instalments.—Widow aged 53 of M B Aberd who practised at Watlington and died in 1912. Left unprovided for and suffering from neuritis, and health thoroughly undermined through long nursing of husband, and children now dead. Relieved once £10 Voted £12 in 12 instalments.—Widow aged 51 of L R C P & S Edin who practised in Jamaica and died in 1893. Left without means and suffering from an incurable disease. Income £26 per annum from a society for helping incurables. Has one daughter aged 26 who is also an invalid. Relieved eight times £95 last £12 in July 1915. Voted £12 in 12 instalments.—Daughter aged 53 of M R C S Eng who practised in London and died in 1833. Health very bad in consequence of the long nursing of her mother. Income only £45 per annum. Wants a little help to enable her to take a short holiday. Relieved twice £10 last £5 in July 1915. Voted £5.—Widow aged 82 of M R C S Eng who practised at Leeds and died in 1909. Applicant is a chronic invalid the daughter who was ill for many years has recently died. Only income about £30 per annum. The Guild are much interested in this case and would like the Fund to supplement their efforts a little so as to enable the old lady to be properly looked after. Relieved once £12. Voted £12.—Daughter aged 61 of L R C P Glasg who practised at Mauchline and died in 1893. Applicant who is very delicate was left quite unprovided for. She is unable to work and her only income is a pension of £12 from another charity. Relieved nine times, £102 last £12 in June 1915. Voted £12 in 12 instalments.—Daughter aged 45 of M D Dub who practised in the Isle of Man and died in 1832. Applicant is a chronic invalid and is suffering from rheumatoid arthritis. Only income a little from friends. Voted £5 in November last per the Liverpool Branch of the Guild with leave to apply again. The Liverpool Branch strongly support this case. Voted £5.—Widow aged 54 of L R C S Irel who practised in Liverpool and died in 1904. Applicant was left entirely without means, her husband having spent all her savings and ill treated her. There is one son but he has not helped his mother for years. The applicant has been trying to struggle on by getting day work but recently had a stroke and her health is very uncertain. Voted £3 to be paid through a lady who is taking an interest in her. The case to come up again in October.—L R C P & S Edin aged 61 who practised at Leith. Married. Is suffering from locomotor ataxia and confined to bed since 1913. Has no means. His wife's income only £40 per annum. Relieved twice £35 Voted £18 in 12 instalments.—Daughter aged 65 of L R C S Irel who practised at Derby and died in 1870. Father left a large family totally unprovided for. Applicant has tried to earn a living by taking in lodgers but owing to ill health has had to give it up. A room provided by a sister but she cannot afford to keep it. Only income £5 a year from a friend. Relieved seven times £84 Voted £12 in 12 instalments.—Widow aged 63 of M D St Andrews who practised at Stepany and died in 1903. Was left unprovided for with four children all married and none able to help. Has tried to earn a living by letting rooms but owing to ill health unable to give proper attention to lodgers. Relieved 13 times £156 Voted £12 in 12 instalments.—Daughter aged 61 of M D Edin who practised in London and died in 1829. Ill health and age prevent her from obtaining permanent work, and only earns about £10 per annum by needlework. Relieved eight times £61 Voted £12 in 12 instalments.

THE MEDICAL EDUCATION OF WOMEN.—The Edinburgh University Court has received from Miss S E S Blair, chairman of the Edinburgh Hospital for Women and Children and Mrs A M Chalmers Watson, M D, an offer to pay £4000 within a year to defray the cost of undertakings intended to facilitate the medical education of women. The offer is made on behalf of women medical graduates, students, and their friends.

ILLEGAL TRAFFIC IN COCAINE.—At Marlborough street police court on Tuesday last four women and a man were convicted of illegal trafficking in cocaine. Mr Herbert Mussett, who prosecuted on behalf of the Commissioner of Police, stated that in consequence of the Order in Council dated July 28th, the authorities were no longer hampered by having to prove the sale of cocaine in the case of soldiers. Sergeant Gilbert Smith, of the Canadian Military Police and various detective sergeants gave evidence for the prosecution. Mr Denman sentenced three of the women—Fawdon Brady, and Meehan—to three months' imprisonment with hard labour and the fourth—Middleton—to two months' imprisonment with hard labour and a fine of £5. In the case of the male defendant Johnson, it was stated that he had been convicted at Canterbury of a similar offence and sentenced to six months' imprisonment, and that he had not long left gaol. The stipendiary sentenced him now to six months' imprisonment with hard labour with an additional fine of £100. The magistrate added that while some consideration as catpaws in this illegal traffic, the sentence on the man Johnson was a richly deserved one.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS

Reports of Certifying Surgeons

The Royal Assent has been given to the Police, Factories, &c. (Miscellaneous Provisions) Act, which contains a clause abolishing the reports of certifying surgeons, except in certain cases.

WEDNESDAY, AUGUST 2ND

Venerable Diseases and National Insurance

Mr RENDALL asked the representative of the National Insurance Commissioners what action the Government proposed to take on the resolution passed by the National Insurance Acts Committee to the effect that permanent disablement and serious illness, greatly injuring the State, were being caused by reason of the fact that insured persons suffering from venereal diseases were refused sickness benefit and medical attention under the National Insurance Act—Mr C ROBERTS replied I would refer the honourable Member to previous replies on this subject. I should like to point out that he is mistaken in supposing that persons suffering from venereal diseases are refused medical attention under the National Insurance Act. Section 14 (4) of the Act of 1911 precludes an insured person from being deprived of medical benefit on that ground.

Examining Medical Officers to War Office

Mr TOUCHE asked the Financial Secretary to the War Office whether civil practitioners who were appointed examining medical officers and had been so occupied under strain for a long period were entitled to a holiday, and, if so, if any and what difference in pay and holiday leave there was between practitioners engaged on a whole time or permanent basis and others whose duties were partial and temporary although remunerated at a fixed daily rate—Mr FORSTER (in a written answer) replied Yes, a holiday might be arranged if the work would be carried on in their absence. I am not aware that there is any difference such as that mentioned in the second part of the question, but perhaps my honourable friend would let me know more precisely to what different classes of practitioners he refers.

Mr TOUCHE asked why, when civil practitioners who were appointed examining medical officers were allowed 40s a day for a full day's work and lesser amounts for part of a day, there were practitioners in London doing duty from 9.30 to 5 who were still receiving only 24s a day, being the same rate of pay as that formerly allowed to them when they were doing only four hours daily, and would he take steps to secure more equitable treatment—Mr FORSTER wrote in reply The rate of 40s is a maximum, the actual payments depending upon the number of recruits examined. The 24s rate is for a period of regular employment. It covers whole time service. It is not proposed to make any change.

THURSDAY, AUGUST 3RD

Industrial Poisoning

Mr ANDERSON asked the Under Secretary for the Home Department (1) whether there had been a considerable increase in the number of cases of poisoning and of anthrax and toxic jaundice reported to him under the Factory and Workshop Act for the six months ending June, 1916, as compared with the same period of the previous year, whether the number of deaths was 30 as compared with 18 of the same six months of 1915, whether he could state to what this increase was due and how far it was attributable to relaxed factory inspection, and what action if any, he proposed to take; and (2) whether the number of anthrax cases had increased from 29 in the six months ending June, 1915, to 53 in the six months ending June, 1916 and what steps were being taken in this matter—Mr BRACE replied The figures for lead poisoning for the periods in question show a slight decrease but there has unfortunately been a considerable increase in cases of anthrax. There has been no slackening of inspection for the purpose of enforcing the regulations and the increase can only, I am advised, be accounted for by the fact that owing to the heavy demand manufacturers have been forced to use all kinds of material. The problem of prevention is being thoroughly investigated. The problem of prevention is being thoroughly investigated. The problem of prevention is being thoroughly investigated. It is good reason to hope that they will be able to put forward effective proposals. The notification of toxic jaundice—that is jaundice due to tetrachlorethane or certain other poisonous substances used in explosive works—as made compulsory for the first time this year, and this is the chief reason for the apparent increase in reported cases of poison in. The number of persons employed in the factories

concerned has also been constantly increasing. These factories have been subject to frequent inspection, and much has been done by improved mechanical ventilation, medical examination of the workers, and other precautions to minimise the danger. As regards poisoning from dopes containing tetrachlorethane, this danger should very shortly be eliminated altogether by the substitution of the non-poisonous dopes now being brought into use.

A Russian Medical Man

Mr KING asked the Financial Secretary to the War Office whether he had considered the case of a Russian doctor of medicine, a graduate of a Swiss university, who had been serving in this war in Serbia and only left when Serbia was evacuated by the Allies who had the medical services of this doctor been refused by the War Office, would he say why he was being pressed into the ranks as a private, and whether, in view of this Russian doctor having served with our Allies, the Serbians it was intended to deport this gentleman to Russia—Mr FORSTER answered With the information contained in the question I can only satisfy my honourable friend on one point. It is impossible to commission medical men who are not British subjects and whose degrees are not registrable in this country. If my honourable friend wants me to make an inquiry on the second point of his question he will, no doubt, be good enough to furnish me with the name of the doctor in question. My honourable friend has no doubt, considered whether he should not advise this Russian medical man who appears to have behaved very gallantly, to offer his services to the Russian Army through the Russian Consul General.

Sanitation at Rowleston

Mr HOME WILLIAMS asked the Financial Secretary to the War Office whether he was aware that since November 1914 repeated representations had been made both to the Local Government Board and to the military authorities by the local sanitary authorities and the East Riding county council as to the nuisance caused by the sewage from the military camp at Rowleston, in the East Riding of Yorkshire, that an assurance was given to the Local Government Board by the Army Council in March, 1916, that steps would be taken to remove any further cause for complaint that notwithstanding this serious cause for complaint did exist that there was still a nuisance which was a serious menace to the health of the inhabitants of the district, that one end of the field in which the camp was situated adjoined the seashore and that engineers who had inspected the site had advised that the sewage could, without serious expense be discharged into the sea, and whether he would give instructions for the necessary steps to be taken to abate the nuisance and for the work to be carried out forthwith—Mr FORSTER wrote in reply The sanitary engineering officer to the War Office has already arranged to visit the locality and to report upon the alleged nuisance and I hope to receive a full report in the course of a few days. This matter was brought to notice some six months ago but on inquiry it was found that at that time the arrangements made were satisfactory.

Military Hospitals in London

Mr KENNEDY asked the Financial Secretary to the War Office how many hospitals were in the control of his department in London, were the surgeons and medical advisers paid by the War Office and if so whether quarterly or monthly were the nursing staff paid quarterly or monthly and were these latter payments satiating same monthly or within what time after they became due—Mr FORSTER wrote in reply The number of hospitals in the London district is 186 of which 153 are auxiliary hospitals. A very large amount of the work performed in military and other hospitals in London and elsewhere is gratuitous. The surgical medical and some of the other staff paid by the War Office are paid monthly in arrears and the remainder are paid weekly. The rates of the nursing staff vary. There is no reason to suppose that the payments are not made promptly.

MONDAY, AUGUST 7TH

Medical Organisation of the Army in India

Sir HENRY (RAIL) asked the Secretary for India whether committees or commissions had been instituted within the last six years to inquire into the medical equipment and organisation of the Army in India, what action was taken upon their reports and whether these reports would be laid before the Mesopotamian Special Commission—Mr CHAMBERLAIN replied In 1912 a committee, of which Surgeon General Sloggett was chairman, inquired into the system of field medical organisation and equipment of medical units of the Army in India. Its recommendations were approved by the Government of India, and are now in force. The station hospital system for Indian troops was the subject of inquiry by another committee, which broke out, and as they related to peace arrangements.

their further consideration has been postponed. The reports will be laid before the Special Commission if the Commission should call for them.

Schemes for Treatment of Venereal Disease

Major ASTOR asked the Parliamentary Secretary to the Local Government Board how many councils of counties and county boroughs had submitted to the Board complete schemes for the diagnosis and treatment of venereal diseases, how many of these schemes had been approved by the Board, and how many were already in operation.—Mr HAYES FISHER answered. The regulations and circular were only issued about three weeks ago and no complete scheme has yet been submitted to the Board. Numerous negotiations and conferences have however already taken place, and I am glad to observe that considerable activity is being displayed by local authorities in carrying out the duties imposed on them.

Jaundice due to Dope.

Answering Mr ROWLANDS, Mr BRACE (Under Secretary to the Home Department) said. I am pleased to be able to say that not only has there been a considerable decrease recently in the number of cases of jaundice due to dope but that satisfactory dopes which are free from tetrachlorethane are now available in sufficient quantity, and that the War Office and Admiralty have directed their contractors to use only the approved dopes of this kind. It may be taken, therefore, that the danger from tetrachlorethane poisoning in this class of work has now been removed.

Unregistered Dentists and Cocaine.

In reply to Commander WEDGWOOD Mr H SAMUEL (Home Secretary) said. I have not seen any way to include unregistered dentists among the classes of persons authorised by the regulation to purchase cocaine. I have taken steps, however, to make available for the use of unregistered dentists a sufficient supply of novocaine which is an efficient substitute for cocaine and is used by many dentists and as this supply is not immediately available for use in the form in which it is usually required by dentists I have granted a temporary permit which will allow unregistered dentists to continue the use of cocaine in the interval.

Promotion in the Royal Army Medical Corps

Mr JONSON HICKS asked the Financial Secretary to the War Office whether lieutenants in the Royal Army Medical Corps had been given three years' acceleration of promotion after six months' service, but captains of 10 years' service had so far been given no acceleration, and whether having regard to the work done by the Royal Army Medical Corps captains at the front he would consider the possibility of acceleration of promotion in regard at least to some of them.—Mr FORSTER replied. My honourable friend is misinformed in thinking that no captains in the Royal Army Medical Corps have received accelerated promotion. As a matter of fact 145 captains have received such promotion, and each of them had between 10 and 12 years' service. The acceleration of promotion given to lieutenants does not in fact amount to as much as three years. I am informed that in the majority of cases it has amounted to less than 12 months.

TUESDAY, AUGUST 8TH

Nerve shaken Soldiers

Commander WEDGWOOD asked the Financial Secretary to the War Office whether he would indicate which classes of nerve shaken soldiers it was now proposed to discharge from the Army direct to pauper asylums, since the War Office had admitted that 198 had been discharged who did not belong to any of the three categories indicated last September and some of these had had very short treatment and up to the time of discharge had been described in medical reports as uncertifiable and progressing towards recovery.—Mr FORSTER wrote in reply. The following cases are certified: (1) cases of general paralysis of the insane, (2) chronic epileptics, (3) incurable cases and cases in which there is previous history of insanity.

Putcher Clothes for Military Nurses

Major Sir CHARLES HUNTER asked the Financial Secretary to the War Office whether the medical authorities at the War Office would take steps to provide rubber gloves for the nurses who did dressings in the military hospitals at home in order to prevent cases of septic poisoning.—Mr FORSTER replied. Every demand made by medical officers for rubber gloves for the use of nurses in military hospitals has been met. If the honourable and gallant Member has brought to his notice any case where such gloves are not available all that is necessary is for those responsible to make an indent.

Harrington Sanatorium

Mr McCULLY SCOTT asked the Secretary for Scotland whether any progress had been made in the efforts to secure the release of labour for the completion of the construction work of the Harrington Sanatorium at which the Middle Ward Committee of the Lanarkshire county council had pledged itself to afford accommodation for discharged tuberculous soldiers and to train them for outdoor occupation.

—Mr TENNANT said in reply. Yes, sir, I am glad to be able to inform my honourable friend that the answer is in the affirmative, and it is anticipated that the number will shortly be increased.

Illicit Traffic in Cocaine in India

In reply to Sir H ROBERTS, Mr CHAMBERLAIN (Secretary for India) wrote. Illicit traffic in cocaine continues to be a source of grave anxiety both to the Government of India and myself and stringent regulations on the subject have been framed. I cannot within the limits of a reply give these in detail, but I may say generally that imports are prohibited except under licence that private possession is punishable, and that sale to private persons by chemists and druggists is permitted only for medical purposes on the prescription of a qualified medical practitioner. The drug however, lends itself to smuggling by seamen and others in ways which defeat the best conceived regulations.

WEDNESDAY, AUGUST 9TH

Sanitary and Medical Arrangements in Mesopotamia

Sir JOHN JARDINE asked the Secretary of State for War (1) whether he could give an assurance that the river craft used for conveying troops up and down the River Tigris and the River Euphrates had proper appliances for securing that the drinking water should be uncontaminated and not dangerous to health, and (2) whether he was now able to assure the House that sufficient supplies of drugs, medicines, bandages, and other medical appliances had reached the troops at Basra, and in the stations on the lines of the Tigris and Euphrates.—Mr LLOYD GEORGE said in reply. My honourable friend asks me for two assurances but he will, I am sure, have taken into account that since the War Office assumed the additional responsibilities with which I dealt in the speech I made on July 20th no sufficient time has elapsed for an appreciable change to have been effected in the situation as a direct result of the change of responsibility. Subject to its being understood that the Army Council do not claim that all has yet been done which should be done and will be done I may inform him that, on all new boats ordered in the United Kingdom, arrangements for securing adequate proper drinking water have been made. Filtration barges are being sent and supply tanks on various points in the river will be provided. As regards the vessels already on the spot, I am informed that an installation for sterilising water recommended by the Director of Medical Services and the late Sir Victor Horsley, has already been provided on many ships and will be fitted to the remainder. Two tanks holding 40 gallons for cooling purposes have also been added on each vessel. A large number of hospital river steamers and barges have also been ordered. As regards drugs, medicines, bandages and other medical appliances all demands have been supplied, and as the General Officer Commanding has repeatedly been told to ask for all he wants I am satisfied that sufficient supplies are now available on the spot.

Appointments.

Successful applicants for vacancies Secretaries of Public Institutions and others possessing information suitable for this column are invited to forward to THE LANCET Office directed to the Sub-Editor not later than 9 o'clock on the Thursday morning of each week, such information for gratuitous publication.

BRADY S. L. M.R.C.S. L.R.C.P. Lond. has been appointed Ophthalmic House Surgeon at St. Thomas's Hospital.
CARLSON O. J. L.R.C.P. & S. Edin. L.F.P.S. Glasg. Certifying Surgeon under the Factory and Workshops Acts for the Ormskirk District of the county of Lancaster.
HAMILTON W. St. C. M.R.C.S. L.R.C.P. Lond. Casualty Officer and Resident Anaesthetist at St. Thomas's Hospital.
HEATON EDITH L.R.C.P. & S. Edin. L.R.F.P. & S. Glasg. Medical Officer to Munition Girls' Factory, Corringham, Essex.
McGROGAN T. M.D. Glasg. Certifying Surgeon under the Factory and Workshops Acts for the Girvan District of the county of Ayr.
MORE J. L.R.C.P. Lond. M.R.C.S. Certifying Surgeon under the Factory and Workshops Acts for the Rothwell District of the county of Northampton.
PETT A. I. M.B. B.C. Cantab. Certifying Surgeon under the Factory and Workshops Acts for the Longton District of the county of Lancaster.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index). When the application of a Belgian medical man would be considered the advertisement is referred to correspondents with the Editor.

BYECLIFF ST. PETER'S 1ST CYCLIST BRIGADE FIELD AMBULANCE.—Three Medical Officers.
CHARING CROSS HOSPITAL, W.C.—President Medical Officer. Salary a rate of £40 per annum with board &c.

CHESTERFIELD AND NORTH DERBYSHIRE HOSPITAL.—Second House Surgeon Salary £160 per annum with board &c
CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST Victoria Park E.—Resident Medical Officer Salary at rate of £200 per annum with board, &c
EVELING HOSPITAL FOR CHILDREN Southwark London, S E.—House Physician Salary at rate of £160 per annum with board &c
GREAT NORTHERN CENTRAL HOSPITAL, Holloway London N.—House Physician for six months Salary at rate of £100 per annum, with board &c
GUILDFORD ROYAL SURREY COUNTY HOSPITAL.—House Surgeon.
HOSPITAL OF ST JOHN AND ST ELIZABETH, 40, Grove End-road N W.—Resident Medical Officer unmarried for six months Salary at rate of £250 per annum with board, &c
HUDDERSFIELD COUNTY BOROUGH.—Assistant School Medical Officer Salary £300 per annum
LEEDS PUBLIC DISPENSARY.—Female Resident Medical Officer Salary £200 with board &c
LEEDS PUBLIC HEALTH DEPARTMENT.—Female Medical Assistant for Maternity and Child Welfare Work Salary £350 per annum
MACCLESFIELD GENERAL INFIRMARY.—Resident House Surgeon Salary £180 with board &c
MAIDSTONE WEST KENT GENERAL HOSPITAL.—Junior House Surgeon Salary £120 per annum with board, &c
MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN Park place, Cheetham Hill road.—Female House Surgeon Salary £120 per annum with board &c
MOUNT VERNON HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST Northwood Middlesex.—Resident Medical Officer Salary £120 per annum with board &c
NORTHAMPTON COUNTY BOROUGH.—School Medical Officer and Assistant Medical Officer of Health Salary £350 per annum rising to £400
NOTTS COUNTY COUNCIL.—Resident Medical Officer at the Ransom Sanatorium Sherwood Forest, Mansfield. Salary £250 per annum with board &c
QUEEN CHARLOTTE'S LYING-IN HOSPITAL Marylebone-road N W.—District Resident Medical Officer for four months Salary at rate of £60 per annum with board &c
QUEEN'S HOSPITAL FOR CHILDREN, Hackney road, Bethnal Green E.—Temporary Assistant Physician Also Temporary Assistant Surgeon Salary £25 per annum to cover travelling expenses
ST GEORGE'S HOSPITAL.—Resident Anaesthetist Salary at rate of £100 per annum
SHEFFIELD CHILDREN'S HOSPITAL Western Bank.—House Surgeon Salary £180 per annum with board &c
SHEFFIELD JESSOP HOSPITAL FOR WOMEN—Junior Female House Surgeon unmarried, for Gynaecological and Maternity Departments Salary £160 per annum with board &c
SOUTH LONDON HOSPITAL FOR WOMEN South Side Oliphant Common S W.—House Physician also House Surgeon for six months Salaries at rate of £100 per annum with board, &c Also Temporary Anaesthetists Honorarium 10s 6d per attendance
SUNDERLAND THE ROYAL INFIRMARY CHILDREN'S HOSPITAL.—Female Resident Medical Officer for six months Salary £100 per annum with board &c
TUNBRIDGE WELLS GENERAL HOSPITAL.—House Surgeon unmarried Salary £250 per annum with board &c
WILLESDEN URBAN DISTRICT COUNCIL HEALTH DEPARTMENT.—Temporary Assistant Medical Officer Salary £2 8s per week
WINCHESTER ROYAL HANTS COUNTY HOSPITAL.—Female Assistant to Resident Medical Officer Salary £100 per annum with board &c

Births, Marriages, and Deaths.

BIRTHS

BOLUS.—On July 28th, at Carlton road Weymouth the wife of Captain P R Bolus, M D R.A.M.C. of a son
GRAY.—On July 31st at Yew Tree Cottage West Malling the wife of Henry Gray M B C.S. of a daughter
GRIFFITH.—On July 31st, at Cavendish road St John's-wood N W to Helena and Harold Klader Griffith F.R.C.S. (Captain R.A.M.C.T.) a son
McDONALD.—On July 31st at Warrington-crescent Malda Vale N W to the wife of Lieutenant Colonel J H McDonald I.M.S.—a daughter

MARRIAGES

LOOSELY-WILLIAMS.—On August 2nd at the Hampstead Parish Church Alfred E A. Loosely, F.R.C.S. M.A. Oxon., to Belinda Veronica third daughter of the late Robert Williams and of Mrs Williams of Welldingborough

DEATHS

JALLAND.—In proud and loving memory of Lieutenant Stephen Jalland 5th East Yorks Regiment who was killed in action at Chocolate Hill Gallipoli on August 9th 1915 two days after the Suvla Bay landing
ROBERTS.—On August 2nd at Bath Elias Jones Roberts M B Lond M R C S E late District Medical Officer East Indian Railway Amsool India aged 94 years
SMALE.—On August 4th Morton Alfred Smale M R C S L.D.S. aged 69 years
WHOLEY.—On August 4th at Handcombe Lodge Pevensy after a long and painful illness Thomas Wholey M B the dearly loved husband of Agnes E Wholey aged 57 years

N B.—A fee of 5s is charged for the insertion of Notices of Births, Marriages and Deaths

SUN AND ELECTRIC LIGHT BATHS FOR PULMONARY TUBERCULOSIS

Dr W Holmboe's annual report of Mesnallien Sanatorium in Norway for the year 1915 (*Tidsskrift f d Norske Læger forening* Christiania, 1916, xxxvi 555) gives an account of the satisfactory progress made in the treatment of pulmonary tuberculosis by sun baths and electric light baths. From February to November most of the patients took sun baths for up to 4½ hours a day even when the temperature of the air was as low as 14° F. In no case was there any unfavourable result, in all instances the patients felt very much the better for the treatment, which was an excellent palliative in even the most advanced cases. In January and December at Mesnallien the sun is too low for sun bathing. Its place was taken by electric light bathing, 50 volt arc lamps are used (Dr Holmboe does not state the amperage) at a distance of half a metre from the patient's skin the exposures lasting up to two hours a day, though they would be longer if the electric supply were better. The immediate results of the electric light baths on the patients are identical with those of the sun baths, and leave nothing to be desired, the skin becomes bronzed or even chocolate coloured, and the patients feel vastly better. Sufficient experience has not yet been gained for any decision as to the effect of the electric light treatment on the pulmonary disease to be reached. During the year 115 patients were treated, artificial pneumothorax treatment was continued in 3 cases and attempted in 9 more, but failed in 3 of the 9. In one instance it was employed with success to stop a violent hæmoptysis. Extrapleural thoracoplastic operations were performed in 6 cases in which artificial pneumothorax treatment had failed partially or completely on account of pleural adhesions. In 3 patients the results of operation were completely satisfactory. 1 remains unfit for work, 1 died of marasmus some months later, and 1 died of pneumonia very soon after the operation. Dr Holmboe emphasises the importance of performing any such operations at a time when the patient is still relatively well and the general condition is still fairly good.

TATTIES

To the Editor of THE LANCET

SIR,—In reading the report of the sufferings from the heat of troops in transit in India recently I saw that ice and "tatties" are provided. The expression is also in your columns. What are "tatties"? The word is not in my dictionary. I am, Sir, yours faithfully

CALORIF

* The larger dictionaries define the word briefly. "The Oriental Interpreter" a work published many years ago, describes tatties as follows—

Tatties—screens made of the roots of *Justicia* a long grass which abounds in most of the jungles in India and which corresponds exactly with Guinea grass. The fibres are of a rusty brown colour, dense in their direction and may be from 10 to 20 inches in length. The frame in which this material is enclosed to form a screen is made of split bamboo cleaved into squares of about 4 inches each way and in the whole sufficiently extended to overlap the exterior of the door or window to which it is applied at least 6 inches or perhaps a foot at the sides and above. The *Justicia* is then placed very regularly on the bamboo frame as it lies on the ground in the same manner as tiles each layer being bound down under a thin slip of bamboo extending the full breadth of the tatty. The grass is so made the tatty neither too thick which would exclude the wind nor too thin as it would then let the dust pass through without rendering the interior sufficiently cool. In the Western Provinces and other parts of India tatties are frequently made of a short prickly bush that thrives during the hottest months on sandy plain, especially in places inundated during the rainy season. This is called *jeerasah*. Its leaves are not unlike but not so numerous nor so deep a green as those of rice. It is extremely prickly being everywhere furnished with spines about the size of a pin. The Europeans in India employ a *bheer* or water-carrier to saturate the tatties with water for their fragrance is then most powerfully elicited and the wind passing through them comes cool and discharged of the particles of dust it gathers on its course across the plains.—Ed L.

At an inquest held at Folham on August 5th a verdict of Manslaughter was returned against a music teacher practising hydropathy who had been attending a case of rheumatism which ended fatally.

THE SPELLING OF CINCHONA

To the Editor of THE LANCET

SIR—Many years ago I find that Sir R. Clements Markham, F.R.S., pleaded that this word should be spelt correctly as 'chinchona,' but common usage adhered to 'cinchona.' It was named from the Countess of Chinchon. Now the countess's name itself is corrupted by some modern lexicographers into 'Cinchona,' in order to tally with the corrupted botanical name. The cause of the confusion seems to be clearly explained in the following account which I have partly translated from Spanish from a South American source and amplified from other sources. The Count of Chinchon, Don Luis Fernandez de Cabrera, was Spanish Viceroy of Peru (1629-1639), and his wife Donna Ana de Ossorio (1576-1639), is celebrated as propagating the use of cinchona bark (she was cured of fever by it at Lima). When she returned to Spain she made known its qualities and Cardinal de Lugo carried it to Rome where it was called Lugo's powder and also 'the Countess's powder,' but the Italians wished to give it the name of the countess. Then arose a difficulty, as 'Chinchona' in Italian pronunciation would be kinkona, but 'cin' would be pronounced chin as in Spanish (and English). This gave in Italian the correct pronunciation of the first syllable but, of course, an erroneous spelling. Chinchon is a town in Spain 25 miles from Madrid. Sir Clements Markham explored Peru in the fifties* and in 1860 introduced cinchona culture from South America (where it began to be neglected) into India, which assured the regular supply.

Several dictionaries note with comment the deviation in the spelling, but I have not before seen an explanation of its cause. I am, Sir, yours faithfully,

London, August 4th, 1916

COMMUNICATIONS not noticed in our present issue will receive attention in our next

Medical Diary for the ensuing Week.

EDITORIAL NOTICES

It is most important that communications relating to the Editorial business of THE LANCET should be addressed exclusively "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub Editor."

Letters relating to the publication, sale and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

MANAGER'S NOTICES

THE INDEX AND TITLE-PAGE TO THE LANCET

January to June, 1916

In view of the Government restrictions upon the supply of paper, and the shortage of paper quite apart from these restrictions, the Index and the Title-page to the volume of THE LANCET which was completed with the issue of June 24th have been printed separately, and copies have been supplied gratis to those subscribers who have, up to August 10th, intimated to us their wish to receive them. Other subscribers will be similarly supplied, so long as the stock remains unexhausted, on application to the Manager, THE LANCET Office, 423, Strand, London W.C. Such application should please be sent in at once, direct to the Manager and not through Agents.

Volumes and Cases

VOLUMES for the first half of the year 1916 are now ready. Bound in cloth, gilt lettered, price 16s. carriage extra.

Cases for binding the half year's numbers are also ready. Cloth, gilt lettered, price 2s. by post 2s. 4d.

To be obtained on application to the Manager, accompanied by remittance.

TO SUBSCRIBERS

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423 Strand London W.C., are dealt with by them? Subscriptions paid to London or to local newsgents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and not to THE LANCET Offices.

Subscribers by sending their subscriptions direct to THE LANCET Offices will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

THE COLONIAL AND FOREIGN EDITION (printed on thin paper) is published in time to catch the weekly Friday mails to all parts of the world.

TO COLONIAL AND FOREIGN SUBSCRIBERS

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 4.

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

NEWSPAPERS FOR NEUTRAL COUNTRIES

Newspapers are not at present being sent forward to neutral European countries unless posted direct from the office of publishers or newsgents who have obtained permission from the War Office for this purpose. The Publisher of THE LANCET has obtained the required permission and he will forward copies direct from the Office to any neutral country on receipt of instructions.

ABSTRACTS OF

Garden Lectures

ON

RIVERS AS SOURCES OF WATER SUPPLY

Delivered before the Royal Institute of Public Health

By A C HOUSTON, M.B., C.M. EDIN., D.Sc.,
DIRECTOR OF WATER EXAMINATIONS METROPOLITAN WATER BOARD

LECTURE I

THE lecturer introduced the subject of his lectures in the following words — 'I make no apology for confining my remarks, almost exclusively to the particular river concerning which my ignorance is least. The river in question occupies a unique place in history, its beauties cannot be surpassed and it is the main source of water supply to the greatest city in the world. I refer, of course to the River Thames.'

THE RIVER THAMES

Slides were shown in illustration of the topography and geology of the Thames basin, and of the natural flow of the Thames over a 30 year period. The flow was shown to be highest in February and lowest in September. The intimate relation existing between the rainfall river flow and inverted barometric pressure was then considered.

A 29 year period (1891-1910) was then taken and the flow compared month by month with the rainfall. It was then shown that the heaviest rainfall was in October and the biggest flow of the river in February. Departures from the normal both as regards flow and rainfall, were dealt with and explanations were given of the 'lag' of the river behind the rainfall.

The 'surface' or immediate effects of rainfall were next considered and the first section concluded with evidence that curves representing the flow and temperature of the river show an inverse parallelism. Twelve lantern slides were shown in illustration of the points dealt with.

In the second section the chemical and bacteriological results at Pangbourne, Datchet and Hampton were carefully compared and the conclusion was reached that there was no serious difference in the hygienic quality of the river Thames at the three points. It was then pointed out that assuming this to be correct the greater availability of water in the lower reaches when the river is low but relatively pure might in itself turn the scale against the choice of upper river intakes. The lecturer explained that excepting Staines all the intakes of the Water Board were situated in the neighbourhood of Hampton and this was the site of collection of raw river water samples for analysis. Four lantern slides were shown to illustrate the various points raised in this section.

Early Result for 1906-13

In the third section the average yearly results as regards rainfall flow and chemical and bacteriological records over the eight-year period 1906-13 were dealt with at some length. Next the variations in the individual years were considered. It was pointed out that a wet year is almost necessarily a year of heavy flow of river unless there is some peculiarity in the seasonal distribution of the rainfall and a year of heavy flow is apt to be a bad quality year as judged at all events by some of the tests. Usually the curves representing the rainfall flow, permanganate turbidity and colour are in fair agreement but the ammoniacal nitrogen, albuminoid nitrogen, chlorine and oxidised nitrogen curves differ markedly from the flow curve. The bacteriological results are sometimes in agreement with the flow and sometimes the reverse.

The lecturer explained that the apparent discrepancies are due probably to the fact that the yearly flow is influenced not only by the total fall of rain in the year but by its seasonal distribution and periodicity and by the 'lag' of the river. Similarly the quality curves are influenced not only by the average flow throughout the year but by the manner in which the floods occur. It was pointed out that the relation between quality and flow is

best judged on a half yearly, quarterly, or monthly basis. Six lantern slides were shown in this section.

Half Yearly Results for 1906-14

In the fourth section, the half yearly results were considered in detail, over an eight-year period 1906-14. It was shown that there was not much difference between summer (April to September) and winter (October to March), as regards the albuminoid nitrogen test, but that the quality of the Thames was considerably worse during winter as judged by the following tests — Oxygen absorbed, turbidity, colour, gelatine count, agar count, bile salt agar count, and B. coli test.

The individual results were next dealt with and it was stated that the summer rainfall and flow of river of 1908 exceeded the winter rainfall and flow of river of 1908-09. The albuminoid nitrogen was higher in the summers of 1906, 1907, 1908 and 1911 than in the winters of 1906-07, 1907-08, 1908-09 and 1911-12. The oxygen absorbed from permanganate was higher in the summer of 1908 than in the winter of 1908-09. In all other cases the rainfall flow, albuminoid nitrogen and oxygen absorbed from permanganate results were the highest in winter. The turbidity and colour readings were always highest in winter and so were the number of bacteria and B. coli results.

The results as a whole show conclusively that the Thames is much less impure, as judged by these tests, in summer as compared with winter. The conclusion was reached that there is no tangible evidence of a progressive deterioration of the river Thames.

The lecturer then proceeded to answer the question 'Why is the Thames apparently purer in the summer than in the winter months?' He pointed out that during the winter the floods wash all sorts of impurities into the river, as, for example, from flooded sewage farms and storm sewage overflows. Moreover, the velocity of the river stirs up its bed and prevents the deposition of suspended matters. On the other hand in the summer much of the water in the river is derived from underground sources and is virtually stored and filtered water. Again the storm water sewage overflows which in flood time discharge unpurified or imperfectly purified filthy water into the river are no longer or less often in operation. Moreover many of the sewage farms may be practically dried up and the effluents may not be discharging directly into the river. These effluents may indirectly reach the river lower down but only after preliminary purification and mixture with underground water. Again the slow flow of the river no longer disturbs its bed, and any suspended matters in the water are constantly being deposited in the more stagnant reaches.

Four lantern slides were shown in illustration of the points dealt with.

Quarterly Results for 1906-13

In the fifth section the quarterly results over the period 1906-13 were considered first as averages and then in relation to the 32 quarters individually. It was indicated that the autumn and winter rains appear to dominate the winter and spring flow of the river. The albuminoid nitrogen curve is peculiar inasmuch as although it is at its highest in winter the spring fall is followed by a summer rise, and the lowest results are encountered in the autumn. The oxygen absorbed colour and turbidity curves follow the flow curve somewhat closely. The results are highest in the winter and lowest in the summer. There is no very striking difference between the spring and autumn results and in this respect they differ from the flow curve which is much higher in the spring than in the autumn. Having regard to the much greater volume of water in the river the spring quarter is obviously as judged by these three tests a better season for abstraction purposes than the autumn.

Next the bacteriological results were dealt with and it was pointed out that they agreed well with the flow curves. The results are worst in winter then in autumn next in spring and the summer quarter is the best. A striking feature is that although the results are somewhat worse in autumn than in spring the flow of the river is vastly greater in the spring as compared with the autumn.

Lastly the 32 quarters were dealt with individually as regards flow, albuminoid nitrogen, oxygen absorbed, colour, turbidity, bacterial counts and B. coli test. As regards the latter test it was indicated that the best results have

OF
RIVERS AS SOURCES OF WATER SUPPLY

Delivered before the Royal Institute of Public Health

By A C HOUSTON, M.B., C.M. EDIN., D.Sc.,
DIRECTOR OF WATER EXAMINATIONS METROPOLITAN WATER BOARD

LECTURE I

THE lecturer introduced the subject of his lectures in the following words — 'I make no apology for confining my remarks, almost exclusively, to the particular river concerning which my ignorance is least. The river in question occupies a unique place in history, its beauties cannot be surpassed and it is the main source of water supply to the greatest city in the world. I refer, of course to the River Thames.'

THE RIVER THAMES

Slides were shown in illustration of the topography and geology of the Thames basin, and of the natural flow of the Thames over a 30 year period. The flow was shown to be highest in February and lowest in September. The intimate relation existing between the rainfall, river flow and inverted barometric pressure was then considered.

A 20 year period (1891-1910) was then taken and the flow compared month by month with the rainfall. It was then shown that the heaviest rainfall was in October and the biggest flow of the river in February. Departures from the normal both as regards flow and rainfall were dealt with and explanations were given of the 'lag' of the river behind the rainfall.

The 'surface' or 'immediate' effects of rainfall were next considered and the first section concluded with evidence that curves representing the flow and temperature of the river show an inverse parallelism. Twelve lantern slides were shown in illustration of the points dealt with.

In the second section the chemical and bacteriological results at Pangbourne, Datchet, and Hampton were carefully compared and the conclusion was reached that there was no serious difference in the hygienic quality of the river Thames at these three points. It was then pointed out that, assuming this to be correct, the greater availability of water in the lower reaches when the river is low but relatively pure might in itself turn the scale against the choice of upper river intakes. The lecturer explained that excepting Staines, all the intakes of the Water Board were situated in the neighbourhood of Hampton and this was the site of collection of raw river water samples for analysis. Four lantern slides were shown to illustrate the various points raised in this section.

Yearly Results for 1906-13

In the third section the average yearly results as regards rainfall, flow and chemical and bacteriological records over the eight-year period 1906-13 were dealt with at some length. Next the variations in the individual years were considered. It was pointed out that a wet year is almost necessarily a year of heavy flow of river unless there is some peculiarity in the seasonal distribution of the rainfall and a year of heavy flow is apt to be a bad quality year as judged at all events by some of the tests. Usually the curves representing the rainfall, flow, permanganate, turbidity and colour tests are in fair agreement but the ammoniacal nitrogen, albuminoid nitrogen, chlorine and oxidised nitrogen curves differ markedly from the flow curve. The bacteriological results are sometimes in agreement with the flow and some times the reverse.

The lecturer explained that the apparent discrepancies are due probably to the fact that the yearly flow is influenced not only by the total fall of rain in the year but by its seasonal distribution and periodicity and by the 'lag' of the river. Similarly the quality curves are influenced not only by the average flow throughout the year but by the manner for example in which the floods occur. It was pointed out that the relation between quality and flow is

best judged on a half yearly, quarterly or monthly basis. Six lantern slides were shown in this section.

Half Yearly Results for 1906-14

In the fourth section, the half yearly results were considered in detail, over an eight-year period 1906-14. It was shown that there was not much difference between summer (April to September) and winter (October to March), as regards the albuminoid nitrogen test, but that the quality of the Thames was considerably worse during winter, as judged by the following tests — Oxygen absorbed, turbidity, colour, gelatine count, agar count, bile salt agar count, and B. coli test.

The individual results were next dealt with and it was stated that the summer rainfall and flow of river of 1908 exceeded the winter rainfall and flow of river of 1908-09. The albuminoid nitrogen was higher in the summers of 1906, 1907, 1908 and 1911 than in the winters of 1906-07, 1907-08, 1908-09, and 1911-12. The oxygen absorbed from permanganate was higher in the summer of 1908 than in the winter of 1908-09. In all other cases the rainfall, flow, albuminoid nitrogen and oxygen absorbed from permanganate results were the highest in winter. The turbidity and colour readings were always highest in winter and so were the number of bacteria and B. coli results.

The results as a whole show conclusively that the Thames is much less impure, as judged by these tests, in summer as compared with winter. The conclusion was reached that there is no tangible evidence of a progressive deterioration of the river Thames.

The lecturer then proceeded to answer the question 'Why is the Thames apparently purer in the summer than in the winter months?' He pointed out that during the winter the floods wash all sorts of impurities into the river, as, for example, from flooded sewage farms and storm sewage overflows. Moreover, the velocity of the river stirs up its bed and prevents the deposition of suspended matters. On the other hand in the summer much of the water in the river is derived from underground sources and is virtually stored and filtered water. Again the storm water sewage overflows which in flood time discharge unpurified or imperfectly purified filthy water into the river are no longer or less often in operation. Moreover many of the sewage farms may be practically dried up and the effluents may not be discharging directly into the river. These effluents may indirectly reach the river lower down but only after preliminary purification and mixture with underground water. Again the slow flow of the river no longer disturbs its bed and any suspended matters in the water are constantly being deposited in the more stagnant reaches.

Four lantern slides were shown in illustration of the points dealt with.

Quarterly Results for 1906-13

In the fifth section the quarterly results over the period 1906-13 were considered first as averages and then in relation to the 32 quarters individually. It was indicated that the autumn and winter rains appear to dominate the winter and spring flow of the river. The albuminoid nitrogen curve is peculiar, inasmuch as although it is at its highest in winter the spring fall is followed by a summer rise, and the lowest results are encountered in the autumn. The oxygen absorbed, colour and turbidity curves follow the flow curve somewhat closely. The results are highest in the winter and lowest in the summer. There is no very striking difference between the spring and autumn results and in this respect they differ from the flow curve which is much higher in the spring than in the autumn. Having regard to the much greater volume of water in the river the spring quarter is obviously as judged by these three tests a better season for abstraction purposes than the autumn.

Next the bacteriological results were dealt with and it was pointed out that they agreed well with the flow curves. The results are worst in winter, then in autumn next in spring and the summer quarter is the best. A striking feature is that although the results are somewhat worse in autumn than in spring the flow of the river is vastly greater in the spring as compared with the autumn.

Lastly the 32 quarters were dealt with individually as regards flow, albuminoid nitrogen, oxygen absorbed, colour, turbidity, bacterial counts and B. coli test. As regards the latter test, it was indicated that the best results have

invariably been in the summer quarter. The section was copiously illustrated by means of 10 lantern slides.

Monthly Results

In the sixth section the monthly results, as regards rainfall, flow and chemical and bacteriological records, were considered at great length. It was shown that the ammoniacal nitrogen curve agrees fairly well with the flow, but it reaches its minimum in May, whereas the flow reaches its minimum in September. The albuminoid nitrogen curve does not agree very well with the flow curve. The oxygen absorbed, turbidity, and colour curves agree very well with each other and with the flow curve. The results are lowest in September and highest in December. Curves representing the flow, gelatine, agar, and bile salt agar counts and the B coli test are in broad agreement with each other although they also exhibit certain points of dissimilarity. The B coli results are practically the same in January and December, whereas the gelatine, agar and bile salt agar counts are much worse in the latter month. Considering all the results together May would seem to be the best month of the year. The drop in the agar and bile salt agar counts in February is very striking.

The lecturer then dealt with the bacteriological tests separately. As regards the gelatine counts the best months are May, June, July, and September. In April, although the flow is still above the average the number of bacteria is 35.4 per cent below its average. In October and November the flow of the river is still below the average, whereas the gelatine count is almost up to the average in October and 57.7 above the average in November. December is far the worst month of the year.

The agar and bile salt agar curves were shown to follow each other very closely. The best results occur in May a rise occurs in June and a slight fall in July, another rise is seen in August, and September shows another fall. The abrupt rise in October is far in advance of the rise in the flow of the river. The results are much the worst during December.

As regards the B coli results, these are very nearly the same in December and January. In April the results are 13.43 per cent better than the average although the flow still remains slightly above the average (2.6 per cent). There is not much difference between the May and September results, although July is slightly the best month. After September the results deteriorate more rapidly than the flow of the river increases.

The lecturer then showed, in relation to the flow, combined chemical and combined bacteriological curves, and pointed out that they fall at the beginning of the year much more rapidly than the flow curve. Conversely, they rise much more rapidly than the flow curve at the end of the year. In other words improvement in quality precedes decreased flow, and deterioration takes place in advance of increased flow. Having regard to the large volume of water still flowing in the river in April and May, the chemical and bacteriological results are very satisfactory from a water works point of view.

It was next pointed out that during the winter months there is a frequent oscillation of the flow and quality curves produced by the more or less immediate or surface effects of the heavy rain although this does not affect the fact that the general curves of quality and flow are dominated by the rainfall of a much earlier period.

No fewer than 15 lantern slides were shown in illustration of this section.

LECTURE II

THAMES WATER IN RELATION TO PATHOGENIC BACTERIA

Dr Houston in his seventh section showed that, as judged by the streptococcus test Thames water did not contain 1 part of fresh excremental matter in over 22 million parts of water. From this he proceeded to consider the question of the possible presence of the typhoid bacillus and Gartner's bacillus in river water. Excepting two typhoid like microbes and one Gartner like microbe, all his elaborate researches, involving the study of over 22,000 microbes yielded negative results. Dr Houston found that on the average he could count on the isolation of the typhoid bacillus and Gartner's bacillus from artificially infected samples of river water where these microbes were present in the proportion of 1 per 9 c.c. and 1 per 19 c.c. respectively. His failure to find these bacteria in otherwise comparable but non infected

samples led him to conclude that these microbes cannot be present in river water in the proportion first stated. Seeing that it can easily be proved by the B coli test that the river water is improved over 1000 times by the purification processes employed, the lecturer concluded that these pathogenic bacteria could not be present in the water as supplied to consumers in the proportion of 1 per 9000 and 1 per 19,000 c.c. respectively.

Dr Houston showed microphotographs of the two typhoid like bacteria and the Gartner like microbe, and he then proceeded to show that by the bacteriological examination of sewage we could determine the status of any water supply as regards the number of cubic centimetres presumably free from the typhoid bacillus. Briefly, by comparing infected (with known numbers of typhoid bacilli) with non infected samples of sewage, the conclusion was reached that the typhoid bacillus cannot be present in 0.00066 c.c. of sewage which contains 704 excremental bacteria. The figure of 704 thus becomes the criterion figure for judging the probable specific qualities of water supplies. For if 0.00066 c.c. of sewage contains no typhoid bacilli, then whatever volume of any water supply, containing no more than 704 excremental bacteria, cannot reasonably be supposed to harbour the typhoid bacillus in that volume. For example the Thames contains 704 excremental bacteria in 15 c.c., and as the water is purified 1000 times as judged by the B coli test the inference is that the typhoid bacillus is not present in 15 litres of the water as supplied to consumers.

"RESISTANCE TO FILTRATION"

In his eighth section the lecturer dealt with the "resistance to filtration" of Thames water and the microscopical appearances of its suspended matter. By resistance to filtration is meant the degree to which the suspended matters (living and dead) in a water interfere with its filtration by "blocking" the filtering material. Having explained the means adopted for testing this point an ingenious method was next described of obtaining permanent qualitative and quantitative photographic records of the suspended matter in the water.

It appears that raw Thames water filters fairly well on the average but in the spring and winter the results may be widely different. Photographs were first exhibited showing that during summer the water filters well, owing to the comparative absence of suspended matter. Next some winter "flood" results were shown and the change in appearance was so striking as easily to explain the wide difference in the observed filtration results. Then the spring results were illustrated, and here, apparently we have to deal with algal growths as well as with amorphous organic and inorganic matters.

STORAGE OF RIVER WATER PREVIOUS TO FILTRATION

In his ninth section Dr Houston described some of his now well known researches on the vitality of the cholera vibrio and the typhoid bacillus when artificially added to river water in enormous numbers. He concluded that storage was inimical to the prolonged vitality of these pathogenic bacteria and he drew an important distinction between "cultivated" and "uncultivated" microbes. It appears that the latter die much more speedily than the former in river water under conditions of storage.

Next in his tenth section the lecturer summarised his prolonged researches on the advantages of storing river water in reservoirs antecedent to filtration. Taking the Chelsea reservoir as an example Dr Houston explained that the percentage reduction (due to storage) in the gelatine agar and bile salt agar count was about 95, 84 and 88 respectively. As judged by the B coli test the water was improved at least 100 times. For example 48.3 per cent of the samples of river water yielded positive results with 0.1 c.c. of water whereas only 32.5 per cent samples of stored water yielded positive results with 100 times as much water—namely, 10 c.c.

Dealt with as actual figures the gelatine count was reduced from 4465 to 203 the agar count from 257 to 47 and the bile salt agar count from 41 to 5. Chemically the reductions effected by storage were as follows—

Ammoniacal nitrogen	63.1 per cent
Albuminoid	29.1
Permanganate test	27.8
Turbidity	8.9
Colour	45.8

Turning next to the Staines and Lambeth reservoir results, it was pointed out that the river water before storage contained B coli in 0.1 c.c. (or less) in 53.2 per cent of the samples examined. After storage in the Staines reservoirs about the same number (56 per cent) of samples yielded positive results with 100 times as much water—namely 10 c.c. The Lambeth (Island Barn) results were not quite so good but were still very striking.

The percentage reduction in the bacterial counts were as follows—

	Staines	Lambeth
Gelatine count	57 per cent	89 per cent
Agar count	64 "	64 "
Bile salt agar count	91 "	86 "

The percentage reduction in the chemical results consequent upon storage were—

	Staines	Lambeth
Ammoniacal nitrogen	18.6 per cent	29.3 per cent
Albuminoid nitrogen	6.12 "	Slight apparent increase
Permanganate test	27.5 "	17.7 per cent
Turbidity	66.4 "	75.1 "
Colour	45.2 "	42.1 "

The percentage number of samples in the case of other reservoirs, yielding positive results with 1 c.c. (or less) of water as judged by the B coli test was as follows—

River Thames	95.0 per cent
Walton reservoir	22.6 "
West Middlesex No 1 Reservoir	35.2 "
" " " 3 "	35.3 "
" " " 4 "	39.4 "
" " " 6 "	45.4 "
Sunbury reservoir	54.9 "
Grand Junction (Hampton) reservoir	19.5 "
" (Kew) "	33.4 "
Kempton Park	13.0 "

Conclusions in regard to Storage of River Water

The lecturer's conclusions (under this section) were as follows—

1 Storage reduces the number of bacteria of all sorts the number of bacteria capable of growing on agar at blood heat and the number of bacteria capable of growing in a bile-salt medium at blood heat chiefly excremental bacteria.

2 Storage reduces the number of coli like microbes and the number of typical B coli.

3 Storage may alter certain bacteriological river water ratios, for example it may reduce the number of typical B coli to a proportionately greater extent than it reduces the number of bacteria of all sorts.

4 Storage if sufficiently prolonged devitalises the microbes of water borne disease (e.g., the typhoid bacillus and the cholera vibrio).

5 Storage reduces the amount of suspended matter colour ammoniacal nitrogen, and oxygen absorbed from permanganate.

6 Storage usually reduces the hardness and may reduce (or alter the quality of) the albuminoid nitrogen.

7 Storage alters certain chemical water ratios, for example the colour results improve more than the results yielded by the permanganate test.

8 Storage has a marked 'levelling' effect on the totality of water delivered to the filter beds.

9 Storage tends generally to lengthen the life of the filter* (Only under exceptional conditions is the converse true.)

10 An adequately stored water is to be regarded as a 'safe' water and the 'safety charge' which has occurred in a stored water can be recognised by appropriate tests.

11 The use of stored water enables a constant check to be maintained on the safety of London's water an accident to and irrespective of filtration.

12 The use of stored water goes far to neutralise or wipe out the gravity of any charge that a water supply is derived from polluted sources.

13 The use of adequately stored water renders any accidental breakdown in the filtering arrangements much less serious than might otherwise be the case.

The lecture was most copiously illustrated with lantern slides.

LECTURE III

TESTING THE "RESISTANCE TO FILTRATION"

In his third and final lecture Dr Houston showed, for the benefit of those not previously present, the methods adopted for testing the 'resistance to filtration' shown by various waters, and also the method of obtaining quantitative and qualitative photographic records of the suspended matters present in such waters.

Briefly, 100 c.c. of the sample of water are filtered through four thicknesses of a standard linen tightly bound round the end of a piece of glass tubing, so that the whole of the suspended matters remain as a thin film on the inside of the linen. Tap water (which is practically free from suspended matter) is then filtered, under a constant head, through the linen and the filtrate collected for one minute and then measured. If the original water contains very little suspended matter the skin on the linen is so thin that 200-300 c.c. pass through it in the minute. On the other hand if the original water contains a great deal of suspended matter the skin on the linen is so thick and impervious that very little, or none, of the tap water passes through it. To correlate the 'resistance to filtration' results with the appearance of the suspended matter present the lecturer described at some length his methods for obtaining permanent qualitative and quantitative photographic records.

Dr Houston showed that tap water gave an average 'resistance to filtration' figure of 281, and this is to be regarded as the criterion figure for judging all other results. The River Thames gives an average of 112 and shows marked seasonal fluctuations.

PHYSICAL AND BIOLOGICAL CHANGES IN RIVER WATER UNDER STORAGE

Turning next to the physical and biological changes occurring in river water under conditions of storage, the lecturer showed that reservoirs like the Walton and Obelsea give excellent averages (249 and 228 respectively), and the results are wonderfully uniform throughout the year. In explanation of these figures a series of photographic slides were shown and it was made apparent that the high filtration figures were due to these reservoirs being relatively free from algal, or other growths, and suspended matters in general.

The Lambeth (Island Barn) reservoir results were next dealt with and here the average filtration figure was low and the fluctuations during the year very considerable. Beautiful photographs were shown in explanation of the results observed. It was shown that the 'falling off' in the results was due to the development of algal and other growths (e.g., *Fragillaria*, *Asterionella*, *Ceratium*, *Tabellaria* (c.)).

Then the Staines reservoir results were considered and their importance may be judged by the fact that this is the source of supply to the Sunbury, Kempton Park, Grand Junction (Hampton and Kew) and West Middlesex works. The average results were not very satisfactory and in August and September 1915 and March, 1916, the filtration figures showed a marked falling off. A series of striking photographs was shown indicating the reasons for these changes. It appears that in August and September the chief offender was *Fragillaria*, and in March, *Asterionella* was mostly to blame.

All the reservoirs supplied with Staines water were then considered in detail as regards filtration results. The Sunbury, Grand Junction (Hampton) Grand Junction (Kew), and West Middlesex reservoirs all gave wonderfully similar results: the average filtration figures varying from 102 to 168 as compared with 249 in the case of the Walton reservoirs. The pattern of the various curves shown as slides was also very similar, the results being specially unsatisfactory about August and September, 1915, and again in March, 1916. A large number of photographs was shown in explanation of the 'falling off' in the filtration results, and it was made abundantly clear that in summer *Fragillaria* and in spring *Asterionella* were the chief causes of the trouble.

In concluding the section (Section 11) the lecturer dealt with the question of how far laboratory filtration results could be used to pre-judge actual sand filtration experiences. Although many factors some but little understood, have to be taken note of in this connection Dr Houston was able to show by means of slides that sometimes the number of acres of sand

cleaned at the works agreed almost exactly with the laboratory filtration results the former curve being, of course, inverted. The inference seems to be that by the periodical examination of reservoir water the life of the sand filters can be judged with tolerable accuracy.

ALGAL-INFECTED WATERS

The next section (No. 12) was devoted to the treatment of algal infected waters with copper sulphate. It was pointed out that the dose required to kill the different organisms varied within very wide limits. The maximum dose is hardly permissible, and with smaller doses there is always the chance of the way being paved for the active development of more resistant forms. Utilising this line of thought, the lecturer, for purposes of illustration conjectured the possibility of in a partial sense, a series of doses of copper sulphate leading to the growth of widely different organisms. To give point to his meaning, Dr Houston showed a most beautiful series of slides in the following order: *Uroglana*, *Asterionella*, *Anabaena*, and *Synura*, *Spirogyra* and *Oscillaria*, *Fragillaria* and *Volvox*, *Dinobryon*, *Synedra*, and, finally, *Ceratium*. As Dr Houston remarked, when you interfere with the balance of nature you can never be quite sure of the ultimate consequences.

Subject to the treatment being carried out by experts, the lecturer, however, was not opposed to the judicious use of copper sulphate as an algicide. Apart from sentiment it may be a sound financial proposition to anticipate algal troubles by an inhibitory dose of copper sulphate as this may mean prolonging the life of the filter beds very considerably. Apparently copper sulphate is a better algicidal than bactericidal agent, the converse holding true with the hypochlorites.

In Section 13 the lecturer dealt with the taste of algal infected water. The descriptions given to these tastes and odours by scientists (e.g., geranium, mossy, cucumber, grassy, violet nasturtium, &c.) carry small conviction to the consumer, who is apt to use more forcible expressions—e.g., like castor oil or rotten fish. *Asterionella*, *Cyclotella*, *Anabaena*, *Oscillaria*, *Dinobryon*, *Volvox*, *Uroglana*, and *Synura*, are but a few of the growths which have been credited with the production of evil tastes. A beautiful slide of *Tabellaria* was shown, and it was stated that the geranium like taste produced by this growth could be successfully overcome by a small dose of potassium permanganate (5 lbs. per million gallons). Hypochlorites, in comparison, are of little use as "taste removers."

FILTRATION—WATER AND DISEASE

Having dealt in previous sections with the River Thames from the physical, chemical, and bacteriological points of view and with the changes which occur in it consequent upon storage the lecturer proceeded (in Section 14) to consider the effect of the last stage in the purification process (namely, filtration) on the quality of water finally delivered to consumers.

The works supplying Thames derived filtered water are the following: Sanbury, Kempton Park, Grand Junction (Hampton and Kew), Southwark and Vauxhall, Lambeth, Chelsea and West Middlesex. For the 10 year period 1906-16 the average bacterial "count" per cubic centimetre in the raw river water was—

Gelatine	2900,	reduced to 14.8	over 99% reduction
Agar	248	" "	" 2.8 "
Bile salt agar	28	" "	" 0.5 " 93% "

As regards the B. coli test over the same period it appears that only 21.2 per cent of the samples of filtered water contained B. coli in 100 c.c. only 5.7 per cent in 10 c.c. and only 0.9 per cent in 1 c.c. The raw river water contained B. coli in 0.1 c.c. in 50.2 per cent of the samples examined so that the conclusion is obvious that as judged by this test the river water is purified over 1000 times before delivery to consumers.

The actual chemical results and percentage reductions were as under—

Ammoniacal nitrogen	0.0069 to 0.0003	(95.6 per cent)
Albuminoid	0.0155 "	0.0051 (60.6 ")
Permanganate test	0.2099	0.0846 (59.6 ")
Colour test	71	19 (73.2 ")

Dealing with the quarterly results the lecturer showed that the gelatine agar and bile-salt agar counts were highest in the filtered water in summer and lowest in

winter. This was ascribed not so much to more rapid filtration during the months of maximum consumption but rather to the effect of temperature. The B. coli yielded the worst results in winter and the best during the spring.

In his last section (Section 15) Dr Houston dealt with question of water in its relation to disease. Charts shown proving that deterioration of the supply as judged by the more important tests "lags" a long way behind autumnal rise in the incidence of typhoid fever.

CONCLUSION

The lecturer concluded with the following remarks—

"You are all aware that a Joint Select Committee of Houses of Parliament (1910) endorsed the recommendation of the Water supply Commission of 1869, as to the appropriation of sources, the Metropolitan Water supply Commissions of 1893 and 1899, as to the keeping of suitable reservoirs by water undertakers, and of the Sewage Disposal Commission as to the formation of rivers or watershed boards controlled by a central administrative authority.

They recommended the establishment of such a central administrative authority as was contemplated by the International Commission on Sewage Disposal and the division of country into watershed areas, and the appointment for each area of local representative boards, who, subject to guidance and control of the central authority should secure systematic and continuous inquiries into the supply of their jurisdiction take all necessary measures to husband such supplies, both surface and subsoil, secure their preservation from pollution, and advise on allocation for sanitary, industrial, and other purposes.

Visualising the future, I foresee that a vast amount of work has yet to be done on water supply. In these three lectures I have endeavoured to present, as faithfully as possible, an aspect of this great problem—namely, the question of rivers as sources of water supply.

In conclusion I still hold, as a counsel of perfection, the purest water supply is the supply that requires no purification. But this is not inconsistent with the view that rivers by adequate means, can be purified to any standard of safety required."

OBSERVATIONS ON THE EFFECT OF THE ADDITION OF FRESH HUMAN BLOOD SERUM TO ARTIFICIAL MEDIA

By LEONARD S. DUDGEON, F.R.C.P. LOND.

LIEUTENANT-COLONEL, R.A.M.C. (TEMP.) CONSULTING BACTERIOLOGIST TO THE EXPEDITIONARY FORCE, SALONICA. MEMBER OF ADVISORY COMMITTEE ON EPIDEMIC DISEASE AND SANITATION, W.E.F.

F. BAWTREE, M.R.C.S., L.R.C.P. LOND.

AND

DUDLEY CORBETT, M.A., M.D. OXON., M.R.C.P. LOND.

(From the Department of Pathology, St. Thomas's Hospital.)

It has long been recognised that the ordinary media which are employed for the cultivation of bacteria outside the tissues are not ideal and it is for this reason that a body fluid is often added to various media to stimulate growth. The disadvantage of this method is due to the fact that the body fluid is usually subjected to the action of heat in the preparation of the media thus reducing some of its active properties during the process of sterilisation. In the case of many of the ordinary pyogenic bacteria such as the streptococci and the pneumococci there may be a comparatively feeble growth in many of the media which are employed while experience has shown that in some of the most active infective processes due to streptococci the original growth of the organism outside the body is often extremely limited at a time when it is most essential to obtain an active growth of the cocci. During the period when one of us (L.S.D.) was engaged in studying the so-called aggressive exudate from the tissues it was noticed that in some instances an abundant growth of streptococci was obtained when an exudate was added to the ordinary media in comparative

large amounts while an extremely limited growth was obtained in those media inoculated without the addition of a body fluid. Further it was proved that the addition of the unheated body fluid was the cause of the abundant growth and not the massive inoculation of the media, although some exudates had not this stimulating action on bacterial activity.

Human blood serum was obtained for the preparation of culture media from healthy adults and from others who came to the laboratories for various purposes. As far as we are aware, there is no difference in the nutritive value of the serum from a patient suffering from pernicious anemia and that of a strong over-fed man while the amount of serum obtained is much greater from the case of severe anemia. Whether normal serum however, has any special advantages for the growth of bacteria will be proved with greater experience of this method of cultivation.

Method of collecting human blood serum.—We employ special needles for the purpose which have the advantage of a wide bore, giving a rapid flow of blood, and a sharp edge which easily passes through the toughest skin into the vein. To the distal end of the needle is attached a piece of rubber tubing some 3 or 4 inches long, and the whole is enclosed in a test-tube sterilised by dry heat. The blood is collected from a vein at the bend of the elbow which is made prominent in the usual way and an amount from 40–100 c.c. is collected in large sterile test-tubes. The whole process takes very little time, and in our experience contamination has not occurred, although we cannot claim to employ any special method of skin sterilisation but carefully avoid touching the active portion of the apparatus or the patient's skin except with sterile instruments. After the blood is collected it is allowed to clot in the ice safe, and the serum to settle which is merely a question of a few hours although varying according to circumstances to which we need not refer here. Blood collected in the morning will give a large bulk of clear serum free from red cells by the afternoon. This serum is then drawn up in quantities varying from 2–3 c.c. in glass tubing drawn out and sterilised in the flame at one end and the same time always employing a long barretted tube for the purpose. Human serum, owing to its weight falls to the bottom of the tubes of fluid media, and it is here that the massive growth of bacteria is obtained. For the preparation of solid media the serum is added to the agar at the lowest possible temperature and then converted into fresh serum agar slopes or plated as required.

No experiments were made with animal serum, as we were able to obtain ample quantities of fresh human serum every morning without any trouble and it was always sterile. In a big hospital human serum is much more readily obtained than the serum from large animals as quite apart from both in patients and on patients whose blood requires examination students and others are generally benefited by a little blood-letting. We also used both sterile ascitic and pleuritic sera, but these appear to mix more intimately with the liquid media because of their lighter specific gravity when compared with that of blood serum which always falls to the bottom of the tube and there acts as the stimulating property of the medium. From the experiences which we have had with sera other than blood sera it would seem that with these there is less inhibitory action on the growth of non-pathogenic bacteria than occurs with the unheated blood serum. This in itself if proved to be correct is a point strongly in favour of blood serum. The addition of fresh ascitic fluid or hydrocele fluid or even human serum to melted agar as a medium for the growth of such bacteria as the gonococcus and meningococcus has long been the practice of certain bacteriologists while fresh human or animal serum smeared over the surface of agar is another type of medium activated by the addition of fresh animal juices. We consider that the introduction of fresh human serum to the carbohydrate media produces the most satisfactory medium for the growth of such bacteria as streptococci, pneumococci, meningococci and gonococci—that is those bacteria which require something more than is usually supplied outside the tissue. Such organisms as the meningococcus are able to live in carbohydrate media for relatively long periods if human blood serum has been added as is

described elsewhere in this communication. Further, the morphological and cultural characteristics of such an easily cultivated organism as the diphtheria bacillus are considerably altered by growing it in various carbohydrate media containing fresh human serum.

A. The Effect of the Addition of Fresh Human Blood Serum to Artificial Media upon the Growth of Bacteria

The most notable effect of the addition of fresh serum is that upon the amount of growth produced. Whether the serum is added to liquid carbohydrate media or whether it is incorporated with agar according to the method described above the amount of growth in actual visible bulk is considerably greater than can be obtained with any other medium available. This effect is particularly striking in the case of those organisms which by the ordinary cultural methods grow but feebly such as some strains of streptococci and pneumococci, the meningococcus and the gonococcus. It may be mentioned at this point that where it is subsequently stated that "no growth" has occurred in any liquid medium we mean no obvious growth to the naked eye whether as a deposit at the bottom of the tube, adherent to the sides, or suspended in the medium. Films were only made in those cases where it was of considerable importance to discover a trace of growth.

Streptococci.—The favourable influence of fresh serum is best shown when a streptococcus is grown in the sugar media, particularly in the case of dextrose. The deposit in the tube to which serum has been added is frequently enormous and composed of large flocculent masses while that in the control tube is much finer in consistence and far less in actual bulk. Advantage may be taken of this mass of growth in the preparation of a vaccine. If the deposit is washed in saline and emulsified it will form a perfectly homogeneous emulsion free from clumps and in density equal to an emulsion prepared from a 24-hour agar culture of bacillus coli using the same volume of saline in each case.

Pneumococci.—The effect is no less striking in the case of the pneumococcus. Although the amount produced in the sugar media in 24 hours may not be so great as is the case with some strains of streptococci, yet it is always far greater than in those tubes to which serum has not been added. If a subculture on to nasagar produces only a scanty growth or fails entirely a fine growth of large colonies may be obtained if the fresh serum agar is employed.

Meningococci.—All the strains tested were isolated directly from the cerebro-spinal fluid of cases of cerebro-spinal fever. The most favourable media for this organism were found to be dextrose with fresh serum and the fresh serum agar. In the former an enormous deposit is obtained in 48–72 hours, and in the latter a fine crop of large colonies. When subcultures on nasagar fail the fresh serum agar will frequently show abundant growth.

Gonococci.—Three strains of this organism were examined. 1. Cultures from the urethra were made directly on to three red cell agars, one tube of nasagar and one of fresh serum dextrose. At the end of four days incubation all were sterile except the fresh serum dextrose which showed an abundant growth of the gonococcus. Subcultures were then taken from the latter on to red cell agar and fresh serum agar. No growth took place on the red cell agar but was abundant on the fresh serum agar.

2. In this case the urine was full of pus and a portion of the deposit was put directly upon red cell agar, fresh serum agar and fresh serum dextrose. The red-cell agar proved sterile whereas growth was abundant in the other two media.

3. A swab from the urethra was inoculated into fresh serum dextrose. A good growth was obtained at the end of 48 hours in which an organism resembling the gonococcus was predominant. The deposit was plated on a fresh serum agar plate and numerous colonies of the gonococcus were obtained.

Diphtheria

The growth and morphology of the diphtheria bacillus in fresh serum media are best considered under one heading.

If we refer to the standard work on the diphtheria bacillus by Nuttall and Graham Smith we find certain remarks on the morphological features of this organism to

* We consider this method of obtaining blood to be the most reliable and the most efficient which we have employed during our experience of bacterial work.

* The Bacillus of Diphtheria. Nuttall and Graham Smith. Cambridge University Press, 1914.

which we must refer. It might be as well to mention at the outset that the diphtheria bacillus grows abundantly in many of the carbohydrate media containing fresh human blood serum, but more especially in the presence of dextrose. It is also our experience that if the bacillus grows on inspissated blood serum it will also grow, and grow well, in the serum media to which we have referred. The morphological characters may be absolutely distinct if grown in various carbohydrate media to which the serum has been added, and, further, the morphology will be quite distinct in *litmus* dextrose containing fresh human serum compared with that on inspissated blood serum, although the bacillus may be growing equally well in each case. Further, a diphtheria bacillus which has certain typical characteristics when grown on blood serum will give equally distinctive characteristics in one of the sugar media containing blood serum, while the original morphological appearances can be restored in the next subculture back on to blood serum or *vice versa*. Such alterations are produced by growing the organism for 24 hours at 37°C and then making the transfer and again incubating for another 24 hours and repeating as required for the purpose.

The abundance of growth in the fresh serum media as compared with that in the simple carbohydrate media and the greater metabolic activity of the organism are very definitely emphasised, but of course these points have been to some extent recorded previously by Graham Smith and others in their experiments with Hiss's serum-water media to which the carbohydrates had been added, although this is a medium which is subjected to heat for the purpose of sterilisation. Williams⁴ in 1902 found out the value of a medium known as ascitic broth, which consisted of broth to which 25 per cent ascitic fluid had been added. In this medium he found that the diphtheria bacillus grew abundantly and produced a high degree of toxicity. Other workers who are quoted by Nuttall and Graham Smith employed a medium of human serum broth containing 10 per cent of the serum.

1 *Growth and acid production in the sugar media*.—Of 12 strains examined 4 were put through the following media with and without fresh serum. Dextrose or maltose, lactose, cane sugar, mannite. Of the plain media without serum, dextrose or maltose was readily acidified, lactose slightly after 48 hours on three occasions, cane sugar once slightly after 72 hours, but mannite never. The corresponding media to which blood serum was added were all acidified in periods varying from 24–72 hours, mannite being the least affected, while the growth in every case was much more extensive than in the plain carbohydrate media.⁵

2 *Growth on fresh serum agar*.—This was found to be a particularly favourable and convenient medium for the cultivation of the diphtheria bacillus, especially for plating out a mixed culture. In this respect it is far superior to ordinary nasagar. The throat swab from one case was plated direct on two plates, one of nasagar and another of fresh serum agar. Only staphylococci grew on the former, while on the latter together with the cocci were masses of diphtheria colonies showing organisms of the beaded type. Another case gave an abundant growth of the diphtheria bacillus on each plate, but on the fresh serum agar the growth was purer and the individual bacilli were larger and showed a more typical arrangement. The characters of the colonies growing on this medium are distinct, being large, grey, and moist, and tending to be confluent.

3 *The influence exercised by fresh serum upon the growth of the diphtheria bacillus as opposed to other organisms present in the throat swab*.—Six swabs were taken from cases of clinical diphtheria and put direct into fresh serum maltose and on to inspissated blood serum. Where diphtheria bacilli were present in the liquid medium they were also present on the solid and the proportions in each case were about equal. The fresh serum maltose favoured the growth of streptococci and diplococci while the proportion of staphylococci was greater on the solid blood serum.

4 *The effect of liquid fresh serum media upon the morphology of the diphtheria bacillus*.—This effect was most remarkable and is best illustrated by quoting examples from each case examined.

Case 1.—In fresh serum dextrose were found bacilli of the striped form. In fresh serum lactose they were chiefly of the short form and many of the Hoffmann type while in fresh serum mannite they were of the typical long type with clubs.

Case 3.—On blood serum were the long and clubbed formations while in the fresh serum dextrose the bacilli were long and swollen in the middle, and similar shapes only were seen in the fresh serum mannite.

Case 6.—On blood serum the bacilli were long and beaded, and many typical club shapes were present, while on fresh serum agar they were of the thin type with very few clubs. In fresh serum dextrose the bacilli formed characteristic clumps, while the individual organisms were short, oval in shape, with pointed ends. A few long forms were seen, but these were rare. In fresh serum cane sugar there were typical clumps of beaded bacilli of a very thin type. No oval forms were seen nor did any of the bacilli present resemble those seen in the fresh serum dextrose.

We have, then, from the use of these culture media four different aspects of the morphology of this organism all grown from the same strain: the club shape, the long beaded, the very fine thin type, and that resembling Hoffmann's bacillus.

Summary.—The value of fresh serum in the cultivation of the diphtheria bacillus would appear to be (1) its addition to ordinary agar for plating purposes, (2) its use in the production of a liquid medium most favourable to the growth of the organism, and (3) in affording a means of studying its very variable morphology. The precise significance of Hoffmann's bacillus is at present undetermined, at any rate, it cannot be said with absolute certainty that morphologically it is an organism quite distinct from the diphtheria bacillus. It has been shown that the presence of fresh serum will cause certain sugars to be acidified by the growth of the diphtheria bacillus, upon which it would otherwise have no action, and that its morphology is profoundly altered under certain conditions.

Staphylococci.—A similar influence is exercised by fresh serum upon the amount of growth produced in the sugar media by the staphylococcus aureus, although not to such a notable extent, this organism growing readily enough without serum. The albus variety has not so far been specially investigated.

B The Presence of Fresh Serum Encourages Growth where Culture on Other Media Fails

We have considered the amount of growth produced in media to which serum has been added, and it may now be of interest to consider instances where the presence of fresh serum encourages growth where culture on other media fails. We have already seen instances of this point in the case of gonococci and meningococci and there are many other examples in the case of the pneumococci and streptococci.

Pneumococci.—(1) Growth was obtained in lactose, but not in raffinose, salicin, or inulin. The addition of fresh serum, however, produced abundant growth in these media, all being inoculated from the same source and at the same time.

(2) A pneumococcus was obtained from a blood culture and was growing fairly well on nasagar. Subcultures were made from this into dextrose, raffinose, salicin, mannite and inulin, with and without fresh serum. With the exception of inulin, no obvious growth took place even after three days in the plain media but was abundant in 24 hours in all those to which fresh serum had been added. There was a slight growth in the inulin although the medium was unaltered while the fresh serum inulin was acidified and clotted. After passage through a mouse it acidified and grew in plain dextrose and raffinose but still did not clot the heated serum inulin. We shall return later to the effect of fresh serum upon the metabolic characters of both pneumococci and streptococci.

Streptococci.—(1) A streptococcus isolated from a wound was subcultured into dextrose salicin and inulin with and without fresh serum. Growth occurred in all the serum tubes in 24 hours but in the plain media there was none at the end of 48 hours.

(2) A streptococcus was isolated from a case of ulcerated endocarditis. It grew slightly without acid formation in plain dextrose after 48 hours, but not in raffinose salicin.

⁴ A. Williams quoted by Nuttall and Graham-Smith, 1905, p. 175.
⁵ The considerable acidity produced by the growth of the bacillus in dextrose with human blood serum may considerably affect the pathogenicity of the organism.

or mannite. In similar media with fresh serum there was abundant growth with acid production in 24 hours.

(iii.) A streptococcus could not be induced to grow in subculture upon nasgar although a fair growth could be obtained on a similar medium to which red cells had been added. It was inoculated into fresh serum dextrose and an abundant growth was obtained in 24 hours, and subcultures were made from this into dextrose salicin, mannite, and cane-sugar with and without fresh serum. There was growth in the plain cane sugar in 48 hours but in none of the others without serum. In all the serum tubes there was ample growth in 24-48 hours.

Numerous other examples were met with, where growth would only occur in the dextrose or maltose without serum but where there would be growth in all the media inoculated to which serum had been added.

Not only does the presence of fresh serum increase the amount of growth of the streptococci and pneumococci in pure culture, but there is a distinct tendency for it to encourage the growth of these organisms in subcultures from pus and sputum where staphylococci are also present. If a swab infected with staphylococci and streptococci be inoculated into two tubes one containing dextrose and the other fresh serum dextrose, the latter will show a very large growth of streptococci with few staphylococci, while the plain dextrose may contain staphylococci only, or the two organisms in about equal numbers depending no doubt upon the character of the streptococcus in question. It is however, a rapid and easy method of getting a considerable growth of a streptococcus where there is a mixed infection.

Further, if we are dealing with a sputum from a case of suspected pneumococcal infection it is a useful plan to put it straight into fresh serum dextrose. If pneumococci are present in the sputum this medium will grow them in large numbers, and perfect examples of capsule formation may be capable of demonstration. A streptococcus of the salivarius type is nearly always present in association, but can be separated by subsequent plating if desired.

C The Presence of Fresh Serum Stimulates the Growth of Pathogenic Organisms as Opposed to Non-pathogenic During the First 24-48 Hours at 57° C

The following is an example of the value of the fresh serum media in this respect. A sputum in which pneumococci were present in very large numbers was inoculated into inulin and raffinose with and without fresh serum. Both the serum media showed practically a pure culture of pneumococcus, whereas the plain tubes grew other organisms as well. Plates made from the raffinose showed a limited growth of the pneumococcus and numerous other colonies, whereas those made from the raffinose serum tube gave a pure culture of the causal organism.

Further experience has led us to adopt a similar plan for the isolation of the causal organism when taking a swab from the throat, nasopharynx, tooth socket or other infected focus likely to be contaminated with air organisms and led us to use the method in cases of suspected diphtheria. The following is an interesting example of the inhibitory influence exercised by fresh serum. Dextrose and fresh-serum dextrose were inoculated from a tube of heated blood serum upon which suspected diphtheria bacilli were growing from a throat swab. In 24 hours the dextrose tube showed a few diphtheria bacilli but very large numbers of yeast organisms while in the serum tubes no yeast could be seen, but typical diphtheria bacilli were abundant. This culture was plated on fresh serum agar and subcultures on to inspissated blood serum and in each case a pure growth of *B. diphtherie* was obtained. In another 24 hours however, large numbers of yeast organisms whose growth had hitherto been inhibited by the presence of the fresh serum were present in the tubes of fresh serum dextrose.

D The Length of Life at 57° C of Organisms Growing in Carbohydrate Media to which Fresh Serum has been added

The organisms specially tested in this respect were four strains of the meningococcus, all isolated from the cerebro-spinal fluid of cases of cerebro-spinal fever, one of micrococcus catarrhalis and two of the gonococcus. Fresh serum dextrose was the medium employed and subcultures were made from the deposit of the original tube at weekly intervals. No fresh supply of serum was added afterwards.

Meningococcus.—1 Lived for eight weeks in one tube of this medium. Subculture on to nasgar failed after four

weeks but good growth was obtained on fresh serum agar for the remainder of the period.

2 Lived for six weeks. Subcultures on to nasgar were successful to the end, no further growth being observed on fresh serum agar.

3 Lived for three weeks. Subcultures grew on nasgar, no further growth on the fresh medium.

4 Was kept in the following media, to which serum had been added—maltose, lactose, raffinose, and mannite. Maltose was acidified but the others were alkaline. Subcultures to nasgar succeeded only for three weeks. At the end of four weeks subculture from the serum maltose failed on fresh serum agar, but the other cultures gave abundant growth on this medium after five weeks especially the serum mannite which was still alkaline. These cultures are still under observation. Possibly the absence of acidity favours the life of this organism.

M. catarrhalis.—This organism lived seven weeks, and subcultures were obtained to the end on nasgar.

Gonococcus.—1 Was alive after 12 days, but dead in 17 days. Abundant growth was observed on fresh serum agar, while those on red-cell agar were sterile. 2. Lived for one week.

E The Effect on Morphology

In the case of the streptococci the invariable effect of the presence of fresh serum in the carbohydrate media is to encourage longer chain formation, and the individual cocci are larger and stain better. On the other hand, with the pneumococci the diplococcal arrangement is favoured as against the streptococcal and well marked capsule formation may occur. A strain obtained from an empyema grew in all the plain sugar media as a typical streptococcus but as a diplococcus in all those to which fresh serum had been added. It would seem therefore, that fresh serum by providing an environment suitable to vigorous growth of an organism causes it to display its proper morphological characters. Its influence upon the morphology of the diphtheria bacillus has already been described.

F The Effect of the Addition of Fresh Human Serum to Artificial Carbohydrate Media upon the Action of Organisms on these Media

The only action of bacteria upon artificial carbohydrate media which has been studied is the acid production. It may be stated at the outset that the addition of fresh serum has no effect one way or the other upon gas production as far as we can estimate from the experience at hand. Speaking generally this addition to the media will not only stimulate the growth of organisms as has already been shown but will cause them to acidify those media upon which otherwise they would have no effect. These two actions usually run *pari passu* but by no means always. By the use of litmus media throughout it is possible to see very clearly and with reasonable accuracy the amount of acid that has been produced in a given time.

It is possible to have abundant growth without any visible acid production, this occurs chiefly in the case of certain strains of streptococcus growing in fresh serum mannite. We can also have all degrees of acid production in the various media. Faint acidity is illustrated by a red tinge at the bottom of the tube, when stronger the whole of the medium is red, and when the acidity is still more marked the medium will gradually become decolourised. Decolourisation of the medium may also occur without any visible acid production. This happens sometimes in serum mannite with some strains of streptococci and pneumococci. It also occurred with the Shiga bacillus which decolourised serum raffinose, cane sugar and dulcitol.

The streptococci.—Thirty four strains were studied, no attempt having been made to group the cases in any way but simply to make a statement of the reactions obtained. The sugar media employed were dextrose, raffinose, salicin, mannite, inulin and sometimes maltose in the place of dextrose if no tubes of the latter happened to be available at the moment. Milk was only used occasionally because it was not considered a suitable medium with which to

* At six weeks the serum mannite became contaminated, but the organism remained alive for one week longer in fresh-serum lactose making seven weeks of life altogether. Two more strains have since been tested for length of life: one lived six weeks and the other six weeks in fresh serum dextrose.

† Two other strains have since been examined: one lived 19 days in fresh-serum dextrose and the other 10 days on fresh-serum agar.

compare the effect of the addition of fresh serum. The inulin employed was Hiss's heated serum inulin.

The addition of fresh human serum to these media before inoculation had the effect of very considerably increasing the capacity of the streptococcus under examination to ferment them. There were many examples where none of the plain media were acted upon by the organism, but where all

Table showing the Effect of Fresh Serum upon the Fermentation Tests

Medium	Streptococci, 34 strains		Pneumococci, 13 varieties	
	Acidified percent	No of times medium used	Acidified percent	No of times medium used
Dextrose	77	27	81	11
+ Normal serum	100		100

+ Normal serum	36		57*	
Inulin	18	16	10	10
+ Normal serum ..	31		100	

* Decolourised

similar media with fresh serum were acidified. A complete record of such results necessitated the keeping of extensive tables, for we have recorded growth as well as acidification and the number of hours in which they have appeared. Since no attempt has been made at classification we have thought it best to summarise the results in the accompanying table, the point being to demonstrate the effect of fresh serum upon the fermentation reactions.

Dextrose would appear to be the most favourable medium in this series (see table). Maltose was used 12 times and was acidified in every case, but with one exception a similar result was obtained with dextrose, so it is not included in the table. Salicin, an important medium to those who place reliance on the fermentation tests, was only acidified 8 times out of 34 strains examined, while in every case save one (that of a urinary streptococcus) there was acid production when fresh serum was added. None of the strains tested, including those isolated from wounds and two from feces, acidified mannite alone, but the fresh serum mannite was acidified 11 times out of 30 and decolourised once. The favourable influence of the fresh serum was least marked in the case of inulin. In two cases however, its addition caused abundant growth with clot formation where no change occurred in the control tubes without fresh serum.

The fermentation results may also be shown graphically in the accompanying curves.

Pneumococci—Thirteen varieties of this organism were tested and the results are expressed in a similar manner (See table). The numbers tested are insufficient to enable one strictly to compare the results obtained with those among the streptococci. So far as they go they agree in the case of dextrose, and also very closely in the case of salicin both with and without fresh serum, the effect of the addition of fresh serum being strongly marked with the latter medium. There is a fair difference with raffinose, but the fresh serum inulin was acidified in every case thereby not only differing from the results obtained with the streptococci in this medium, but also demonstrating in a very clear manner its value as a suitable medium for the pneumococcus since Hiss's heated serum inulin was only fermented once and then only when it was inoculated with a definite volume

of pus. One strain grew in all the sugars without serum as a streptococcus, but in all those with fresh serum as a typical pneumococcus. In one instance all media were inoculated with a definite volume of pus, here the results obtained from the media with and without serum more closely corresponded than in any other instance owing to the presence of serum in the pus.

Staphylococci—The fresh serum makes very little difference to the fermentation reactions of the staphylococcus aureus: the ordinary sugars being acidified with great readiness but when grown in fresh serum salicin there is frequently an inhibition of acidity compared with the plain salicin although the growth may be considerable and autolysis marked.

The Effect of Culture in Fresh Serum upon the Variability of Streptococci and Pneumococci towards the Fermentation Tests

Ainley Walker^a showed that the continual culture of streptococci in various media for periods up to two years had the effect of altering their behaviour to some of the fermentation reactions, and he obtains a similar result after successive passages through a mouse. He concludes as a result of his observations that the fermentation reactions are largely dependent upon the environment in which the organisms have been growing.

Our results tend to confirm these conclusions since growth in a fresh serum medium in so short a period as 24 hours completely altered the fermentation reactions in those cases where this point was tested. We have only recognised this fact recently, so that the evidence is not extensive although so very definite and unmistakable that one is led to the conclusion that further experiments in this direction can only confirm our present results.

Streptococci—1. A subculture from nasar neither grew in nor acidified salicin in 48 hours. The same organism after subculture in fresh undiluted human serum grew freely in this medium with abundant acid production in 24 hours. The other reactions remained the same.

2. This was isolated from a case of ulcerative endocarditis

CURVE 1—Streptococci, 34 strains

CURVE 2—Pneumococci, 13 strains

Fermentation of carbohydrate media with and without fresh serum. Dotted lines represent fresh-serum media; a solid line represents plain media.

In this and in subsequent subcultures abundant growth occurred in all the fresh serum carbohydrate media, and acid was produced in all but fresh serum mannite. On the other hand there was considerable variation in the fermentation of the plain carbohydrate media in three subcultures. Fir-

subculture from *agar* Salicin acidified, dextrose, raffinose and mannite unaffected. Two of the fresh serum media were chosen from which to make subcultures. The fresh-serum salicin showed vigorous chain formation and the individual cocci stained perfectly, while the growth in the fresh serum mannite, though abundant, showed considerable autolysis. Second subcultures from *fresh serum salicin* Raffinose and salicin acidified dextrose and mannite showed no change. Third subculture from *fresh serum mannite* Dextrose acidified, salicin, raffinose and mannite unchanged.

Pneumococci—1. Isolated from an empyema. The pneumococcus while growing freely in the fresh serum media did not acidify salicin but a subculture from fresh serum salicin readily acidified the plain medium.

2 An example of variability after animal passage. Isolated from a blood culture, it had no effect on dextrose, raffinose, salicin mannite or inulin, but in the fresh serum media it was growing strongly and the fresh serum inulin was clotted. This culture was passed through a mouse, and the pneumococcus isolated from the heart blood acidified dextrose and raffinose, but still had no effect on salicin and no more effect on the heated serum inulin than on the first occasion.

It is reasonable to suppose, therefore, that cultures in fresh serum media will be proved to have an effect upon the variability both of streptococci and pneumococci equal to if not more than that effected by animal passage, and it would be an interesting point to compare the two with the same organism.

The general inference is that the addition of fresh serum to carbohydrate media, although in itself possessing a potential alkalinity, so favours the growth of streptococci and pneumococci as to enable them to acidify those carbohydrates in which they appear to produce little effect in the absence of serum. It would seem that this influence cannot be merely due to the physical properties of the serum preventing the diffusion of the inhibitory carbohydrate medium among the growing organisms, nor can it be ascribed to the protein content or the reaction of the serum, because such influence is not similarly exerted by heated serum, as shown by Hiss's heated serum inulin.

It might be suggested that the presence of dextrose in normal fresh serum might account for the acid production, but in the first place it is in very small amount (0.1 per cent.) and the acid production is out of all proportion to the quantity present and again, fermentation does not always occur in the fresh serum media as it should if the dextrose in the serum were responsible for the effect. We must assume, therefore, that there is some fresh principle akin to the vitamins which is necessary to vigorous growth in the case of these organisms and that there is some connexion between vigorous growth and the capacity to ferment certain carbohydrates although there is nothing at present to prove that such connexion is absolute or direct.

It is not our intention to make any attempt to enter into the controversy as to the value or reliability of Gordon's fermentation tests in affording a means of classification of the streptococci but rather to suggest that the employment of fresh serum media may assist in solving the problem of their variability. If it is to be assumed according to Gordon's with the modifications suggested by Andrews and Horder that there are certain fixed types or predominant groups of streptococci connected by a number of variants then the culture with fresh serum may do away with the large number of such variants which have hitherto obscured any sharp distinctions between the types variants which may possibly be due to the vigour of the growth under examination. If on the other hand the hypothesis stated by Ainslie Walker is on the evidence of his own experiments and those of others is correct—namely that there is only one streptococcus pathogenic to man and that the difference in the power of certain strains to ferment any given carbohydrate is due to the adaptation to a particular previous environment—then the presence of fresh serum may also eliminate finer cultural distinctions by providing an environment which as our experiments show is the most favourable hitherto obtained under artificial conditions.

Summary

The addition of normal fresh human blood serum to artificial media in the culture of micro-organisms has the following effects—

1. It provides a most favourable medium for growth where culture under artificial conditions may otherwise fail.
2. It greatly increases the amount of growth in those media to which it has been added compared to those prepared without it.
3. It stimulates the growth of pathogenic organisms as opposed to non pathogenic.
4. It prolongs the life of organisms which are prone to die out under artificial conditions as shown in the case of the meningococcus.
5. It greatly facilitates the culture of the diphtheria bacillus and in its combination with different media helps to illustrate all aspects of the morphology of this organism.
6. It exercises considerable influence upon other organisms of variable morphology tending in the case of the pneumococci to reproduce the true type as found in the body fluids.
7. It profoundly alters the fermentation reactions of the streptococci and pneumococci, tending to obliterate the finer differences between types or the differences due to particular environment.

THREE CASES OF ENTAMOEBA HISTOLYTICA INFECTION TREATED WITH EMETINE BISMUTH IODIDE

By GEORGE C. LOW, M.A. ST. AND, M.D. EDIN.

ASSISTANT PHYSICIAN AND LECTURER, LONDON SCHOOL OF TROPICAL MEDICINE

AND

CLIFFORD DOBELL, M.A.

LECTURER IN PROTOZOOLOGY, IMPERIAL COLLEGE OF SCIENCE.

(Report to the Medical Research Committee)

IN THE LANCET of July 29th last, Dr. H. H. Dale has called attention to the fact that emetine hydrochloride given subcutaneously fails to effect a complete cure in a number of cases of intestinal amebiasis. He emphasises the fact that after treatment some patients cease, for a time, to pass cysts and then relapse and become chronic carriers of *Entamoeba histolytica*, while in others prolonged treatment with the usual 1-grain dose given daily for 12 days in succession fails entirely to arrest the passage of cysts. American workers and others have also noted this, and lately Mr. Geoffrey Paget and Mr. Redman King have specially drawn attention to it in soldiers treated in the Graylingwell Military Hospital at Chichester. In some of these, however, apparently successful results have been obtained by the subsequent employment of a new emetine compound emetine bismuth iodide. Dr. Dale narrates some of these successes in his paper and owing to his kindness we have been able to employ the new compound in the treatment of a series of patients suffering from entamoebiasis. Three of these are of special interest, as they represent different types of entamoebic infection, and two of them had never been previously treated with emetine. The details of these three individuals are as follows.

CASE 1—*Acute amebic dysentery*

HISTORY—The patient, a native was born in Bombay and had spent most of his life at sea. As regards previous illnesses he stated that he had always been healthy, never having had anything important the matter with himself before. Was quite well when the ship on which he was working left Bombay. Shortly after this however he developed a severe pain in the abdomen with looseness of the bowels. This was followed by severe purging 12 to 15 stools a day and gradually became worse, so when the ship arrived in London he was sent into the Seamen's Hospital at the Millia where treatment was adopted no emetine having been administered.

Examination—Clinically the case was typical of acute entamoebic dysentery, the stools consisting of nothing but shreds of mucous membrane with blood and small sloughs. Microscopic examination revealed the presence of many typical acute amebae. *Entamoeba histolytica*. Pressure over

the colon elicited great pain and tenderness, this being most marked over the region of the sigmoid. There was no rise of temperature, the patient was thin, but not emaciated, his other systems were normal.

Treatment—This was begun at once on July 6th, 3 grains of emetine bismuth iodide being administered that evening. This caused no discomfort or sickness. A similar dose was given next night, and so on until 12 had been taken consecutively. The amœbæ disappeared rapidly, none being found after the third dose, and all blood and mucus had disappeared after the fourth. Towards the end of the treatment a distinct diarrhoea appeared, but this was disregarded. It improved a few days after the last dose, and up to the time of writing this paper the patient has convalesced in the usual manner. Table I shows the results of the treatment at a glance.

CASE 2 Convalescent carrier of long standing

History—The patient, an Englishman went to India in 1898 and left there in 1909. His health on the whole was good. He suffered from malaria at times, had enteric in 1906, had dysentery in 1908, and becoming neurasthenic after that was sent home the following year and did not return. From that time till 1914 he kept more or less fit, but he several times had looseness of the bowels and some distinct abdominal discomfort. On Dec 25th 1914, he got a chill, and with this a return of pain and tenderness in the abdomen and slight irregularity of the bowels. An examination of the stools at the London School of Tropical Medicine was made and encysted amœbæ, E histolytica, were found. A course of emetine was prescribed one injection every day for a fortnight (dose probably $\frac{1}{2}$ or $\frac{3}{4}$ a grain), and the cysts then were said to have disappeared. During the summer of 1915 he was not well, and towards the autumn had pain again and signs of dysentery, three or four stools a day with a considerable amount of mucus. He was not on a strict diet, and was taking alcohol.

Examination—He was first seen by one of us on Dec 20th, 1915, and then presented nothing specially abnormal, no pain or tenderness over the colon, and no cysts in the stools. He was put on a strict diet and all alcohol was stopped. Further examinations of the stools during January and February, 1916, showed no abnormalities, but in July, as he was not feeling well a further search demonstrated the presence of E histolytica cysts again. At this time he complained chiefly of what he described as gnawing pains in the abdomen, but there was no diarrhoea, the stools as a rule being one a day only. They were of a somewhat soft consistency, of an ordinary colour, and did not look in any way abnormal.

Treatment—This was begun on July 19th, 3 grains of the emetine bismuth iodide being administered on that evening and subsequently until 12 consecutive doses had been administered. In this instance the drug was not very well borne, as a rule the patient vomiting every night after the administration. This was not violent, however, and he was able to take his breakfast next morning as usual. Cysts disappeared after the fourth dose. A certain degree of diarrhoea was present after the seventh dose, but not of sufficient amount to interfere seriously with the treatment. Table II shows the results of the treatment.

CASE 3—Contact carrier case

History—The patient was an Englishman who had never been out of Europe. This is a specially interesting case as the subject only discovered accidentally that he was passing E histolytica cysts, and never at any time had had signs of dysentery, diarrhoea, or other irregularity of the bowels. He came to learn the routine methods of examination of human faeces for protozoa with one of us (C D), and upon examining his own faeces about three months later discovered what he believed to be cysts of E histolytica. He therefore brought these to one of us (C D), who verified the diagnosis. It is not certain where he acquired his infection, but everything points to his having picked it up in the laboratory whilst engaged in examining stools containing cysts of E histolytica. This is the more likely as it is now five years since he was out of England. Previously to this he had visited Italy (northern), the Riviera, Switzerland and the south west of France—places where amœbic dysentery as far as we are aware, is not endemic.

Examination—Apart from a suspicion of tenderness over the transverse colon, there was nothing of interest to note. There was no raised temperature, no pain over the liver and the stools were normal. Cysts could not always be found in the faeces.

Treatment—Treatment was begun on the evening of June 14th, emetine bismuth iodide, grains III being given. Though causing no actual vomiting, the drug disagreed with him causing nausea and diarrhoea. Subsequent doses on the 15th, 16th, 17th, and 18th increased these symptoms to such an extent that the treatment had then to be abandoned. The cysts disappeared from the stools after the fourth dose and have not been found since. Table III shows the results of the treatment and stool examinations.

E. hist cysts	+	+	+	+	+	+	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-			

E = Emetine bismuth iodide grs III +++ = Positive result, small infection. ++ = Moderate infection. + = Negative result.

It may be noted here that the three cases just described all appear to be cases of infection with Entamoeba histolytica alone. No other protozoa have been found in any of them.

If one studies the histories of these three cases it will be seen that this new emetine compound given by the mouth has been equally efficient to emetine by the needle, or to the old ipecacuanha treatment in the case of acute dysentery reported (Case 1). The amœbæ disappeared rapidly as did also the blood and mucus, together with the pain and other symptoms. Whether or not a complete sterilisation has been effected can only be determined by prolonged examinations conducted over a long period of time, but, unfortunately, this will not be possible in this case, as the man eventually will have to return to his ship and go abroad again.

Case 2 is just the type of case that one expects to do badly when treated by the ordinary 1 grain doses of emetine subcutaneously. It is now over seven years since the patient acquired his infection and during that time treatment with comparatively small doses of emetine had been employed, a procedure which apparently tends to produce a resistant strain of amœbæ with the subsequent passage of cysts. The emetine bismuth iodide quickly got rid of his cysts, and though it is too early to say yet whether this disappearance is permanent, from what one learns in other cases the result is distinctly hopeful. Of course one cannot say that, in this instance, emetine subcutaneously in the ordinary way would not have produced the same effect. That it can do so in some instances is undoubted as two cases published by one of us in the *Journal of Tropical Medicine and Hygiene* (Feb 1st 1916) have now been free from cysts, the one for one year and two months the other for over six months after one course of treatment with 1 grain doses of emetine hydrochloride subcutaneously on 12 successive days.

Others have studied cases for shorter periods of time than these with similar results, but there are nevertheless many other cases known—some of them to us personally—where emetine injected subcutaneously has failed to make any

difference to the passage of cysts at all. It is for these cases that a new form of treatment is required.

Case 3 probably had little ulceration and had only a small infection, but even granting this, only five 3-grain doses of the new compound seem to have completely sterilised him, no cysts having been found now for six weeks. It is, of course, possible that emetine administered hypodermically in this case also might have produced an equally satisfactory result. Nevertheless we may note that two other similar contact carriers who came under the observation of one of us failed to get rid of their infections after repeated 1 grain injections of emetine hydrochloride hypodermically (One of these had 13, the other 14 grains of emetine altogether).

It is possible that in carriers the amoebae are living in pockets in the bowel, as Dr Dale suggests and that the emetine when injected never reaches them. This is certainly borne out by the fact that the exhibition of the drug by the mouth—either the whole drug, ipecacuanha, as advised by American workers, or the new compound emetine bismuth iodide—seems to clear cases quickly which have resisted all attempts by the needle.

One point brought out by the cases we have treated so far is that this new emetine compound produces much more disagreeable symptoms than emetine hydrochloride given by the needle. Some of these recall to one's memory the old ipecacuanha days, though the symptoms after administration of the double iodide are in many cases far less severe. Sickness is fairly common, many of the patients feeling distinctly unwell during and immediately after their treatment while others are purged. But it must be remembered that the latter is not uncommon even when the needle is employed.

So far the drug has been given in a single dose of 3 grains—thus representing a little more than 1 grain of emetine—once a day in the evenings with the last meal and never on an empty stomach, as was customary with ipecacuanha. The reason for this is indicated in Dr Dale's paper already quoted. It was thought that it might be better to administer the drug three times a day in 1 grain doses, but in some cases in which this treatment has been tried the results so far as they have yet been ascertained, do not seem to have been appreciably different from those just described. When practicable it is best to keep the patient in bed during treatment. In cases where much sickness is produced it might be expedient to diminish the daily dose, but as this might also diminish the efficacy of the treatment it is clearly better that the patient should temporarily suffer than that his amoebae should permanently persist.

In one of our patients (No. 3) the drug had to be stopped after five doses had been given and we have now a letter from another patient saying that five doses have so upset him—nausea, vomiting and diarrhoea—that he cannot continue the treatment. We describe these symptoms because we think them important but on the other hand it is only fair to say that many people can take the full course of 36 grains with no untoward results. The removal of the amoebae and their cysts is however so much more important for the patient—not to mention the public at large—than the temporary inconvenience that this removal may cause him that too much emphasis should not be laid upon what has been after all the only drawback in our experience to the use of the drug.

Evidence derived from our own cases together with that adduced by Dr Dale has convinced us that emetine bismuth iodide is far more efficacious than emetine hydrochloride given hypodermically in removing the cysts from the faces of chronic carriers and in our opinion it should henceforward be generally employed in such cases—at all events until a more ideal treatment is forthcoming.

TUBERCULOSIS AND THE WORKING MAN—We learn from the *Daily Telegraph* that an important decision was reached by the High Court of Foresters at Cheltenham last week. After a long discussion it was decided that members receiving benefit whilst suffering from tuberculosis might with special consent of the court do open air work prescribed for them by a medical practitioner. Some delegates expressed their anxieties the order might result in the exploitation of sweating. The experiment will be watched with keen interest by all those interested in the after-care of tuberculous patients.

THE INTRAVENOUS INJECTION OF OXYGEN GAS AS A THERAPEUTIC MEASURE

BY F W TUNNICLIFFE, M D LOND.,
PHYSICIAN KING'S COLLEGE HOSPITAL LECTURER ON THERAPEUTICS
KING'S COLLEGE HOSPITAL MEDICAL SCHOOL

AND

G F STEBBING, M B, B S LOND.,
ASSISTANT MEDICAL OFFICER, LAMBETH INFIRMARY

FOR some time it has been the practice of one of us (Tunncliffe) when using saline venous injections, either simple nutrient (glucose and lecithin) or medicated, to use not simple saline solution but oxygenated saline solution. We are quite aware that the quantity of oxygen introduced by this method is very small as compared with the oxygen requirement of the subject, nevertheless cyanosis is rapidly alleviated by the use of such solutions and we have observed that more rapid and generally better results are also produced by such (oxygenated) solutions *qua* their nutrient and medicinal content than by similar solutions, the basis of which is simple physiological saline solution. These results are of course, in accord with those obtained in perfusion experiments in the laboratory. Several months ago when one of us (Tunncliffe) was talking this matter over with Dr F S Locke we were made aware of the interesting fact that when pure oxygen gas is introduced directly into the veins of animals the latter do not necessarily succumb to gas embolism.

Our interest in this matter was further stimulated by reading the accounts of the respiratory phenomena following the inhalation of the poisonous gas to which our soldiers have been exposed in the present war. We understand that in these cases the inhalation of oxygen is both difficult and relatively inefficient. Difficult because of the constant cough and expectoration, inefficient, because of the copious secretion present in the pulmonary bronchioles and alveoli. Apart from these cases, the occurrence of which is now to a great extent happily prevented by the use of appropriate helmets there must occur to clinicians instances in which the relief by the intravenous injection of oxygen of an acute cyanosis either unrelieved or from the nature of the case impossible to relieve by the inhalation of the gas might be of very considerable therapeutic value. These considerations and the results we had already observed from the intravenous injection of saline solutions holding necessarily relatively small quantities of oxygen in solution encouraged us to hope that we should be able, without risk to the patient to introduce into the veins a quantity of oxygen gas sufficient to exert a definite therapeutic effect and thus both to relieve a cyanosis already present and to prevent its occurrence under conditions which would otherwise produce it.

Earlier Investigations

Oxygen gas was discovered by Priestley in 1775 and as early as 1811 Nyssen¹ made a most interesting series of experiments upon the effect of the injection of various gases including oxygen into the veins of dogs. His method generally was to introduce the gas intermittently into the jugular vein in quantities of from 20 to 50 c.c. at a time repeating the injections after intervals of time varying from 2 to 15 minutes. As a fact he found that if he injected from 100 to 150 c.c. of oxygen gas into the venous system of a moderate sized dog in doses of 20 c.c. at a time allowing intervals of from 3 to 4 minutes between each injection, the animal seemed entirely unaffected by the injections. In a further experiment, however in which he injected 200 c.c. in doses from 30 to 40 c.c. at a time and made the last two injections at 1 minute's interval the animal died. Nyssen records the occurrence of loud gurgling cardiac murmurs after the injection and also that the whole blood was of arterial colour. Some further experiments upon the result of the injection of nitrogen into the jugular veins of dogs made by this observer are also of considerable interest to us (*vide infra*). He injected into the vein of a dog weighing

¹ *Arch. et Recherches de Physiologie et de Clinique Pathologique*, Paris, 1811.

from 7 to 8 kg quantities of nitrogen varying from 60 to 100 c.c. in doses of 20 c.c. at a time. Speaking generally, two injections at from 1 to 3 minutes' interval were not attended with any serious result.

Demarquay² made a similar series of experiments, and, in general, confirmed Nysten's results. He says that he is convinced that it is possible by making use of small doses to inject into the circulation considerable quantities of oxygen gas without producing any grave symptoms. In spite of this statement, however, Demarquay did kill an animal by the injection of oxygen gas into its jugular vein. Unfortunately, he gives neither the weight of the animal nor the quantity of oxygen. He made, however, the interesting observation that in no case did the venous blood of the injected animal become exactly like arterial, but that for some time after the injection of the oxygen the edges of artificially made wounds remained red and vascular. From this latter fact he drew the conclusion that oxygen injected into the veins remains at least in part fixed, and is not entirely used up in respiration. This observation is of interest to us with regard to three of our cases (*vide infra*) in which the beneficial result of the intravenous injection of oxygen was certainly more permanent than could apparently be explained by the mere relieving of the cyanosis.

Gaertner³ made a series of observations upon the effect of introducing gaseous oxygen into the veins of dogs. He used a continuous stream of oxygen. He observed the occurrence of loud cardiac murmurs during the administration of gas. In the animals which died he found bubbles of oxygen in the right ventricle, but never observed any in the left. He states specifically that the flow of blood containing oxygen bubbles does not obstruct the circulation through the lungs. He found that if means were used to greatly limit the respiratory oxygen the symptoms of asphyxia were much delayed and alleviated by the simultaneous administration of intravenous oxygen. He attaches great importance to the stream of oxygen being slow and continuous, and states that any dangerous symptoms which may occur may at once be relieved by discontinuing the administration. His work, he admits, was hurried in order that he "might claim priority." He suggests that intravenous oxygen might be used in the case of man, but he specifically states that he can make no suggestion with regard to method or rate of flow. He quotes Nysten and Demarquay. His observations were entirely confined to dogs and he adds very little to the work of these observers except that he used a continuous stream instead of intermittent injections.

Stuertz⁴ made an elaborate series of experiments upon the respiratory exchange occurring in dogs under the influence of the continuous intravenous injection of oxygen. His conclusions are that the oxygen introduced in this way is almost entirely used for respiratory purposes, and that a considerable proportion of the oxygen necessary for respiration can be introduced in this way. In his opinion the oxygen is best introduced not continuously but intermittently. He disagrees with many of Gaertner's conclusions, and from his experiments, which were made on dogs, confirms the results of other observers with regard to the absence, or at any rate infrequency, of gas embolism.

Mariani,⁵ using pure oxygen and an elaborate apparatus, though less elaborate than that of Stuertz and Gaertner, introduced oxygen into the dorsalis pedis vein in man. The case was a dying phthisical subject. In half an hour 80 c.c. were given then a pause, and then 40 c.c. in a quarter of an hour. The pulse and respiration of the patient were improved. The injection was not repeated, and the patient died next day.

In a recent German text-book⁶ the author in a footnote makes the remark that oxygen can be introduced directly into the veins in man as a treatment for cyanosis of all kinds. No reference to literature is given and no directions with regard to quantity or technique. With this conclusion we may say at once we totally disagree. It seems to us a flagrant instance of German book making, and likely to have as a result most serious consequences.

Technique

Our own observations were made exclusively on man. We felt that in so far as the conditions calling for the intravenous administration of oxygen would be urgent ones the apparatus required would be simple. We therefore dispensed with the elaborations used for the experiments upon animals and employed the following. An ordinary cylinder of Brinn's oxygen, to which was attached a Brinn's endurance regulator. A convenient length of pressure tubing connected at one end to the regulator at the other to a piece of bent glass tubing which was drawn out at the end, and passed through one of its necks to the bottom of a two-necked wash bottle. From a similarly bent piece of glass tubing passing for about 2 inch through the other neck of the wash bottle, a further length of pressure tubing passed and was at its end attached to a fine hollow needle. This latter piece of pressure tubing was broken by the insertion of a glass T piece. To the cross limb of the T piece a small length of pressure tubing was fixed, which could be closed or opened by a screw clip. The fine hollow needle was introduced directly into the vein after the latter had been carefully dissected out. The wash bottle was filled with a 2 per cent sodium carbonate solution, before commencing the injection this was blown out by means of passing a stream of oxygen through the tubing and cannula, leaving just sufficient in the bottle to wash any further gas emerging from the cylinder.

The regulator was now set by means of the thumbcrew so that 60 bubbles passed through the wash bottle per minute. The volume of gas emerging from the cannula corresponding to a given number of bubbles passing through the wash bottle per minute was ascertained previously to the use of any regulator or wash bottle or cannula by means of an ordinary eudiometer. At the end of any given administration the volume of gas passing through the cannula was also tested by the same means. In this way, by taking the time of the injection, we were able to estimate the amount of oxygen that had been given. If, during the administration, we desired to increase or diminish the rate we counted the bubbles passing through the wash bottle, took the time for which they were given, and subsequently estimated the amount of gas emerging from the cannula with the same rate of bubbles passing through the wash bottle.

We found it convenient to use the cross limb of the T piece, inserted into the tube between the wash bottle and the cannula, as a kind of by pass. When we increased the rate of flow we partially opened the screw clip connected by the pressure tubing with the cross-limb of the T piece and closed it gradually when the desired rate was established. By this means any sudden rush of oxygen into the vein was prevented, and sufficient oxygen passed during the change of rate to prevent blood clot occurring in the cannula. This latter point we found very important, as from our experience we should say that displacement of a clot is a more fertile source of danger to the patient than introduction of oxygen.

Before we began our observations we endeavoured to obtain an absolutely pure oxygen. Such oxygen can be obtained, but owing to war conditions we were unable to obtain any. The oxygen we actually used, as we have said above, was Brinn's oxygen, this contains, or may contain 1.5 per cent of nitrogen (we believe it is obtained by fractional liquefaction of air). In the light of further knowledge and of Nysten's experiments upon the injection into the veins of pure nitrogen gas we do not think this quantity of nitrogen of any importance. The veins we used were numerous. The one we eventually found most convenient was one of the small veins on the dorsum of the foot. In our first observation we used two veins simultaneously. From the theoretical standpoint we thought this would be advantageous. We subsequently found however that we could introduce quite sufficient oxygen to relieve cyanosis by using one cannula only and also that having two canals considerably complicated the technique.

Results

The result of our observations is that oxygen gas can be introduced into the veins in quantities from 500 to 1000 c.c. at the rate of from 600 to 1200 c.c. per hour. Cyanosis and the dyspnoea attending it are rapidly relieved, the rate usually begins with 500 c.c. per hour. The more cyanotic the patient the better is a rapid rate tolerated. As the cyanosis is reduced the rate should be diminished.

During the administration the pulse should be watched and the heart auscultated frequently. Loud cardiac murmurs are allied to stomach or intestinal rumbles in character than to ordinary cardiac murmurs may in fact often develop during the administration. These murmurs are not an indication to stop the administration, but, as a matter of fact, with careful administration they never need occur at all. Irregularity in a previously regular pulse or increased irregularity in a previously irregular pulse is an indication to cease the injection. This phenomenon, in our experience, is preceded by a soft systolic murmur heard over the area of the tricuspid valve and this murmur should be listened for. The metallic gurglings described above are almost certainly due to the gas being churned in the heart. The soft systolic murmur on the other hand, and the irregularity of the pulse are probably due to acute dilatation of the right side of the heart.

In our experience the best method is to inject the gas for periods of from 10 to 15 minutes with pauses of two or three minutes between injecting during these pauses just enough gas to prevent clotting in the cannula. We have only had one case which presented any unfavourable symptoms, and we think they were entirely due to faulty technique in that we increased the rate too rapidly. This was our first case and we were using two cannulae.

The patient had been having intravenous oxygen at the rate of 600 c.c. per hour for more than 20 consecutive minutes. We then rapidly doubled the rate. The patient was an old man with chronic respiratory disease. The cyanosis had been completely relieved before we increased the rate. Soon after the increase of rate a soft systolic murmur was heard over the right side of the heart and almost immediately afterwards the pulse became irregular. The patient began to wawn and in answer to a question said he felt giddy. Shortly afterwards both his hands dropped to his side and his legs became flaccid, and he exhibited an extensor plantar reflex on each side. He then appeared to lose himself and made no reply to questions. His colour kept good, his pulse became no worse, and his respiratory movements were slow but regular. The injection was stopped and he was sent back to bed. He rapidly revived, and half an hour afterwards he was sitting up in bed quite conscious and comfortable, and the plantar response was flexor on both sides. The patient's only complaint was of a slight numbness in his hands and feet. This continued with diminished intensity for a day or two and then disappeared. The improvement in his colour and breathing lasted some considerable time after the injection and the patient himself maintains that it has lasted ever since.

As we related above this is the only case in which we have had any untoward effects at all and we attribute them to a gush of oxygen through both cannulae upon doubling the rate of injection in a patient who had had oxygen injected continuously for 20 minutes previously and in whom the cyanosis had been completely relieved. With regard to the apparently lasting benefit experienced by this patient we may quote two other cases in which also apparently a lasting improvement occurred.

One was a case of malignant disease of the mediastinum with pressure upon the roots of both lungs and double pleural effusion. This woman was deeply cyanosed, and was the subject of acute attacks of life-threatening dyspnoea which eventually were only very partially relieved by the inhalation of oxygen. This patient was treated by intravenous injection of oxygen which was continued for one hour. The cyanosis was immediately relieved, and subsequently the dyspnoea attacks were relieved for a week, and the patient's condition improved. She had much less cyanosis and much less dyspnoea.

The second case in which apparently permanent benefit accrued was one of advanced pernicious anaemia. This patient was having frequent attacks of dyspnoea upon slight movement in bed and also frequent attacks of vomiting. He was given an intravenous injection of oxygen for 40 minutes. His attacks of dyspnoea subsequently became less intense and his vomiting less frequent and from then until the present time he has continued to improve. His condition before the injection was certainly desperate if not moribund.

In our experience the phenomenon to be feared as likely to cause serious symptoms during the intravenous injection of oxygen is dilatation of the heart. The ideal case for reaping benefit from this treatment is one in which the cyanosis and dyspnoea are due to acute respiratory difficulty and in which the heart is fairly healthy. We do not think the method is likely to be of benefit in the cyanosis and

dyspnoea occurring in cases of morbus cordis in which there is marked degeneration of the myocardium. If it seemed desirable to adopt it under such conditions we should suggest that an intravenous injection of digitalin or strophanthin be given first. It is in this particular that we disagree most emphatically from the view quoted above from the German text-book that the intravenous injection of oxygen can be used to relieve cyanosis of any kind.

The object of this preliminary note is not to indicate the specific pathological conditions in which the intravenous injection of oxygen should be used, but simply to point out that in those cases in which the inhalation of oxygen either cannot be practised or gives inadequate relief the intravenous method of oxygen administration if carefully carried out in accordance with the above directions, is available to the clinician and will give therapeutic results.

ON THE GLUTEAL FOLD IN SCIATIC NEURITIS

By HILDRED CARLILL, M.A., M.D. CANTAB.,
M.R.C.P. LOND.,

TEMPORARY SURGEON R.N. NEUROLOGIST R.N. HOSPITAL, HASLAR
PHYSICIAN SEAMEN'S HOSPITAL AND MILLER GENERAL HOSPITAL,
GREENWICH ASSISTANT PHYSICIAN WEST END HOSPITAL FOR
DISEASES OF NERVOUS SYSTEM, LONDON LECTURER ON
MEDICINE LONDON SCHOOL OF CLINICAL MEDICINE

It is hoped that these notes may serve to call attention to a fact in the diagnosis of sciatic neuritis which does not appear to have received much attention in the text-books. It is that the gluteal fold may be very poorly developed in this condition. Commonly it is absent altogether, and this may be the case whether the affection is unilateral, bilateral, or part of a multiple peripheral neuritis.

Although this observation is original in the sense that the writer noticed the condition for himself without external assistance, it is not claimed that it is novel, nevertheless, a search through the available neurological literature has been unsuccessful in finding any reference to the condition. In Gordon's book¹ there are two photographs which show the abolition of the fold, and Turner and Stewart² also give a picture which illustrates the condition. The first two however are instances of a different affection from that under discussion and in all three there is considerable wasting of the limb, in addition to which there is some flexion of the lower extremity on the affected side. No reference can be found in Allbutt and Rolleston's System³ and neither Oppenheim⁴ nor Dana⁵ mention it in their text-books. In the photograph of a man with sciatica and scoliosis which the former author gives the gluteal folds are well marked.

It is well recognised that the gluteal fold is not formed by the lower and medial border of the gluteus maximus, indeed this side of the muscular parallelogram crosses very obliquely the fold of the nates as its fibres pass from above downwards and laterally. It is not a little surprising that authors have always been at pains to mention this fact but the writer has found that their reasons for so doing are not quite extinct.

The fold depends upon the tension of the fascia and its adherence to the subcutaneous fat the skin being creased when the thigh is extended upon the trunk—namely, in the erect position of the body. When the thigh is flexed, either in health or in disease the fold is lost. Disappearance of the fold in the absence of any alteration in position of the lower extremities alters the expression of the buttocks. The chief action of the gluteus maximus is to extend the hip-joint more especially in movements which require considerable muscular effort.⁶ When the thigh is kept flexed as in cases of hip disease for example the muscle atrophies from disuse.

It will be recalled that the sciatic nerve is so named only after it leaves the greater sciatic foramen. It is composed of two distinct sections common peroneal and tibial (external and internal popliteal). The level at which the main trunk divides into its two component parts varies to a considerable extent.

The nerve-supply of the gluteus maximus is by the inferior gluteal nerve and the posterior cutaneous nerve of the thigh (small sciatic). Probably the muscular branch of the latter nerve is part of the former.⁷ Farr⁸ refers to the inferior

¹ The patient is now (August 1916) at a convalescent home.

from 7 to 8 kg quantities of nitrogen varying from 60 to 100 c.c. in doses of 20 c.c. at a time. Speaking generally, two injections at from 1 to 3 minutes' interval were not attended with any serious result.

Demarquay² made a similar series of experiments, and, in general, confirmed Nysten's results. He says that he is convinced that it is possible by making use of small doses to inject into the circulation considerable quantities of oxygen gas without producing any grave symptoms. In spite of this statement, however, Demarquay did kill an animal by the injection of oxygen gas into its jugular vein. Unfortunately, he gives neither the weight of the animal nor the quantity of oxygen. He made, however, the interesting observation that in no case did the venous blood of the injected animal become exactly like arterial, but that for some time after the injection of the oxygen the edges of artificially made wounds remained red and vascular. From this latter fact he drew the conclusion that oxygen injected into the veins remains at least in part fixed, and is not entirely used up in respiration. This observation is of interest to us with regard to three of our cases (*vide infra*) in which the beneficial result of the intravenous injection of oxygen was certainly more permanent than could apparently be explained by the mere relieving of the cyanosis.

Gaertner³ made a series of observations upon the effect of introducing gaseous oxygen into the veins of dogs. He used a continuous stream of oxygen. He observed the occurrence of loud cardiac murmurs during the administration of gas. In the animals which died he found bubbles of oxygen in the right ventricle, but never observed any in the left. He states specifically that the flow of blood containing oxygen bubbles does not obstruct the circulation through the lungs. He found that if means were used to greatly limit the respiratory oxygen the symptoms of asphyxia were much delayed and alleviated by the simultaneous administration of intravenous oxygen. He attaches great importance to the stream of oxygen being slow and continuous, and states that any dangerous symptoms which may occur may at once be relieved by discontinuing the administration. His work, he admits, was hurried in order that he "might claim priority." He suggests that intravenous oxygen might be used in the case of man but he specifically states that he can make no suggestion with regard to method or rate of flow. He quotes Nysten and Demarquay. His observations were entirely confined to dogs and he adds very little to the work of these observers except that he used a continuous stream instead of intermittent injections.

Stuertz⁴ made an elaborate series of experiments upon the respiratory exchange occurring in dogs under the influence of the continuous intravenous injection of oxygen. His conclusions are that the oxygen introduced in this way is almost entirely used for respiratory purposes, and that a considerable proportion of the oxygen necessary for respiration can be introduced in this way. In his opinion the oxygen is best introduced not continuously but intermittently. He disagrees with many of Gaertner's conclusions, and from his experiments, which were made on dogs, confirms the results of other observers with regard to the absence, or at any rate infrequency, of gas embolism.

Mariani,⁵ using pure oxygen and an elaborate apparatus, though less elaborate than that of Stuertz and Gaertner, introduced oxygen into the dorsalis pedis vein in man. The case was a dying phthisical subject. In half an hour 80 c.c. were given then a pause, and then 40 c.c. in a quarter of an hour. The pulse and respiration of the patient were improved. The injection was not repeated, and the patient died next day.

In a recent German text-book⁶ the author in a footnote makes the remark that oxygen can be introduced directly into the veins in man as a treatment for cyanosis of all kinds. No reference to literature is given and no directions with regard to quantity or technique. With this conclusion we may say at once we totally disagree. It seems to us a flagrant instance of German book making, and likely to have as a result most serious consequences.

Technique

Our own observations were made exclusively on man. We felt that in so far as the conditions calling for the intravenous administration of oxygen would be urgent ones apparatus required would be simple. We therefore dispensed with the elaborations used for the experiments upon animals and employed the following. An ordinary cylinder of British oxygen, to which was attached a Brinn's endurance regulator. A convenient length of pressure tubing connected at one end to the regulator at the other to a piece of bent glass tubing which was drawn out at the end, and passed through one of its necks to the bottom of a two-necked wash bottle. From a similarly bent piece of glass tubing passing for about an inch through the other neck of the wash bottle a further length of pressure tubing passed and was at its end attached to a fine hollow needle. This latter piece of pressure tubing was broken by the insertion of a glass T piece. To the cross limb of the T piece a small length of pressure tubing was fixed, which could be closed or opened by a screw clip. A fine hollow needle was introduced directly into the vein. The latter had been carefully dissected out. The wash bottle was filled with a 2 per cent sodium carbonate solution before commencing the injection this was blown out by means of passing a stream of oxygen through the tubing cannula, leaving just sufficient in the bottle to wash further gas emerging from the cylinder.

The regulator was now set by means of the thumb screw so that 60 bubbles passed through the wash bottle per minute. The volume of gas emerging from the cannula corresponding to a given number of bubbles passing through the wash bottle per minute was ascertained previously to the use of any regulator or wash bottle or cannula by means of an ordinary endiometer. At the end of any given administration the volume of gas passing through the cannula was tested by the same means. In this way, by taking the rate of the injection, we were able to estimate the amount of oxygen that had been given. If, during the administration we desired to increase or diminish the rate we counted bubbles passing through the wash bottle, took the time which they were given, and subsequently estimated the amount of gas emerging from the cannula with the rate of bubbles passing through the wash bottle.

We found it convenient to use the cross limb of the T piece, inserted into the tube between the wash bottle and the cannula, as a kind of by-pass. When we increased the rate of flow we partially opened the screw clip connecting the pressure tubing with the cross limb of the T piece. When we closed it gradually when the desired rate was established. By this means any sudden rush of oxygen into the vein was prevented, and sufficient oxygen passed during the change of rate to prevent blood clot occurring in the cannula. At this latter point we found very important, as from our experience we should say that displacement of a clot is a more frequent source of danger to the patient than introduction of oxygen.

Before we began our observations we endeavoured to obtain an absolutely pure oxygen. Such oxygen can be obtained, but owing to war conditions we were unable to obtain any. The oxygen we actually used, as we have said above, was Brinn's oxygen, this contains, or may contain, 1.5 per cent of nitrogen (we believe it is obtained by fractional liquefaction of air). In the light of further knowledge and of Nysten's experiments upon the injection of pure nitrogen gas we do not think this quantity of nitrogen of any importance. The veins we used were numerous. The one we eventually found most convenient was one of the small veins on the dorsum of the foot. Our first observation we used two veins simultaneously. From the theoretical standpoint we thought this would be advantageous. We subsequently found however that this could introduce quite sufficient oxygen to relieve cyanosis using one cannula only and also that having two cannulae considerably complicated the technique.

Results

The result of our observations is that oxygen gas can be introduced into the veins in quantities from 500 to 1600 c.c. at the rate of from 600 to 1200 c.c. per hour. Cyanosis, the dyspnoea attending it, is rapidly relieved. The rate usually began with 500 c.c. per hour. The more cyanotic the patient the better is a rapid rate tolerated. As cyanosis is reduced the rate should be diminished.

During the administration the pulse should be watched and the heart auscultated frequently. Loud cardiac murmurs are allied to stomach or intestinal rumbles in character than to ordinary cardiac murmurs may in fact often develop during the administration. These murmurs are not an indication to stop the administration, but, as a matter of fact, with careful administration they never need occur at all. Irregularity in a previously regular pulse or increased irregularity in a previously irregular pulse is an indication to cease the injection. This phenomenon, in our experience, is preceded by a soft systolic murmur heard over the area of the tricuspid valve and this murmur should be listened for. The metallic gurglings described above are almost certainly due to the gas being churned in the heart. The soft systolic murmur, on the other hand, and the irregularity of the pulse are probably due to acute dilatation of the right side of the heart.

In our experience the best method is to inject the gas for periods of from 10 to 15 minutes with pauses of two or three minutes between injecting during these pauses just enough gas to prevent clotting in the cannula. We have only had one case which presented any unfavourable symptoms, and we think they were entirely due to faulty technique in that we increased the rate too rapidly. This was our first case and we were using two cannulae.

The patient had been having intravenous oxygen at the rate of 600 c.c. per hour for more than 20 consecutive minutes. We then rapidly doubled the rate. The patient was an old man with chronic respiratory disease. The cyanosis had been completely relieved before we increased the rate. Soon after the increase of rate a soft systolic murmur was heard over the right side of the heart and almost immediately afterwards the pulse became irregular. The patient began to yawn and in answer to a question said he felt giddy. Shortly afterwards both his hands dropped to his side and his legs became flaccid, and he exhibited an extensor plantar reflex on each side. He then appeared to lose himself and made no reply to questions. His colour kept good, his pulse became no worse, and his respiratory movements were slow but regular. The injection was stopped and he was sent back to bed. He rapidly revived, and half an hour afterwards he was sitting up in bed quite conscious and comfortable, and the plantar response was flexor on both sides. The patient's only complaint was of a slight numbness in his hands and feet. This continued with diminished intensity for a day or two and then disappeared. The improvement in his colour and breathing lasted some considerable time after the injection and the patient himself maintains that it has lasted ever since.

As we related above, this is the only case in which we have had any untoward effects at all and we attribute them to a gush of oxygen through both cannulae upon doubling the rate of injection in a patient who had had oxygen injected continuously for 20 minutes previously, and in whom the cyanosis had been completely relieved. With regard to the apparently lasting benefit experienced by this patient we may quote two other cases in which also apparently a lasting improvement occurred.

One was a case of malignant disease of the mediastinum with pressure upon the roots of both lungs and double pleural effusion. This woman was deeply cyanosed and was the subject of acute attacks of life-threatening dyspnoea which eventually were only very partially relieved by the inhalation of oxygen. This patient was treated by intravenous injection of oxygen which was continued for one hour. The cyanosis was immediately relieved and subsequently the dyspnoea attacks were relieved for a week, and the patient's condition improved. She had much less cyanosis and much less dyspnoea.

The second case in which apparently permanent benefit accrued was one of advanced pernicious anemia. This patient was having frequent attacks of dyspnoea upon slight movement in bed, and also frequent attacks of vomiting. He was given an intravenous injection of oxygen for 40 minutes. His attacks of dyspnoea subsequently became less intense and his vomiting less frequent and from then until the present time he has continued to improve. His condition before the injection was certainly desperate if not moribund.

In our experience the phenomenon to be feared as likely to cause serious symptoms during the intravenous injection of oxygen is dilatation of the heart. The ideal case for reaping benefit from this treatment is one in which the cyanosis and dyspnoea are due to acute respiratory difficulty and in which the heart is fairly healthy. We do not think the method is likely to be of benefit in the cyanosis and

dyspnoea occurring in cases of morbus cordis in which there is marked degeneration of the myocardium. If it seemed desirable to adopt it under such conditions we should suggest that an intravenous injection of digitalin or strophanthin be given first. It is in this particular that we disagree most emphatically from the view quoted above from the German text book that the intravenous injection of oxygen can be used to relieve cyanosis of any kind.

The object of this preliminary note is not to indicate the specific pathological conditions in which the intravenous injection of oxygen should be used, but simply to point out that in those cases in which the inhalation of oxygen either cannot be practised or gives inadequate relief the intravenous method of oxygen administration if carefully carried out in accordance with the above directions, is available to the clinician and will give therapeutic results.

ON THE GLUTEAL FOLD IN SCIATIC NEURITIS

By HILDRED CARLILL, M.A., M.D. CANTAB.,
M.R.C.P. LOND.

TEMPORARY SURGEON R.N. NEUROLOGIST R.N. HOSPITAL, HASLAR

MEDICINE LONDON SCHOOL OF CLINICAL MEDICINE

It is hoped that these notes may serve to call attention to a fact in the diagnosis of sciatic neuritis which does not appear to have received much attention in the text books. It is that the gluteal fold may be very poorly developed in this condition. Commonly it is absent altogether, and this may be the case whether the affection is unilateral, bilateral, or part of a multiple peripheral neuritis.

Although this observation is original in the sense that the writer noticed the condition for himself without external assistance, it is not claimed that it is novel, nevertheless, a search through the available neurological literature has been unsuccessful in finding any reference to the condition. In Gordon's book¹ there are two photographs which show the abolition of the fold, and Turner and Stewart² also give a picture which illustrates the condition. The first two however are instances of a different affection from that under discussion, and in all three there is considerable wasting of the limb, in addition to which there is some flexion of the lower extremity on the affected side. No reference can be found in Allbutt and Rolleston's System³ and neither Oppenheim⁴ nor Dana⁵ mention it in their text-books. In the photograph of a man with sciatica and scoliosis which the former author gives the gluteal folds are well marked.

It is well recognised that the gluteal fold is not formed by the lower and medial border of the gluteus maximus, indeed this side of the muscular parallelogram crosses very obliquely the fold of the nates as its fibres pass from above downwards and laterally. It is not a little surprising that authors have always been at pains to mention this fact, but the writer has found that their reasons for so doing are not quite extinct.

The fold depends upon the tension of the fascia and its adherence to the subcutaneous fat the skin being creased when the thigh is extended upon the trunk—namely in the erect position of the body. When the thigh is flexed, either in health or in disease the fold is lost. Disappearance of the fold in the absence of any alteration in position of the lower extremities alters the expression of the buttocks. The chief action of the gluteus maximus is to extend the hip joint more especially in movements which require considerable muscular effort.⁶ When the thigh is kept flexed, as in cases of hip disease, for example the muscle atrophies from disuse.

It will be recalled that the sciatic nerve is so named only after it leaves the greater sciatic foramen. It is composed of two distinct sections common peroneal and tibial (external and internal popliteal). The level at which the main trunk divides into its two component parts varies to a considerable extent.

The nerve supply of the gluteus maximus is by the inferior gluteal nerve and the posterior cutaneous nerve of the thigh (small sciatic). Probably the muscular branch of the latter nerve is part of the former.⁶ Parr⁷ refers to the inferior

¹ The patient is now (August 15th) at a convalescent home.

from 7 to 8 kg quantities of nitrogen varying from 60 to 100 c.c. in doses of 20 c.c. at a time. Speaking generally, two injections at from 1 to 3 minutes' interval were not attended with any serious result.

Demarquay² made a similar series of experiments, and in general confirmed Nysten's results. He says that he is convinced that it is possible by making use of small doses to inject into the circulation considerable quantities of oxygen gas without producing any grave symptoms. In spite of this statement, however, Demarquay did kill an animal by the injection of oxygen gas into its jugular vein. Unfortunately, he gives neither the weight of the animal nor the quantity of oxygen. He made, however, the interesting observation that in no case did the venous blood of the injected animal become exactly like arterial, but that for some time after the injection of the oxygen the edges of artificially made wounds remained red and vascular. From this latter fact he drew the conclusion that oxygen injected into the veins remains at least in part fixed, and is not entirely used up in respiration. This observation is of interest to us with regard to three of our cases (*vide infra*) in which the beneficial result of the intravenous injection of oxygen was certainly more permanent than could apparently be explained by the mere relieving of the cyanosis.

Gaertner³ made a series of observations upon the effect of introducing gaseous oxygen into the veins of dogs. He used a continuous stream of oxygen. He observed the occurrence of loud cardiac murmurs during the administration of gas. In the animals which died he found bubbles of oxygen in the right ventricle, but never observed any in the left. He states specifically that the flow of blood containing oxygen bubbles does not obstruct the circulation through the lungs. He found that if means were used to greatly limit the respiratory oxygen the symptoms of asphyxia were much delayed and alleviated by the simultaneous administration of intravenous oxygen. He attaches great importance to the stream of oxygen being slow and continuous, and states that any dangerous symptoms which may occur may at once be relieved by discontinuing the administration. His work, he admits, was hurried in order that he "might claim priority." He suggests that intravenous oxygen might be used in the case of man, but he specifically states that he can make no suggestion with regard to method or rate of flow. He quotes Nysten and Demarquay. His observations were entirely confined to dogs, and he adds very little to the work of these observers except that he used a continuous stream instead of intermittent injections.

Stuertz⁴ made an elaborate series of experiments upon the respiratory exchange occurring in dogs under the influence of the continuous intravenous injection of oxygen. His conclusions are that the oxygen introduced in this way is almost entirely used for respiratory purposes, and that a considerable proportion of the oxygen necessary for respiration can be introduced in this way. In his opinion the oxygen is best introduced not continuously but intermittently. He disagrees with many of Gaertner's conclusions, and from his experiments, which were made on dogs, confirms the results of other observers with regard to the absence, or at any rate infrequency, of gas embolism.

Marani,⁵ using pure oxygen and an elaborate apparatus, though less elaborate than that of Stuertz and Gaertner, introduced oxygen into the dorsalis pedis vein in man. The case was a dying phthisical subject. In half an hour 80 c.c. were given then a pause and then 40 c.c. in a quarter of an hour. The pulse and respiration of the patient were improved. The injection was not repeated, and the patient died next day.

In a recent German text-book⁶ the author in a footnote makes the remark that oxygen can be introduced directly into the veins in man as a treatment for cyanosis of all kinds. No reference to literature is given and no directions with regard to quantity or technique. With this conclusion we may say at once we totally disagree. It seems to us a flagrant instance of German book making, and likely to have as a result most serious consequences.

Technique

Our own observations were made exclusively on man. We felt that in so far as the conditions calling for the intravenous administration of oxygen would be urgent ones the apparatus required would be simple. We therefore dispensed with the elaborations used for the experiments upon animals, and employed the following. An ordinary cylinder of Brinn's oxygen, to which was attached a Brinn's endurance regulator. A convenient length of pressure tubing connected at one end to the regulator at the other to a piece of bent glass tubing which was drawn out at the end, and passed through one of its necks to the bottom of a two-necked wash bottle. From a similarly bent piece of glass tubing, passing for about an inch through the other neck of the wash bottle a further length of pressure tubing passed and was at its end attached to a fine hollow needle. This latter piece of pressure tubing was broken by the insertion of a glass T piece. To the cross limb of the T piece a small length of pressure tubing was fixed, which could be closed or opened by a screw clip. The fine hollow needle was introduced directly into the vein after the latter had been carefully dissected out. The wash bottle was filled with a 2 per cent sodium carbonate solution, before commencing the injection this was blown out by means of passing a stream of oxygen through the tubing and cannula, leaving just sufficient in the bottle to wash any further gas emerging from the cylinder.

The regulator was now set by means of the thumb-screw so that 60 bubbles passed through the wash bottle per minute. The volume of gas emerging from the cannula corresponding to a given number of bubbles passing through the wash bottle per minute was ascertained previously to the use of any regulator or wash bottle or cannula by means of an ordinary eudiometer. At the end of any given administration the volume of gas passing through the cannula was also tested by the same means. In this way, by taking the time of the injection, we were able to estimate the amount of oxygen that had been given. If, during the administration, we desired to increase or diminish the rate we counted the bubbles passing through the wash bottle, took the time for which they were given, and subsequently estimated the amount of gas emerging from the cannula with the same rate of bubbles passing through the wash bottle.

We found it convenient to use the cross limb of the T piece, inserted into the tube between the wash bottle and the cannula, as a kind of by-pass. When we increased the rate of flow we partially opened the screw clip connected by the pressure tubing with the cross limb of the T piece and closed it gradually when the desired rate was established. By this means any sudden rush of oxygen into the vein was prevented, and sufficient oxygen passed during the change of rate to prevent blood clot occurring in the cannula. This latter point we found very important, as from our experience we should say that displacement of a clot is a more fertile source of danger to the patient than introduction of oxygen.

Before we began our observations we endeavoured to obtain an absolutely pure oxygen. Such oxygen can be obtained, but owing to war conditions we were unable to obtain any. The oxygen we actually used, as we have said above was Brinn's oxygen, this contains, or may contain 1.5 per cent of nitrogen (we believe it is obtained by fractional liquefaction of air). In the light of further knowledge and of Nysten's experiments upon the injection into the veins of pure nitrogen gas we do not think this quantity of nitrogen of any importance. The veins we used were numerous. The one we eventually found most convenient was one of the small veins on the dorsum of the foot. In our first observation we used two veins simultaneously. From the theoretical standpoint we thought this would be advantageous. We subsequently found however, that we could introduce quite sufficient oxygen to relieve cyanosis using one cannula only and also that having two cannulae considerably complicated the technique.

Results

The result of our observations is that oxygen gas can be introduced into the veins in quantities from 500 to 1000 c.c. at the rate of from 600 to 1200 c.c. per hour. Cyanosis and the dyspnoea attending it are rapidly relieved, the rate usually begins with 500 c.c. per hour. The more cyanosis the patient the better is a rapid rate tolerated. As cyanosis is reduced the rate should be diminished.

In our experience the phenomenon to be feared as likely to cause serious symptoms during the intravenous injection of oxygen is dilatation of the heart. The ideal case for reaping benefit from this treatment is one in which the cyanosis and dyspnoea are due to acute respiratory difficulty and in which the heart is fairly healthy. We do not think the method is likely to be of benefit in the cyanosis and

dyspnoea occurring in cases of morbus cordis in which there is marked degeneration of the myocardium. If it seemed desirable to adopt it under such conditions we should suggest that an intravenous injection of digitalin or atrophanthin be given first. It is in this particular that we disagree most emphatically from the view quoted above from the German text-book that the intravenous injection of oxygen can be used to relieve cyanosis of any kind.

The object of this preliminary note is not to indicate the specific pathological conditions in which the intravenous injection of oxygen should be used, but simply to point out that in those cases in which the inhalation of oxygen either cannot be practised or gives inadequate relief the intravenous method of oxygen administration if carefully carried out in accordance with the above directions is available to the clinician and will give therapeutic results.

ON THE GLUTEAL FOLD IN SCIATIC NEURITIS

By HILDRED CARLILL, M.A., M.D. CANTAB.,
M.R.C.P. LOND.

TEMPORARY SURGEON R.N. NEUROLOGIST R.N. HOSPITAL, HASLAR
PHYSICIAN SEAMEN'S HOSPITAL AND MILLER GENERAL HOSPITAL,
GREENWICH. ASSISTANT PHYSICIAN WEST END HOSPITAL FOR
DISEASES OF NERVOUS SYSTEM LONDON. LECTURER ON
MEDICINE LONDON SCHOOL OF CLINICAL MEDICINE.

It is hoped that these notes may serve to call attention to a fact in the diagnosis of sciatic neuritis which does not appear to have received much attention in the text-books. It is that the gluteal fold may be very poorly developed in this condition. Commonly it is absent altogether, and this may be the case whether the affection is unilateral, bilateral, or part of a multiple peripheral neuritis.

Although this observation is original in the sense that the writer noticed the condition for himself without external assistance, it is not claimed that it is novel, nevertheless, a search through the available neurological literature has been unsuccessful in finding any reference to the condition. In Gordon's book¹ there are two photographs which show the abolition of the fold, and Turner and Stewart² also give a picture which illustrates the condition. The first two however are instances of a different affection from that under discussion, and in all three there is considerable wasting of the limb in addition to which there is some flexion of the lower extremity on the affected side. No reference can be found in Allbutt and Rolleston's System³ and neither Oppenheim⁴ nor Dana⁵ mention it in their text-books. In the photograph of a man with sciatica and scoliosis which the former author gives the gluteal folds are well marked.

It is well recognised that the gluteal fold is not formed by the lower and medial border of the gluteus maximus, indeed, this side of the muscular parallelogram crosses very obliquely the fold of the nates, as its fibres pass from above downwards and laterally. It is not a little surprising that authors have always been at pains to mention this fact, but the writer has found that their reasons for so doing are not quite extinct.

The fold depends upon the tension of the fascia and its adherence to the subcutaneous fat the skin being creased when the thigh is extended upon the trunk—namely in the erect position of the body. When the thigh is flexed, either in health or in disease the fold is lost. Disappearance of the fold in the absence of any alteration in position of the lower extremities alters the expression of the buttocks. The chief action of the gluteus maximus is to extend the hip-joint more especially in movements which require considerable muscular effort.⁶ When the thigh is kept flexed, as in cases of hip disease for example the muscle atrophies from disuse.

It will be recalled that the sciatic nerve is so named only after it leaves the greater sciatic foramen. It is composed of two distinct sections: common peroneal and tibial (external and internal popliteal). The level at which the main trunk divides into its two component parts varies to a considerable extent.

The nerve-supply of the gluteus maximus is by the inferior gluteal nerve and the posterior cutaneous nerve of the thigh (small sciatic). Probably the muscular branch of the latter nerve is part of the former.⁷ Farr⁸ refers to the inferior

from 7 to 8 kg quantities of nitrogen varying from 60 to 100 c.c. in doses of 20 c.c. at a time. Speaking generally, two injections at from 1 to 3 minutes' interval were not attended with any serious result.

Demarquay² made a similar series of experiments, and in general, confirmed Nysten's results. He says that he is convinced that it is possible by making use of small doses to inject into the circulation considerable quantities of oxygen gas without producing any grave symptoms. In spite of this statement, however, Demarquay did kill an animal by the injection of oxygen gas into its jugular vein. Unfortunately, he gives neither the weight of the animal nor the quantity of oxygen. He made, however, the interesting observation that in no case did the venous blood of the injected animal become exactly like arterial, but that for some time after the injection of the oxygen the edges of artificially made wounds remained red and vascular. From this latter fact he drew the conclusion that oxygen injected into the veins remains at least in part fixed, and is not entirely used up in respiration. This observation is of interest to us with regard to three of our cases (*vide infra*) in which the beneficial result of the intravenous injection of oxygen was certainly more permanent than could apparently be explained by the mere relieving of the cyanosis.

Gaertner³ made a series of observations upon the effect of introducing gaseous oxygen into the veins of dogs. He used a continuous stream of oxygen. He observed the occurrence of loud cardiac murmurs during the administration of gas. In the animals which died he found bubbles of oxygen in the right ventricle, but never observed any in the left. He states specifically that the flow of blood containing oxygen bubbles does not obstruct the circulation through the lungs. He found that if means were used to greatly limit the respiratory oxygen the symptoms of asphyxia were much delayed and alleviated by the simultaneous administration of intravenous oxygen. He attaches great importance to the stream of oxygen being slow and continuous, and states that any dangerous symptoms which may occur may at once be relieved by discontinuing the administration. His work, he admits, was hurried in order that he "might claim priority." He suggests that intravenous oxygen might be used in the case of man, but he specifically states that he can make no suggestion with regard to method or rate of flow. He quotes Nysten and Demarquay. His observations were entirely confined to dogs and he adds very little to the work of these observers except that he used a continuous stream instead of intermittent injections.

Stuertz⁴ made an elaborate series of experiments upon the respiratory exchange occurring in dogs under the influence of the continuous intravenous injection of oxygen. His conclusions are that the oxygen introduced in this way is almost entirely used for respiratory purposes, and that a considerable proportion of the oxygen necessary for respiration can be introduced in this way. In his opinion the oxygen is best introduced not continuously but intermittently. He disagrees with many of Gaertner's conclusions, and from his experiments, which were made on dogs, confirms the results of other observers with regard to the absence, or at any rate infrequency of gas embolism.

Mariani,⁵ using pure oxygen and an elaborate apparatus, though less elaborate than that of Stuartz and Gaertner, introduced oxygen into the dorsalis pedis vein in man. The case was a dying phthisical subject. In half an hour 80 c.c. were given then a pause, and then 40 c.c. in a quarter of an hour. The pulse and respiration of the patient were improved. The injection was not repeated, and the patient died next day.

In a recent German text-book⁶ the author in a footnote makes the remark that oxygen can be introduced directly into the veins in man as a treatment for cyanosis of all kinds. No reference to literature is given and no directions with regard to quantity or technique. With this conclusion we may say at once we totally disagree. It seems to us a flagrant instance of German book making, and likely to have as a result most serious consequences.

Technique

Our own observations were made exclusively on man. We felt that in so far as the conditions calling for the intravenous administration of oxygen would be urgent ones the apparatus required would be simple. We therefore dispensed with the elaborations used for the experiments upon animals and employed the following. An ordinary cylinder of Brinn's oxygen, to which was attached a Brinn's endurance regulator. A convenient length of pressure tubing connected at one end to the regulator at the other to a piece of bent glass tubing, which was drawn out at the end, and passed through one of its necks to the bottom of a two-necked wash bottle. From a similarly bent piece of glass tubing, passing for about a inch through the other neck of the wash bottle a further length of pressure tubing passed and was at its end attached to a fine hollow needle. This latter piece of pressure tubing was broken by the insertion of a glass T piece. To the cross limb of the T piece a small length of pressure tubing was fixed, which could be closed or opened by a screw clip. The fine hollow needle was introduced directly into the vein after the latter had been carefully dissected out. The wash-bottle was filled with a 2 per cent sodium carbonate solution, before commencing the injection this was blown out by means of passing a stream of oxygen through the tubing and cannula, leaving just sufficient in the bottle to wash any further gas emerging from the cylinder.

The regulator was now set by means of the thumb-screw so that 60 bubbles passed through the wash bottle per minute. The volume of gas emerging from the cannula corresponding to a given number of bubbles passing through the wash bottle per minute was ascertained previously to the use of any regulator or wash bottle or cannula by means of an ordinary endiometer. At the end of any given administration the volume of gas passing through the cannula was also tested by the same means. In this way, by taking the time of the injection, we were able to estimate the amount of oxygen that had been given. If, during the administration, we desired to increase or diminish the rate we counted the bubbles passing through the wash bottle took the time for which they were given, and subsequently estimated the amount of gas emerging from the cannula with the same rate of bubbles passing through the wash bottle.

We found it convenient to use the cross limb of the T-piece, inserted into the tube between the wash bottle and the cannula, as a kind of by-pass. When we increased the rate of flow we partially opened the screw clip connected by the pressure tubing with the cross-limb of the T-piece and closed it gradually when the desired rate was established. By this means any sudden rush of oxygen into the vein was prevented, and sufficient oxygen passed during the change of rate to prevent blood clot occurring in the cannula. This latter point we found very important, as from our experience we should say that displacement of a clot is a more fertile source of danger to the patient than introduction of oxygen.

Before we began our observations we endeavoured to obtain an absolutely pure oxygen. Such oxygen can be obtained, but owing to war conditions we were unable to obtain any. The oxygen we actually used, as we have said above, was Brinn's oxygen, this contains, or may contain 1.5 per cent of nitrogen (we believe it is obtained by fractional liquefaction of air). In the light of further knowledge and of Nysten's experiments upon the injection of the veins of pure nitrogen gas we do not think this quantity of nitrogen of any importance. The veins we used were numerous. The one we eventually found most convenient was one of the small veins on the dorsum of the foot. In our first observation we used two veins simultaneously. From the theoretical standpoint we thought this would be advantageous. We subsequently found, however, that we could introduce quite sufficient oxygen to relieve cyanosis using one cannula only and also that having two canals considerably complicated the technique.

Results

The result of our observations is that oxygen gas can be introduced into the veins in quantities from 500 to 1000 c.c. at the rate of from 600 to 1200 c.c. per hour. Cyanosis of the dyspnoea attending it are rapidly relieved, the rate usually begin with 500 c.c. per hour. The more cyanosis the patient the better is a rapid rate tolerated. As the cyanosis is reduced the rate should be diminished.

During the administration the pulse should be watched and the heart auscultated frequently. Loud cardiac murmurs are allied to stomach or intestinal rumbles in character and ordinary cardiac murmurs may in fact often do, vealop during the administration. These murmurs are not an indication to stop the administration, but, as a matter of fact with careful administration they never need occur. Irregularity in a previously regular pulse or increased regularity in a previously irregular pulse is an indication to cease the injection. This phenomenon, in our experience preceded by a soft systolic murmur heard over the area of the tricuspid valve and this murmur should be listened for the metallic gurglings described above are almost certainly due to the gas being churned in the heart. The soft systolic murmur on the other hand, and the irregularity of the pulse are probably due to acute dilatation of the right side of the heart.

In our experience the best method is to inject the gas for periods of from 10 to 15 minutes with pauses of two or three minutes between injecting during these pauses just enough as to prevent clotting in the cannula. We have only had one case which presented any unfavourable symptoms and we think there were entirely due to faulty technique in that we increased the rate too rapidly. This was our first case and we were using two cannulae.

The patient had been having intravenous oxygen at the rate of 600 c.c. per hour for more than 20 consecutive minutes. We then rapidly doubled the rate. The patient was an old man with chronic respiratory disease. The cyanosis had been completely relieved before we increased the rate. Soon after the increase of rate a soft systolic murmur was heard over the right side of the heart and almost immediately afterwards the pulse became irregular. The patient began to rawn and in answer to a question said he felt giddy. Shortly afterwards both his hands dropped to his side and his legs became flaccid, and he exhibited an extensor plantar reflex on each side. He then appeared to lose himself and made no reply to questions. His colour kept good his pulse became no worse and his respiratory movements were slow but regular. The injection was stopped and he was sent back to bed. He rapidly revived, and half an hour afterwards he was sitting up in bed quite conscious and comfortable and the plantar response was flexor on both sides. The patient's only complaint was of a slight numbness in his hands and feet. This continued with diminished intensity for a day or two and then disappeared. The improvement in his colour and breathing lasted some considerable time after the injection and the patient himself maintains that it has lasted ever since.

As we related above this is the only case in which we have had any untoward effects at all and we attribute them to a gush of oxygen through both cannulae upon doubling the rate of injection in a patient who had had oxygen injected continuously for 20 minutes previously and in whom the cyanosis had been completely relieved. With regard to the apparently lasting benefit experienced by this patient we may quote two other cases in which also apparently a lasting improvement occurred.

One was a case of malignant disease of the mediastinum with pressure upon the roots of both lungs and double pleural effusion. This woman was deeply cyanosed and was the subject of acute attacks of life-threatening dyspnoea which eventually were only very partially relieved by the inhalation of oxygen. This patient was treated by intravenous injection of oxygen which was continued for one hour. The cyanosis was immediately relieved and subsequently the dyspnoea attacks were relieved for a week, and the patient's condition improved she had much less cyanosis and much less dyspnoea.

The second case in which apparently permanent benefit accrued was one of advanced pernicious anaemia. This patient was having frequent attacks of dyspnoea upon slight movement in bed, and also frequent attacks of vomiting. He was given an intravenous injection of oxygen for 40 minutes. His attacks of dyspnoea subsequently became less intense and his vomiting less frequent and from then until the present time he has continued to improve. His condition before the injection was certainly desperate if not moribund.

In our experience the phenomenon to be feared as likely to cause serious symptoms during the intravenous injection of oxygen is dilatation of the heart. The ideal case for reaping benefit from this treatment is one in which the cyanosis and dyspnoea are due to acute respiratory difficulty and in which the heart is fairly healthy. We do not think the method is likely to be of benefit in the cyanosis and

dyspnoea occurring in cases of morbus cordis in which there is marked degeneration of the myocardium. If it seemed desirable to adopt it under such conditions we should suggest that an intravenous injection of digitalin or strophanthin be given first. It is in this particular that we disagree most emphatically from the view quoted above from the German text-book that the intravenous injection of oxygen can be used to relieve cyanosis of any kind.

The object of this preliminary note is not to indicate the specific pathological conditions in which the intravenous injection of oxygen should be used but simply to point out that in those cases in which the inhalation of oxygen either cannot be practised or gives inadequate relief the intravenous method of oxygen administration if carefully carried out in accordance with the above directions is available to the clinician and will give therapeutic results.

ON THE GLUTEAL FOLD IN SCIATIC NEURITIS

By HILDRED CARLILL, M.A., M.D. CANTAB.,
M.R.C.P. LOND.

TEMPORARY SURGEON R.N. VETERINARIAN R.N. HOSPITAL, HARLAR
PHYSICIAN SEAMEN'S HOSPITAL AND MILLER GENERAL HOSPITAL,
GREENWICH ASSISTANT PHYSICIAN WEST END HOSPITAL FOR
DISEASES OF VERTEBRAL SYSTEM LONDON LECTURER ON
MEDICINE LONDON SCHOOL OF CLINICAL MEDICINE

It is hoped that these notes may serve to call attention to a fact in the diagnosis of sciatic neuritis which does not appear to have received much attention in the text-books. It is that the gluteal fold may be very poorly developed in this condition. Commonly it is absent altogether and this may be the case whether the affection is unilateral, bilateral or part of a multiple peripheral neuritis.

Although this observation is original in the sense that the writer noticed the condition for himself without external assistance it is not claimed that it is novel, nevertheless, a search through the available neurological literature has been unsuccessful in finding any reference to the condition. In Gordon's book¹ there are two photographs which show the abolition of the fold, and Turner and Stewart² also give a picture which illustrates the condition. The first two, however, are instances of a different affection from that under discussion and in all three there is considerable wasting of the limb in addition to which there is some flexion of the lower extremity on the affected side. No reference can be found in Allbutt and Rolleston's System³ and neither Oppenheim⁴ nor Dana⁵ mention it in their text-books. In the photograph of a man with sciatica and scoliosis which the former author gives the gluteal folds are well marked.

It is well recognised that the gluteal fold is not formed by the lower and medial border of the gluteus maximus, indeed, this side of the muscular parallelogram crosses very obliquely the fold of the nates as its fibres pass from above downwards and laterally. It is not a little surprising that authors have always been at pains to mention this fact but the writer has found that their reasons for so doing are not quite extinct.

The fold depends upon the tension of the fascia and its adherence to the subcutaneous fat the skin being creased when the thigh is extended upon the trunk—namely in the erect position of the body. When the thigh is flexed either in health or in disease the fold is lost. Disappearance of the fold in the absence of any alteration in position of the lower extremities alters the expression of the buttocks. The chief action of the gluteus maximus is to extend the hip-joint more especially in movements which require considerable muscular effort. When the thigh is kept flexed as in cases of hip disease for example the muscle atrophies from disuse.

It will be recalled that the sciatic nerve is so named only after it leaves the greater sciatic foramen. It is composed of two distinct sections common peroneal and tibial (external and internal popliteal). The level at which the main trunk divides into its two component parts varies to a considerable extent.

The nerve supply of the gluteus maximus is by the inferior gluteal nerve and the posterior cutaneous nerve of the thigh (small sciatic). Probably the muscular branch of the latter nerve is part of the former. Harris⁶ refers to the inferior

¹ The patient is now (August 1916) at a convalescent home.

gluteal nerve as a branch of the posterior cutaneous nerve of the thigh. The fibres of these nerves leave the sacral plexus by the fifth lumbar and the first and second sacral nerves, the posterior cutaneous nerve of the thigh having an origin also from the third sacral nerve. Now the anterior divisions of the lower four lumbar and upper two sacral nerves divide into anterior and posterior parts⁸ and it is the three nerves (L 5 and S 1 and 2) which give rise to the inferior gluteal nerve, which also, by their posterior parts, join to form the common peroneal section of the sciatic. The superior gluteal nerve supplies the gluteus medius and minimus and also the tensor fasciæ femoris.

The gluteal fold varies in degree in normal persons, but as a rule it is well marked. It is often duplicated and may be seen in triplicate. When it is poorly developed the subject can increase it usually by tightening up his gluteal muscles or by throwing back the trunk. Bending forwards or flexing the thigh cause the fold to be obliterated. The influence of flexion or extension is found only in association with tension of the fascia. The fold is well marked in people who have an excess of fat in the gluteal region, normal or pathological.

Now, to what cause is the obliteration of the fold in sciatic neuritis due? It must depend on flexion of the thigh or upon some alteration in the condition of the underlying structures beneath the fold. In my cases there was no flexion of the thigh. In some cases Laségue's sign was also negative—that is to say, the thigh could be flexed on the trunk, with the leg extended without causing pain⁹. When the sign is positive, from stretching of the nerve, it is a certain indication of a degree of affection in the nerve fibres or in their sheath. The test is performed in the same manner as that employed in eliciting Kernig's sign in cases of meningitis, but the significance of the positive test differs in the two instances. It has been shown that Laségue's sign may be accompanied by momentary dilatation of the pupil, together with a raised blood pressure and an increase of the pulse-rate¹⁰. These signs occur in association with the pain and serve to support a diagnosis of sciatica in cases where malinger is suspected. Laségue's sign, as well as Kernig's, may be tested for with the patient in the sitting position.

Experiments prove that flexion of the thigh by itself stretches the sciatic nerve. On the other hand, flexion of

As regards changes in the underlying structures some of my patients had wasting of the gluteal muscles, which were soft and flabby, but certainly others had no perceptible wasting in this region, nor was there any which could be measured in the thigh or calf. In the absence of both wasting and flexion it is not easy to say how the loss of the fold comes about. In a man who fell on to his left buttock and developed a traumatic cutaneous neuritis, with anaesthesia over his left gluteal region so that he was totally unable to recognise that he was sitting on materials of dissimilar consistency, the folds were normal.

Abolition of the ankle jerk in sciatic neuritis depends usually on loss of conduction of the message in the tibial or sciatic nerves or in the roots of the sacral plexus. It has been pointed out above, however, that the nerve-supply of the gluteus maximus is derived from the nerves which go to form the common peroneal trunk. It would appear therefore, that in those cases of neuritis in which both the ankle-jerk and the gluteal fold are lost the whole thickness of the sciatic nerve is affected. Yet such cases may show no weakness of the muscles supplied by the common peroneal (and this is more vulnerable, as a rule than the tibial), and, indeed, we may see patients with this condition who have no complaint whatsoever and who are discovered by accident. Absent ankle jerks in persons who have normal folds and who present no other signs of neuritis are not uncommonly discovered in alcoholics and others. They must then be looked upon as the solitary sign of a toxic neuritis.

The absence of the gluteal folds in people with peripheral neuritis would go to prove that the whole length of the nerve is affected, including the roots of the sacral plexus. I have not yet seen a sufficient number of patients from this point of view, however, to enable me to state whether the folds are always abolished in this affection, but those cases which are not severe as regards their motor and reflex functions certainly have normal folds.

Mistakes may be made, as in Case 3. In this man repeated examinations were made by the writer and many other observers but the knee jerks and the ankle jerks could not be elicited. It was noted too, that the gluteal folds were poorly developed. Later, however, all these deep reflexes were obtained, but only with the aid of veritable reinforcements of reinforcement.

The value of the sign is certainly greater when one side

FIG 1 (Case 2)

Poorly developed gluteal folds in a man with peripheral neuritis. The left fold has nearly disappeared. Note that there is no flexion of the thigh.

FIG 2

Normal gluteal folds in a man of the same age as Fig. 1

the knee at once relaxes the nerve and it is this position which the patient adopts in painful affections of the nerve. As he does so he unconsciously flexes the thigh also, the two movements being normally simultaneous.

Those patients with neuritis in whom I have found the folds absent invariably had abolition of the ankle jerk.¹¹ This is an important fact in the diagnosis between a neuritis on the one hand and pain, whether local or referred, in the distribution of the nerve, on the other. It is submitted that the condition of the fold may be of considerable diagnostic value in these cases, and may, indeed be of great importance in those patients in whom it is not possible to test the ankle jerk. In cases in which the jerk is absent the Achilles tendon may be diminished in size.

only is affected, as a comparison can be made between the two folds.

In one man who had suffered from pain in the left calf for two months, but who was not incapacitated, I failed to obtain the ankle jerk on that side. His fold was quite normal, however, and there was no other sign of disease. Six weeks later the ankle jerk was elicited, but only when the tendon was struck on the outer side. No special treatment had been adopted and I wondered whether the diagnosis of neuritis was correct or whether the jerk had never been absent.

It should be mentioned that in none of my cases had any injection or nerve stretching treatment been employed.

I wish to thank particularly Professor Arthur Robinson of Edinburgh who has verified some of the anatomical statements, and Fleet-Surgeon J Stoddart, R.N., who kindly took for me the photograph of Case 4

Appended are brief notes of the cases whose photographs are shown. In none of the patients were there vaso-motor or trophic changes

CASE 1—Gunner, R.M.A., aged 36. Two years' history of pain all over the left leg and thigh, intermittent, but had never been two days without pain. Laségue's sign positive on left side and left ankle jerk absent. Well marked scoliosis, with the anal cleft running obliquely. Circumference of the left thigh and leg $1\frac{1}{2}$ inches and $\frac{1}{2}$ inch less than the respective measurements on the right side. Gluteal mass on the left side very flabby and fold poorly marked. A great difference existed between the two folds. This was, however, not nearly so marked as in Case 4, although in the latter the signs were only found by looking for them.

CASE 2—Patient, aged 24, suffered from peripheral neuritis following dysentery. He contracted the latter disease at Gallipoli in September, 1915. When he reached England in December his knee-jerks and ankle jerks were noted to be absent according to the patient, and he said that he had numbness of the legs. There was also muscular hyperalgesia of his calves. In March, 1916, his legs were still painful, and there was an extraordinarily well marked condition of steppage gait. His knee-jerks were now present, but the ankle-jerks were absent. Laségue's sign was positive. There were several tender points down the back of the thigh, and there was blunting to pin pricks over the front of the shins. The gluteal folds were very poorly marked, notably on the left side (Figs 1 and 2).

FIG. 3 (Case 4)

Absence of the gluteal fold in sciatic neuritis. Note that there is no apparent wasting of the muscles and no flexion of the thigh.

CASE 3—Patient, aged 23, had apparent absence of tendon jerks in lower limbs. These were elicited only with the greatest trouble. Gluteal folds poorly marked but symmetrical. This case is alluded to in the text.

CASE 4—Gunner, R.M.A., aged 32. This man complained of nothing at all. He was found to have no ankle-jerk on the left side during a routine examination of the reflexes of the ship's company. Absence of the left gluteal fold was also observed (Fig. 3) but no other objective signs of disease were detected. He admitted to having had a "stitch in the calves" for two or three years, and he said that at night he sometimes had cramps in the toes and feet on both sides. He stood to attention without any difficulty and was doing hard work without pain or discomfort. He had never been laid up. There was absolutely no evidence of wasting in the gluteal muscles and they contracted powerfully. The left calf was less than $\frac{1}{2}$ inch smaller than the right. This is within normal variations. There was no motor weakness and no sensory change either objective or subjective, on the occasions of examination.

A CASE OF DILATATION OF THE HEPATIC FLEXURE OF THE COLON

GIVING RISE TO THE PHYSICAL SIGNS USUALLY ASSOCIATED WITH SUBPHRENIC PYOPNEUMOTHORAX

By W. J. MORRISH, M.D. Lond., M.R.O.S.

With a Note by T. D. ACLAND, M.D. Oxon., F.R.C.P. Lond., Major, R.A.M.C. (T)

THE following case is thought worthy of record not only on account of the rarity of the condition but also because of the importance of recognising the possibility of its occurrence when deciding the question for or against an exploratory laparotomy in any case in which the normal liver dullness is replaced by a resonant note, but in which other evidences of intra-abdominal or intra-thoracic suppuration are absent.

The patient, aged 20, enlisted as a private in the Royal Army Medical Corps in January, 1914. As far as he knows he was quite well at the time, and had not had any other illness except chicken pox, whooping cough, and measles as a child. His bowels had never given him any real trouble, though they were inclined to constipation, which was easily overcome by a simple aperient. He arrived in Alexandria in September, 1914, and was on duty at a military hospital, where he remained for six months, during the first three of which he was nursing cases of dysentery, and for the last three waited upon convalescent medical patients. During the whole of this period he remained well. At the end of April he was sent to Gallipoli, where he acted as water duty man to the battalion and helped at the first aid station. After he had been there for three and a half months he began to feel poorly, complaining of dizziness and of easily getting tired. He then developed diarrhoea, passing mucus all the time and blood on two occasions, but he still remained at work. After three weeks jaundice came on, and he was then sent into hospital, being transferred in a day or two to hospital at Mudros. Four weeks later he was sent to England as a case of "convalescent jaundice" and was admitted to the Tooting Military Hospital on Nov. 11th, 1915. No record is available as to his condition while in hospital at Mudros, but he says that on admission to the First East Lancs Field Ambulance his temperature was 101°F . While at Mudros his stools were examined, and he was given four doses of emetine, but no enemata. Ever since the first onset of diarrhoea his stools had remained loose.

On admission to the Tooting Military Hospital the patient complained of pains in the stomach and diarrhoea, and pain and loss of power in the legs, especially in the right, which had developed during the voyage home. His evening temperature was 98.6° and the pulse rate 94. The heart and lungs were normal. On the morning of Nov. 14th the right ankle was found to be oedematous and the pain became worse, and by the 16th the left ankle was also swollen, but never so much so as the right.

Major Acland, R.A.M.C. (T), saw the patient soon after his admission and made the following note: "Patient is emaciated. Has moderate pyrexia and peripheral neuritis of lower extremities. Over the right lower quadrant of the thorax (which inspection shows to be considerably bulged), the liver dullness is replaced by a tympanitic note which is unmistakable, and which gives in places a well-defined coin note; there is obviously some air containing cavity or viscus. It is unlike pneumothorax and is certainly not a pulmonary cavity. Also the lung seems to expand over it during deep inspiration, so that probably it is below the diaphragm, in which case it might be that the liver has shrunk and fallen away from the chest wall, leaving the colon to ride over it, or it might be a subphrenic or hepatic abscess or a hydatid. The signs of an inflammatory lesion are inconclusive, since the abdomen moves well and the thoracic movements are not notably diminished. An X-ray would decide the point as to which side of the diaphragm the lesion is, and I think this should be taken."

Next day Dr Russell J. Reynolds reported as follows: "On X-ray examination the patient's liver appears normal, ascending and transverse colon very much distended with gas and coinciding with the tympanitic area made out on percussion." Enemata of plain water and turpentine and water were administered daily and brought away large quantities of flatus and some faecal material, but the tympanitic area remained well defined, although the coin note could not always be elicited, although bulging of the side was less noticeable. The oedema, diminished and the pain in the shins steadily, and the patient was able to move his legs more freely. Massage to the colon and the limbs was ordered, but

after two applications to the abdomen he asked that it might be stopped as it made him feel sick. It was continued to the legs, and the improvement was for a time maintained. Between Nov 11th and Dec 13th the temperature was irregularly intermittent, but from that time onwards, with two short periods of fever (maximum 101°), it was seldom raised above normal, and the patient felt much better, the tympanic area, however, still persisted, though it varied in size, and the coin note could not always be obtained. On Dec 17th, further to elucidate the true nature of the condition, Dr Reynolds skiagraphed the abdomen after a bismuth meal. It will be seen from the skiagram that the

Reproduction of skiagram showing the colon 24 hours after a bismuth meal

hepatic flexure of the colon corresponds exactly to the tympanic area marked out on the first examination.

At first the case seemed to do well, the pain in the limbs diminished, and the power of movement greatly improved, but in January, 1916, the patient began to suffer from increased looseness of the bowels which developed into an intractable diarrhoea, for which numerous remedies were tried without success. There was not at any time vomiting, though there were intermittent attacks of abdominal pain. As the condition gradually became worse it was decided to explore the abdomen in the hope of giving relief. The operation was successfully performed on March 8th by Mr E. Gillespie to whom I am indebted for the following note: "On making a median incision it was found that there was marked distension of the cæcum and ascending colon to the middle of the transverse colon. The cause of this was an extensive adhesion implicating the great omentum and passing from the great curvature of the stomach across the transverse colon to the duodeno-jejunal flexure. It was evident from inspection that peristalsis would give rise to tension of the gut and a kink. The portion of the great intestine distal to the adhesion was collapsed. The adhesion was divided and ligatured, the appendix was removed since the distal third had become sclerosed and the lumen almost obliterated, though this condition did not seem to be connected with the intestinal lesion. A caseating mesenteric gland in the iliac portion of the small intestine was found and removed. The stomach, duodenum, and gall bladder were normal."

The immediate effect of the operation seemed to be beneficial. The abdominal pain became less, and for a time not only did the general condition improve but the patient began to put on a little flesh. Before long, however, the previous symptoms began to recur. An intractable diarrhoea resisted all remedies and he slowly lost ground. The emaciation became extreme. Gallate of bismuth, opium, salol, lead and opium and permanganate of iron by the month, and injections of silver nitrate and quinine by the rectum were tried to no purpose.

The only remedy which appeared to exercise any control over the diarrhoea was atropine given in doses of gr 1/100 with tincture of opium, min x. The patient wasted literally to a skeleton, and it is greatly to the credit of the nursing that in spite of the fact that he not infrequently had as many as from 15 to 20 loose motions a day, he never had a bed sore.

Death occurred on Sunday, May 14th, and an examination of the abdominal organs showed that the ascending and transverse colon was dilated and that the walls were thinned. There was no evidence of ulceration or inflammation, thickening or abscess. The mucous membrane was atrophied and over considerable areas was denuded of epithelium. The small intestine showed similar change, but in a much less marked degree. The condition was one of chronic enterocolitis. There were a few small mesenteric glands but no inflammatory changes were found in the liver, spleen or kidneys. By special request the thoracic organs were not examined.

Note by Major T. D. ACLAND, R.A.M.C.

The condition found in the case narrated above is of sufficient rarity to warrant its being put on record. A subphrenic pyopneumothorax on the right side, resulting from suppuration connected with the liver, duodenum, or appendix or from suppurating hydatid cyst, is, unfortunately, not uncommon. Again, partial obliteration of the liver dullness owing to the presence of gas in the peritoneal cavity or to the colon distended as a result of the softening and weakening of the walls from chronic dysentery or from obstruction below, or from paralysis (such as that which occurs in peritonitis) over riding the organ, is only too frequently met with. To find practically the whole of the normal liver dullness replaced by a tympanic area giving rise to a well marked coin percussion note without either acute atrophy of liver, transposition of viscera, or evidence of some inflammatory lesion in the abdomen or thorax, is unusual.

In cases in which the hepatic flexure of the colon is greatly dilated from any cause the liver is generally pushed up, rather than away, from the chest wall, and if this latter condition is found it is unusual to find more than the lower two inches of liver dullness replaced by a tympanic note.

The only case which I have so far been able to find in an extensive search through the literature of the subject¹ is one recorded by M. Bédère.² In this instance, with the help of a radioscopic screen, which was then just coming into use, an air containing cavity was diagnosed below the diaphragm on the right side. The condition was associated with physical signs in the right lung which were at first thought to be due to advanced pulmonary tuberculosis and subsequently to an interlobar empyema. Later, when by the aid of the X ray screen an air containing cavity was detected below the diaphragm, which obliterated the normal liver dullness it was surmised that the patient was suffering from a subphrenic abscess which communicated with a bronchus. Both surmises were incorrect. A few days later the patient died almost suddenly and post mortem it was found that the supposed subphrenic abscess was a local distension (ectopic) of the colon, and had no connexion of any kind with the pulmonary lesion which was bronchiectasis. In the case recorded above there were no signs of pulmonary or abdominal disease to lead one astray, while the fact that the cavity altered in size aroused a suspicion that it might in spite of its position, possibly be due to the distension of one of the hollow viscera—e.g., stomach (by transposition) or colon. A bismuth meal put the question beyond doubt.

The reproduction of the skiagram taken by Dr Reynolds shows the distended hepatic flexure of the colon 24 hours after taking a bismuth meal. It will be noted that the ascending and descending colons are comparatively empty and that the hepatic flexure looks as if it had a kink in it such as might result from adhesions formed by a local peritonitis or an old tuberculous gland.

TYPHUS IN GLASGOW.—Dr A. K. Chalmers, medical officer of health of Glasgow, reported last week to his committee the occurrence of eight cases of typhus in Partick during the month of July. The first cases recognized sickened between June 30th and July 3rd, a second group of cases occurred on July 16th and 20th, and a further group being the third generation of contacts occurred on July 22nd and 30th. The simultaneous sickening of the four patients who formed the first group suggested to Dr Chalmers an undiscovered infection which might produce further cases elsewhere.

Reviews and Notices of Books.

Squire's Companion to the British Pharmacopœia

By PETER WATT SQUIRE. Nineteenth edition. London J and A. Churchill 1916 Pp 1712 Price 15s net

"Squire's Companion" is one of those books which having stood the test of time may be regarded as being above criticism. To medical practitioners and pharmacists it is familiar as a household word. The British medical man who does not know this book must indeed be a *rara avis*, its only fault is its size, for it is not a book one can conveniently carry about for ready reference, and its companionship is therefore restricted to the study and the consulting room. The nineteenth edition records advances in medical and pharmaceutical sciences almost up to the early summer of this year, which is saying a great deal for anyone who has had anything to do with the preparation of a large volume of this nature and one which must have a great circulation, can appreciate the difficulties in the way of keeping the matter quite up to date from p 1 to p 1712. One finds a description of the uses of hypochlorous acid as an antiseptic, the iodine treatment of wounds fully dealt with, and a reference to chloramine. The compounds more recently employed in the treatment of syphilis—e.g., neo-kharsivan, galyi, and intramine—receive attention. If the author and his collaborators were prevented by the pressure of the times from completing their work so that it might appear more quickly on the heels of the new British Pharmacopœia, the users of the book will find compensation for the delay in the extra information the author has been able to include concerning therapeutical progress subsequent to the issue of the 1914 Pharmacopœia.

No change has been made in the general arrangement of the book as a work of reference, thus, a practitioner who has been familiar with "Squire" through one edition after another will know precisely where to find what he wants in the nineteenth edition. As formerly, the monograph on each substance gives first the Latin title then the English title, then the French, German, Italian, and Spanish names under which the drug or its preparations are known, then follows a short description of the drug and in the generality of cases a short account of its usual method of preparation, solubility, medicinal properties, dose, prescribing notes, incompatibles, official preparations, preparations that are not official, antidotes, and other information. The medical portion of the book has been revised by Dr Taylor Grant and the notes on the medicinal properties of the drugs are really concentrated accounts of all that is worth knowing—for practical purposes—of the drugs in question. To prescribers these notes are very valuable and hardly less useful are the prescribing notes which represent Mr Squire's personal experience of over 40 years in the dispensing of prescriptions. Perhaps it is that pharmacists are rather shy about making suggestions to medical men but authors of books of this class are not over generous in their prescribing hints. And so we make the suggestion to Mr Squire that in a future edition practitioners would welcome the inclusion in these notes of an occasional model prescription, for thoughtful practitioners recognise that the pharmacist often knows more about the art of combining drugs than does the doctor. The objection might perhaps be made that the book is already big enough but a few extra pages would not noticeably add to its size, while they might add greatly to its usefulness.

The changes that have been made in the 1893 and 1914 British Pharmacopœias, the alterations in the strength of the various preparations are clearly indicated. One of the distinctive features of the first edition of "Squire's Companion" published more than 50 years ago was the note on solubility and this has continued to be a feature through all subsequent editions. These solubility figures are very useful to prescribers and in the present volume is included a number of figures specially determined for the nineteenth edition and in any cases of doubt previous figures have either been confirmed or new figures have been introduced. The paragraph dealing with tests have been rewritten. Besides containing a critical comparison between the tests

of the British Pharmacopœia and those of the United States and German pharmacopœias they contain many references to work done in Mr Squire's laboratory. The section on chemicals and reagents used in qualitative testing, volumetric analysis, and so on, is of greater interest to pharmacists than to medical men, but it may be added that this section has been improved considerably. Dr R T Hewlett has revised the useful chapter on therapeutic agents of microbial origin.

The Mortality from Cancer throughout the World

By F L HOFFMANN LL D New Jersey, U S A The Prudential Press 1915 Pp xv+826

THE bulky volume on cancer mortality published by the Prudential Insurance Company of America comprises 220 pages of letterpress by Dr Hoffmann and 600 pages of appendices and index giving statistical data on the subject from many countries for a varying number of recent years. Dr Hoffmann is firmly convinced that the recorded increase in cancer mortality throughout the world denotes a real increase in the frequency of the disease, and this volume although 'primarily intended to supply the necessary data for a scientific study of the cancer problem from the statistical point of view,' in reality marshals the most heterogeneous data in support of this conviction. Throughout the book one is reminded again and again of the pre eminent position taken by the work of English statisticians in the long drawn out discussion of this thorny problem. The reports of the Registrar General King and Newsholme, and the Imperial Cancer Research Fund's publications are referred to repeatedly, and the guarded statements of the Fund's reports on the significance of the recorded increase in cancer mortality are criticised with much energy.

Although the importance of actuarial correction for age and sex is insisted upon, many of the tables merely give crude rates obtained by multiplying the total deaths from cancer by 100 000 and dividing by the total population. It would have been preferable to exclude the data from those countries in which some kind of actuarial correction for age and sex is impossible rather than increase the bulk of the data by sacrificing accuracy and possibility of comparison. The fact is undoubted that when all possible actuarial corrections have been made the cancer mortality of most countries shows a definite increase and the crux of the problem lies in the difficulty of estimating the fraction of the increase which should be attributed to improvements in diagnosis and in registration of the causes of death. To take an extreme example the mortality from cancer in Manila rose from 15.8 per 100 000 of population in 1905 to 30.7 in 1910. No one is so foolish as to believe that cancer has doubled in frequency in the Philippine Islands during five years of American administration. In a less degree the same difficulty of interpretation of cancer statistics adheres to the data from countries such as England and Wales and the United States. It is also interesting to note that the cancer death rate has diminished during the last ten years in Switzerland, the country with the highest rate. Does this indicate a diminution in the frequency of cancer in Switzerland? The tables published by Dr Hoffmann do not solve either of these problems nor is it justifiable to brush the Swiss figures aside on the assumption that the cancer rate in that country being double the average for all other countries and having reached a maximum, it must diminish. As cancer accounts for about one tenth of deaths from all causes there is room, even in Switzerland, for a measurable increase.

The data are not available nor is the time yet ripe for a conclusive discussion of the full significance of the recorded increase of cancer mortality and the volume under review, while giving much of the available data in compact form, merely emphasises how far we are still removed from an objective survey of deaths from cancer. The book is well printed and most carefully revised but a larger format would have facilitated reference to the longer tables.

JOURNALS

Parasitology Vol VIII No 4 June, 1916 Cambridge University Press Price 10s net.—In this issue there is an important article by Dr G S Graham Smith, entitled "Observations on the Habits and Parasites of Common Flies." The work

described in the paper has engaged the author during the period between 1912 and the date of publication, and many of the results obtained should prove of unusual interest to those employed in public health work. The more important of the conclusions arrived at by the author may be briefly summarized as follows: 1 Amongst the common species of flies it was found that the majority passed the winter as pupæ or, rarely, as larvæ which pupate in the spring. The pupæ or larvæ are usually buried within two or three inches of the surface of the ground, but occasionally are found on the surface in sheltered positions. 2 The wintering habits of *Musca domestica* are still obscure. 3 The emergence of the "winter" pupæ is dependent upon the mean temperature of the immediate surroundings reaching a certain "critical" point, which differs for each species. The "critical" point for *Calliphora erythrocephala*, *Fannia manicata*, and *F. scalaris* is about 48°-50° F. 4 Flies emerging from "winter" pupæ are always more hardy than those of subsequent generations. The males usually emerge before the females. 5 The author's observations on blow flies, confined in a large, open air, protected cage, lead him to believe that "the estimations of the multiplication of flies" made by Howard and Fabre "are very much exaggerated." 6 The normal duration of life of the blow fly, in summer, is about 30 days. The influence of the weather on the death rate of flies is dealt with and the greatest mortality was found to occur on sultry days. 7 Of the flies which enter houses, only *M. domestica* remains for any long period. *C. erythrocephala* enters for the purpose of ovipositing on meat, *S. calcitrans* for temporary shelter, and *F. canicularis* "for some purpose at present unknown." The author suggests that *M. domestica* requires a high temperature for the development of its eggs and remains indoors until ready to oviposit. 8 Amongst the more important agents which tend to limit the numbers of flies are braconid and chalcid parasites, which bring about the destruction of large numbers of larvæ and pupæ. The braconids, *A. manducator* and *A. cephalotes* and the chalcid, *M. acasta*, hibernate in the fly puparia as larvæ, and experimental work with a view to the destruction of flies by their agency, is now being carried on. The author also deals with the part which flies play in the distribution of pathogenic bacteria, and points out that "all species of flies which visit excrement and decaying animal matter also visit ripe fruit." He adds that "great contamination of fruit on trees and exposed for sale in shops with faecal and putrefactive bacteria is caused by flies and wasps." Numerous charts and illustrations accompany the article which contains much valuable information for the practical sanitarian.

Journal of Cancer Research Vol I, No 2, 1916—The second number of the new *Journal of Cancer Research* begins with an interesting review of tumour immunity, by Dr Tyzzer. Starting from the conception, first clearly enunciated by Russell, that natural resistance to tumour inoculation is merely the consequence of capacity to react with immunity to tumour inoculation and susceptibility the failure of this reaction, Dr Tyzzer utilises the varying resistance of several strains of mice to one tumour strain to analyse tumour immunity, and to throw light on the nature of cancer. By carefully planned and recorded breeding experiments it is shown that resistance is not transmitted as a Mendelian character when resistant and susceptible strains are crossed, and the conclusion is drawn that resistance depends on the co-operation of a number of independent factors. Tumours themselves are regarded as "somatic mutations" arising in the body cells and breeding true on propagation. Dr E T Bell and Dr A T Henriques describe two renal tumours from the rabbit. The first of these corresponded in structure to the adeno-sarcomata of man, with undifferentiated cell masses tending to develop tubules and indications of glomeruli. The second case was of similar type but rather more tubular in structure. The authors suggest the name *Nephroblastoma* for tumours of this type. Dr R A Lambert gives a general survey of the application of *in vitro* culture to cancer problems. Five cases of thyroid tumour in the sea bass (*Serranus scriba* and *cabrilla*) are described and figured by Dr Marsh and Dr Youwiler. In structure the tumours varied from colloid goitres to adenoma, and there was no definite evidence of malignancy. Professor Gaylord adds remarks on thyroid enlargement in fish. The effects of cancer tissue on protozoa are utilised by Professor G N Calkins to study the biochemical differences between normal

and tumour tissue. He finds that cancer tissue added to cultures of *Didymium nasutum* a predatory infusorian stimulates the rate of division in moderate doses more than does extract of normal epithelium. Larger doses have a lethal action, absent when normal tissue is used. The results are correlated with the role of products of tissue autolysis. Chronic irritation associated with the development of cancer. The last paper by Dr Erwin F Smith, deals with crown gall of plants and its relation to human cancer. The plant tumours due to *Bact. tumefaciens* are well described and figured, and the view put forward that the tumours of man and animals are due to a similar organism.

New Inventions

A WRISTLET LIGATURE HOLDER

I HAVE used the wristlet ligature holder here illustrated for many months and find it very convenient as a time-

saving device where a number of bleeding points have to be tied in the course, for example, of such operations as removal of the breast, glands in the neck, and thyroidectomy. The lid is removable, and when secured by a bayonet catch leaves a small slit-like aperture through which the ligature material emerges. Owing to its small bulk it can be worn throughout an operation without inconvenience. The skeleton reels are removable, and a number can be kept ready wound and sterilised. A reel will easily hold 40 feet of a fine thread. If gut be used

iodine should not be utilised in its preparation, owing to its action on the metal.

The instrument has been made to my design by Messrs Meyer and Meltzer, of Great Portland street, W.

AN EGG-CUP FOR SINGLE-HANDED USE

AN egg-cup for the use of men with only one arm has been designed by Mr Magnus Volk, R.A.M.C., voluntary worker by appointment at the 2nd Eastern General Hospital, Brighton. The cup is a wooden disc, 5 inches in diameter, with projecting rubber feet. The essential features are shown in the perspective view, Fig 1 and the section, Fig 2, showing rubber feet projecting one sixteenth of an inch. The cup sits firmly on the tablecloth even when only one hand is used and the hollow is deep enough for the contained egg not to tilt. The cup has proved most useful to crippled men in the hospital. The illustrations are one-third natural size.

to tilt. The cup has proved most useful to crippled men in the hospital. The illustrations are one-third natural size.

THE NEW HULL SANATORIUM—The new sanatorium erected by the Hull Corporation on the Cottingham Castle estate the foundation stone of which was laid by the King in 1914, was opened by the Lord Mayor of Hull on August 5th. It covers 100 acres and has cost £25,231. The £10,800 have been paid by the Government. The buildings consist of an administrative block with pavilions for males and females and a hospital for advanced cases. The pavilions provide for 80 beds and the hospital block for 40 beds.

THE TREATMENT OF VENEREAL DISEASE

STERILIZABLE OUTFIT

For Dilute Intravenous Injection of GALYL or other Solutions.

Portable Oak Case
10' x 5", containing

- 1 250 c.c. Graduated Ampoule with rubber stopper and glass tube
- 1 100 c.c. Graduated Measure.
- 1 Suspension Strap
- 1 Descending Tube with index and glass nozzle fitted with short bevelled steel needle
- 1 4-oz. bottle Iodol for sterilizing puncture area

- 1 Packet Silver Threads for the needle
- 1 Plated Tube-clip to regulate flow workable with one hand
- 1 Glass Stirring rod
- 1 Glass Funnel for filtering
- 1 Packet Sterilized Cotton wool

Price, complete as above, 30/-
(Special Platinum Needle 7/6 extra)

GALYL

ROYAL COMMISSION ON VENEREAL DISEASES Final Report of the Commissioners

SUBSTITUTES FOR SALVARSAN

... another French substitute GALYL, a compound of arsenic and phosphorus has recently come into prominence and its use has been attended with considerable success

"Favourable reports have also been obtained regarding the preparation GALYL. At the Male Lock Hospital 1000 injections of this substance have been administered, and it is reported that they have been attended with as good results as in the cases treated by Salvarsan and Neosalvarsan. In no instance were the injections followed by reactions indicative of arsenic poisoning

Equally favourable results have been obtained with GALYL in the Military and Naval Medical Services and most of the large general hospitals

FORMS.

FOR DILUTE INTRAVENOUS INJECTION — In ampoules containing GALYL and the necessary dose of sodium carbonate sterile distilled water only being required to prepare the injection.

FOR CONCENTRATED INTRAVENOUS INJECTION — In Outfits containing: one flask with GALYL, one ampoule sterile carbonated serum

one liter Doses 0.10 0.15 0.20 0.25 0.30 0.35 0.40

FOR INTRAMUSCULAR INJECTIONS — In ampoules containing an oily emulsion of GALYL. Doses 0.20 0.30 0.40

POCKET CASE.

Containing the entire instruments (sterilizable) necessary for administering a concentrated intravenous injection of GALYL or other solution

- 1 Indiarubber Tube for constricting the arm
- 1 Clamp for fixing the rubber band
- 1 Glass Syringe of 10 c.c. capacity

- 1 Platinum Iridium Needle length 4 cm diameter 0.9 with short bevelled joint and special barrel. Attachable to the syringe without any additional junction.
- 1 Nickel plated Case to hold all the above
- 1 Chamols Leather Pouch
- 1 Glass Filtering Tube with rubber attachment.

Price complete - - 30/-

The Manufacturing Chemist and His Opportunity

If we may judge from the prodigious scale on which munitions are now being made in this country very little fear need be entertained that the manufacturing chemist and his staff will fail us in the time of peace. If swords can be made so can ploughshares. It must be remembered that behind all this gallant army of workers is the man of technical knowledge, who, to the surprise of many, has compounded his ingredients with the same success on the stupendous scale necessitated by the war as on the more moderate scale demanded by peace. This fact we feel bound to accept as a welcome sign of the skill and capability of our experts who, being caught in the sudden demands of an enormous emergency, were not found wanting. Surely the same willingness and devotion will be found when all arms are laid down, and when the consideration will be to beat the enemy in regard to the supply of peace munitions, of drugs, and of medicinals—things the manufacture of which, owing to our lethargy in the past, he has been able practically to monopolise.

Signs are not wanting that we are advancing in this direction, for prices are falling on certain commodities which formerly we derived wholly from the enemy and we have reason for believing that British manufacturers are turning serious attention to the production of a great many articles of medicinal, industrial, and domestic importance. Slowly but surely are being laid the foundations of new industries which it is hoped will render us independent at all events in many directions, of external supplies. A serious difficulty in such enterprises will of course arise where nature has not endowed us with a large amount of raw material, but it is good to know that in many cases our opportunities are equal to, if not greater than, the enemy's. A special fiscal policy to meet the case may be required, and will undoubtedly be forthcoming if needed. That is a matter we do not discuss, what we desire to point out is that there are just as clever and capable chemists in this country as in any other, who, if only they are given the same facilities, opportunities, and financial backing as the manufacturing chemists in Germany for example receive, would occupy the premier position. This position is still held by us as discoverers and pioneers of research. Here we have never lost predominance, but we have lost industrial supremacy owing to a steady and persistent refusal of the State to afford capital and encouragement necessary to sustain work and to

bring it into the provinces of practical application. The ground in many directions is being prepared, and if our manufacturers can be guaranteed that capital outlay on new extensions of business is not going to be destroyed by unfair competition when the war is over, we know that they will prove themselves capable of turning out goods of the highest standard. In proof we may mention the rapid strides which the glass trade is making in supplying glassware equal in all detailed particulars to material hitherto obtained from the enemy. Apart from special glass required in industrial applications, we find that many of our glass making firms are undertaking the manufacture of glass adapted for pharmaceutical purposes, optical lenses, X ray bulbs, thermometers, "shell" for the artificial human eye, glass also for the artificial lens, things never made a special department of before in the history of glass manufacture in this country. This is only one example of the spirit that is steadily and surely growing amongst our chemists and manufacturers, and we may be sure that the same spirit is active in other departments of our industries.

It is the great demand for munitions which makes it difficult to manufacture freely just now many well known medicinals and chemicals. The curious fact is that the basis of munitions and of certain drugs is one and the same thing. To take an example, the salicylates have as their starting point phenol, but so has picric acid. The urgency of things gives the first call to an explosive and not to a drug, and so salicylic acid, aceto salicylic acid, and the salicylates are rare and dear. This, of course, is no reproach to our chemists, they cannot make munitions and drugs at the same time when the raw material of both is the same, and when to finish the war at the earliest possible date is the supreme consideration. Yet another example is that of benzene and its homologues, they are the foundation of dye making, and are also the basis of the great nitro explosives of the type of T.N.T., and for the moment the need of the explosive is more urgent than the need of the dye. But we may reasonably expect that the lesson of the war is not going to be lost by the leaders of our chemical industries, and it is to be hoped that they will receive the support of our administrators. Materials, financial backing, and all round fair dealing are the things that are asked, and our brains and workers will not fail us.

The Status of the Certified Midwife

It is now 14 years since the provisions of the Midwives Act came into force in this country, and during this time the status of the certified midwife has gradually become more definite and the distinction more clear between her functions and those of the uncertified maternity nurse. The same provisions have recently been extended to Scotland by the Midwives (Scotland) Act of 1915, with the modifications suggested by experience, and legislation in similar form will shortly come into force in Ireland. The Midwives Acts prohibit any woman who is not certified under the Acts from

habitually and for gain attending women in child birth otherwise than under the direction of a qualified medical practitioner, but we repeat it because the meaning of the law appears to escape some doctors. In certain disciplinary cases which the General Medical Council have recently had before them it has been shown that uncertified women have been in effect enabled to defy the law through the countenance, assistance, or connivance of qualified medical practitioners. This has been done either by practitioners paying perfunctory visits to confinement cases and signing legal certificates and kindred documents required—for example, in relation to National Health Insurance or notification to authorities—or by their countenancing in other ways a pretence that the uncertified woman was acting under the direction of a qualified medical practitioner. In some of the cases of this latter sort which have come to our knowledge the practitioner has acted inadvertently and without understanding the full mischievousness of his procedure, but in other cases this could hardly be pleaded.

The Executive Committee of the General Medical Council has now characterised such conduct as discreditable and tending to the defeat of the due working of Acts of Parliament which are of the utmost importance to the welfare of the poorer classes and therefore of the nation, particularly at the present time. The Executive Committee has therefore framed a draft notice for presentation to the Council at the November session stating that any registered practitioner who is proved to have covered an uncertified woman in the manner indicated will be liable, after the notice has been ratified by the Council, to have his name removed from the Medical Register. The covering letter which will accompany this notice when issued adds that the General Medical Council regards it as the duty of registered medical practitioners to coöperate with the constituted authorities in helping to secure the strict and effective administration of the Midwives Acts. That the practitioner's duty and enlightened interest here coincide can hardly be a matter for doubt at the present time. There are far too few civilian practitioners now available to attend all the parturient women in the country, and if the medical man cannot attend a labour himself he should prefer the attendance of a woman with at all events the standard of attainment implied by the possession of the Central Midwives Board's certificate. A certain conservatism in favour of old established practices, some still surviving anxiety regarding the competition of the certified midwife, or even ignorance of the provisions of the Act, may have resulted in the covering of an uncertified woman. But the medical practitioner cannot any longer consistently with medical ethics or the law of the land give the uncertified woman the support of his authority unless he actually takes charge of the case himself.

It may be felt that the penal provisions of the Midwives Acts, and the suggested notice of the General Medical Council press hardly upon patient and doctor in cases of emergency, and where the

supply of certified women is not equal to the demand for them. That this has not been forgotten is evidenced by a sentence in the covering letter calling the practitioner's attention to the fact that the penal provisions of the Acts do not apply to anyone rendering assistance in a case of emergency. The position of the medical practitioner in regard to the obtaining of assistance from maternity nurses who are not registered by the Central Midwives Board, or whose names have been removed from the Register has recently been elucidated in a correspondence which appeared in our columns between a practitioner and the President of the Board. Sir FRANCIS CHAMPNEYS stated that there was nothing to prevent a woman whose name had been struck off the Midwives Roll, or who had resigned, from acting as a monthly nurse under the instructions of the practitioner, with the proviso that the practitioner undertakes to attend the confinement whenever it occurs (day or night), even normal. The Central Midwives Board in any case of dispute acts on the principle that the case belongs to the person who has undertaken to attend the confinement. We think the medical profession may rest assured that their interests have been fairly considered by the constituted authorities.

Annotations.

'No quid nimis'

SOLDIERS AND THE LAND

A CONFERENCE has been sitting recently to consider questions connected with rural reform, and among other points to which its attention has been directed has been the part to be played in rural reform by those who, when the war has finally ended, will be discharged from their country's service. At the conference, which owed its origin to the Garden Cities and Town Planning Association, the importance of rapidly developing facilities for small holdings was insisted upon, but evidently doubts were felt as to the fitness of the class indicated for working small holdings and making a living out of them. The conference, therefore, has recorded a conviction that—

1 For ex service men desiring to live on the land in the home country employment at wages, whether on farms or in schemes of reclamation or afforestation affords the only practicable opportunity at any rate in the first instance.

2 That urban ex service men will not accept such employment unless wages and houses are greatly better than they were on the average before the war.

3 That both in recognition of the services of our sailors and soldiers and on grounds of national expediency the need of a Government policy and legislation to effect such improvement in wages and housing is immediate and urgent.

We are not prepared in any way to dispute the correctness of the conclusions arrived at, and regret the difficulties which are thus clearly indicated as lying in the path of a "back to the land" policy and of its general and immediate development. A vista of contentious political questions is at once opened up. Can increased wages and better housing accommodation be provided by agriculture from its own resources, or would it be necessary to compass the desired result by means of State subsidies or protective measures at the expense of the community in general? The columns of THE LANCET are not adapted to the discussion of

such topics, and we can only record our opinion that "on grounds of national expediency" an extensive re migration of the urban population to rural districts is greatly to be desired. It should find there the opportunity to live a healthier life than is possible in our great cities, but it will not find it easy to accumulate wealth, and there will be little in the way of the amusement to which it is accustomed to tempt it to remain. It should by its labours increase the food supply of our cities and thus afford a better chance of healthy life to the workers remaining in them. This in itself would tend to compensate the country for an expenditure. The difficulty, however, of discussing questions of this kind is great on account of the uncertainty as to what the position of our great trades and manufacturing industries will be when peace comes, and as to the temptations which they will be able to offer to their workers to remain with them.

A GERMAN DOCTOR'S EXPERIENCES IN LONDON DURING THE WAR

Dr J P zum Busch has contributed to the *Deutsche Medizinische Wochenschrift* his experiences in England during the past two years. He is a medical graduate of Freiburg and a Member of the Royal College of Surgeons of England of many years' standing, and was for over 22 years prior to the war honorary surgeon to the German Hospital in London. He remained at his post until the beginning of May of this year. At the outbreak of the war, while the work of the hospital was much increased, the staff became more and more limited by resignations. At the same time the number of occupied beds was increased from 160 to 200. Dr zum Busch became himself resident at the hospital in order to assist with the pressure of work, especially at night. He states that after labouring continuously for a year and three quarters, during which time he 'saw no green field' (his passport limiting him to a radius of 8 kilo metres), he was interned at Stratford at three days notice and repatriated on June 21st, owing, as the editor of the *Deutsche Medizinische Wochenschrift* alleges to representations made by himself, this being an entirely gratuitous and unlikely assumption. Dr zum Busch has for many years contributed letters on current affairs in England to the German journal, and this latest communication is entitled "My last letter from England." He naturally writes with considerable freedom to a circle of readers whom he knows to be sympathetic. He describes the disabilities under which the hospital laboured, criticises the restrictions imposed upon its work, and gives a vivid picture of the life in an internment camp, as he himself experienced it. Dr zum Busch states that life would have been quite insupportable for him if he had not found constant comfort in his work and in the marks of kindness and affection shown him again and again by his good English friends. But he records with feeling that on the occasion of his internment no word of regret reached him from the management of the hospital for which he had laboured so long. The editor of the *Deutsche Medizinische Wochenschrift*, who contributes from week to week caustic editorial comments on the general as well as the medical aspects of the war, dots his colleagues' list to some purpose and expresses the conviction that his last English letter will remain as documentary evidence of "British humanity and gratitude."

ACUTE POLIOMYELITIS

THE official weekly bulletin of the New York City Health Department for July 22nd has just reached us, and confirms the existence in New York of an epidemic of poliomyelitis which the telegrams have already foreshadowed. Attention in this country has been called to the epidemic by the distressing news that the daughter in law of the American Ambassador in London has succumbed to the complaint. For the week ending July 15th, 933 cases of poliomyelitis were notified, being considerably more than the sum of notifications of diphtheria, measles, and scarlet fever. During the same week 169 deaths occurred, as against 52 from all other infectious diseases. 143 of these were under 5 years of age, 25 between 5 and 15, and only 1 above this age. Of the 169 deaths 109 were boys and 60 girls. The bulletin contains information for the public regarding the disease and suggestions how to guard against it. Amongst the latter are contained the injunctions "Keep your children by themselves as much as possible, do not allow them to visit stuffy moving picture shows or other places where there may be a large gathering of children. Children should not be kept in the house, they should be out of doors as much as possible and not in active contact with other children of the neighbourhood. Do not take your children with you when you go shopping, do not allow your children to be kissed. Remember that children need fresh air in the summer time, and outdoor life is one of the best ways to avoid disease." The bulletin adds that it is perfectly safe for the children to frequent parks and playgrounds if only two or three of them play together, but that they should not play in large groups and should not come in contact with children from other parts of the city. These measures contain nothing new, but are instructive as being the advice of a public health department in view of an unprecedented outbreak. For the instruction of medical men a number of clinics have been arranged at the various hospitals of the city, in many cases daily demonstrations being given.

IN HONOUR OF VERDUN

"A Tribute in Honour of France, July 14th, 1916, is a pamphlet describing how France obtained Metz and Verdun, written by Sir Henry Morris, and sold for the benefit of the Red Cross Fund by Messrs John Bale, Sons, and Danielsson. The pamphlet arose out of a correspondence in the *Times* alluding to the eating of the bodies of the slain during the siege of Breisach in 1638. A quotation was made by a correspondent from 'Professor Blackie's Letters,' published in 1910, alleging that Metz was stolen from Germany some 200 years ago by Louis XIV. Sir Henry Morris, in a reasoned reply, compares the history of Metz and Breisach and shows that Professor Blackie made a mistake. Further, he gives concisely the early, medieval, and modern history of Metz, and describes how France obtained Verdun. The statement is often made that in 1552 Metz was treacherously taken possession of by the French, and that although Charles V besieged it the French kept it till it was ceded to them formally in the year 1648 by the Peace of Westphalia. It is not clear what is meant exactly by the word 'treacherously' in this connexion. Our notion of national patriotism has been of gradual growth, and there is no doubt that in the sixteenth and seventeenth centuries

many cities still retained such pride in their own independence and importance that their individual history was altered by their attitude towards their big neighbours. Sir Henry Morris's historical note is most interesting, and will be read by many now that the word Verdun is not only on all our lips but speaks to our warmest feelings.

THE METROPOLITAN WATER-SUPPLY

DURING the month of May the mean rainfall over the Thames basin was 2.06 inches, which represents 0.10 inch above the average mean rainfall for this month during the previous 33 years. With increased rainfall there is generally shown to be a deterioration in the chemical quality of the raw river waters in some respects. The results of the chemical examination during May showed that the raw Lee water deteriorated as judged by the albuminoid nitrogen, permanganate, and colour tests but there was no change with regard to its turbidity. The raw Thames and New River supplies similarly deteriorated in quality as judged by the albuminoid nitrogen tests, but improved as regards the permanganate, turbidity, and colour tests. The samples collected at the different works were, generally speaking, clear, bright, and free from suspended matter, the filtered waters in fact showing an improvement in quality during the month as judged by the albuminoid nitrogen, permanganate, and colour tests. All three raw waters contained more bacteria than their respective averages, while the filtered waters, generally speaking, yielded not unsatisfactory results, as will be seen from the following statement. Whereas 78.3, 86.9, and 34.8 per cent of the samples of raw Thames, Lee, and New River water respectively contained typical *B. coli* in 1 c.c. (or less) of water, 90.9, 60.9, and 93.9 per cent of the filter water derived from these supplies (placing them in the same order as above) contained no typical *B. coli* even in 100 times as much water—namely, 100 c.c.

CHINA AND WESTERN MEDICINE

NATIVE medical practice in China is still founded on Taoism, which became in the hands of its later interpreters a quest for a kind of philosopher's stone to induce long life. The text books are those of a thousand years before the Christian era, and nothing of modern application, except perhaps acupuncture, has emerged from them. It now appears that the medicine of the Western world is beginning to take firm root, a fact to which fresh testimony is borne by the holding of the first annual conference of the National Medical Association of China, of which we publish a report in another column. The report is belated, but the postal facilities of the world have been much curtailed of late, and the internal condition of China very disturbed. The free interchange of thought and opinion has largely homogenised thought and practice in this country during the last half century, and international conferences had begun to do the same for Europe before the war broke out, for it had already become possible for a student with a smattering of a foreign tongue to spend with advantage one or more semesters at a university other than his own without finding the medical and surgical practice too foreign for him to assimilate. The foundations of similar things are now being laid in China, and, if recent experience does not mislead, the superstructure is likely to rise rapidly. Dr Yen, in his

presidential address to the association, spoke of some of the public health problems to be faced in China, which are seen to be the same wherever the culture of the occident has penetrated. The consumption of alcohol and of patent medicines seems fated at first to rise as the level of civilisation, in our modern conception of the word, rises. It is discreditable to Western pioneers that this should be so, and we trust that China may find a short way of dealing with the evils. Allusion was made at the conference to many familiar Western problems. It was stated, for instance, that an attempt to train the old-fashioned nurse to become a clean and efficient midwife had failed in China. The institution of a State Medical Service to meet the necessities of public and private practice was proposed, and it is possible that in a country with no old conceptions of medical practice, and no vested interests, as we understand them, the drastic principles of such a service might be adopted with greater ease than they can be in this country.

METROPOLITAN HOSPITAL SUNDAY FUND

THAT in spite of the heavy demands made on the purses of the charitable in connexion with the war, and in spite of the vast increase in the cost of living, the sum collected by the Metropolitan Hospital Sunday Fund should have fallen short by only £2600 of last year's total is a great satisfaction to the supporters of this valuable charity. The actual sum collected for the current year up to the meeting of the Council on Tuesday last was £68,000, of which £66,430 will be distributed among 248 hospitals, convalescent homes, dispensaries, and nursing institutions, 7½ per cent of the total being applied to the purchase of surgical appliances. On the motion of Lord Knutsford, the General Purposes Committee were empowered to consider the advisability of having a fixed date for Hospital Sunday during the winter months, on the ground that a better response to the appeal would result at that season of the year.

THE BOARD OF SCIENTIFIC SOCIETIES

ON the initiative of the Royal Society a Board of Scientific Societies has been established for the furtherance of the following objects: Promoting the coöperation of those interested in pure or applied science, supplying a means by which the scientific opinion of the country may, on matters relating to science, industry, and education, find effective expression, taking such action as may be necessary to promote the application of science to our industries and to the service of the nation, and discussing scientific questions in which international coöperation seems advisable. The Board at present consists of representatives of 27 scientific, including technical, societies. The regulations give power to add to this number and to appoint as members of subcommittees individuals who are not necessarily connected with any of the constituent societies. An executive committee has been appointed consisting of the following members: Sir Joseph Thomson, O.M., P.R.S. (chairman), Dr Dugald Clerk, F.R.S., Sir Robert Hadfield, F.R.S., Mr A. D. Hall, F.R.S., Professor Herbert Jackson (honorary secretary), Sir Alfred Keogh, K.C.B., Sir Ray Lanester, K.C.B., F.R.S., Professor A. Schuster, Sec. R.S.S., John Snell, Professor E. H. Starling, F.R.S., Lord Sydenham, F.R.S., and Mr R. Threlfall, I.P.S.

THE SHIAH PILGRIMAGE AND THE SANITARY DEFENCES OF MESOPOTAMIA AND THE TURCO-PERSIAN FRONTIER

BY F G CLEMON, M D EDIN, C M G,

BRITISH DELEGATE TO THE INTERNATIONAL BOARD OF HEALTH AND
PHYSICIAN TO H.M. EMBASSY CONSTANTINOPLE.

III.—THE SANITARY DEFENCES ON THE TURCO-PERSIAN FRONTIER.

THE total length of the Turco-Persian frontier from the neighbourhood of Mount Ararat on the north to the Persian Gulf on the south is approximately 800 miles. The greater part of this line—all indeed, except a short portion at the southern extremity—passes through highly mountainous country inhabited by nomadic or semi nomadic Kurdish and Arab tribes. The mountains rise in many places to 10,000 or 12,000 feet and are only crossed at long intervals, by certain more or less well-defined routes of communication between the two countries. In the report of the Commission of Inspection a careful study was made of the principal of these routes of the various tribes living on or near to the frontier line, of their seasonal migrations and of the through movement of passengers and pilgrims from one country to the other. Unfortunately, the manuscript of this chapter of the report was not saved with the other papers, and is still in Constantinople and it cannot be fully reconstructed here. The following statements may, however, be made.

Firstly as regards the northern third of the frontier from Ararat southwards to Shemdinan the sanitary defences were dealt with by the earlier Commission, that of July 1911 already mentioned in the first of these articles. That Commission found that the sole lazaret in this region, that of Kizil Dizé near to Bayazid, was in a deplorable condition and recommended the construction of a proper sanitary station there and of four secondary stations elsewhere.

In the southern two-thirds of the frontier apart from the many minor routes of communication already referred to, there is but one great line of through traffic—that which passes from Kermanshah in Persia through Kasr-i-Shirin to Khanikin on the Turkish side of the frontier, and thence, through Kizil Robat Shahraban and Bakuba, to Bagdad. As compared with this line all other routes are of minor significance. Along many of them no doubt there is a considerable amount of movement of passengers and goods but it is mainly of a local character and the quantity of what may be called long distance through traffic by these routes is apparently very small indeed. In this local movement are included the seasonal migrations of the Kurdish or other tribes already alluded to. Practically the entirety of the Shiah pilgrim traffic from Persia to the holy places of Mesopotamia passes by the Khanikin route.

Along this part of the frontier the only existing sanitary defence consists of a lazaret at Khanikin and of health offices at Rayet Suleimanieh and Mendeli, an office formerly existing at Revanduz was done away with a few years ago. The personnel of these offices consisted solely of sanitary clerks and sanitary guards mounted or on foot whose main duty it was to collect the sanitary tax of 10 piastres¹ (about 1s. 8d.) on all persons and of 50 piastres on all dead bodies entering Turkey from Persia and of endeavouring to prevent "contraband in dead bodies—a subject to be dealt with later. Scarcely as these sanitary defences may seem for so such an immense length of frontier the Commission did not propose to create any new lazarets or sanitary stations save at Mendeli near the southern end of the line where there is a considerable through movement of both persons and dead bodies and where it was proposed to create a small observation and disinfection station.

It was not recommended to establish new stations at other points as it was held that on the one hand the danger to public health offered by the small amount of through traffic along the various minor routes was not very great and that on the other any attempt to subject to proper sanitary control the nomadic tribes in their seasonal migrations was foredoomed to failure, while the practical obstacles in the

way of establishing sanitary stations in these remote and mountainous districts would have been exceedingly difficult to overcome.

Many of the names mentioned above have recently become familiar to the general public, and will become still more so as the war progresses. The arrival of Russian forces at Revanduz was announced some time ago, the Russo-Turkish battle line has recently swayed between Kermanshah and Khanikin, and we all hope to see the Russian army descend from Khanikin to Bagdad by the route already mentioned. That route is, and has been in the past one of the principal lines of military invasion and in like manner it has been the most frequent route by which epidemic disease has passed from Persia to Turkey or from Turkey to Persia. The Khanikin lazaret has been Turkey's sole defence against the former danger, Persia on the other hand, has had no lazaret upon her side of the frontier though of recent years she has projected the construction of one at or near to Kasr-i-Shirin. Disease has as frequently passed in one direction as in the other as will be seen from the following brief summary of the history of cholera and plague in the frontier region.

The Frontier as a Channel of Importation of Disease

In the first great pandemic of cholera that of 1819-22, the disease was imported to the Tigris valley and in the autumn of 1821 passed into Persia, as the result of a war between Turkey and Persia. In 1851 cholera was imported from Bagdad to Suleimanieh and Revanduz on the frontier and in the following year was epidemic on both sides of the frontier line. In 1856 the disease was epidemic in Persia, from Kermanshah it spread to Khanikin where as also on the road between Khanikin and Bagdad, the pilgrims suffered terribly, and later they carried the infection to Bagdad, Kerbela, and the Euphrates valley. Cholera followed a similar route in 1860. In 1861 it was imported from Persia to Mendeli and Bakuba, and thence to Bagdad, Kerbela, and Nejeff. In 1865 it appears to have crossed the frontier from Turkey into Persia, near Suleimanieh. In 1867-69 the disease was epidemic in Persia and is said to have crossed the frontier into Turkey from Kermanshah. In 1893 cholera appeared in Mendeli and in Khanikin and as it was already epidemic in Persia it was probably imported from there. In 1904 the epidemic whose course from Syria to Mesopotamia in 1903 was traced in the preceding article, was apparently introduced into Persia from Turkey and caused an excessively severe and fatal epidemic there. In subsequent years cholera was frequently epidemic in Russia and occasionally spread thence into Persia and Turkey in Asia, and in 1910 it once more passed down from Kermanshah, through Khanikin to Bagdad.

During the latter half of last century plague was as stated in the preceding article endemic and sometimes epidemic, at places in the Euphrates valley and on both sides of the Turco-Persian frontier. On the Turkish side the principal outbreaks occurred in the Hindieh marshes along the lower Euphrates, about Djaara and Shenafieh in Nejeff, in Bagdad, at Bedra Zorbatia and Mendeli near the southern end of the frontier and among the Muntefik tribes. On the Persian side there were outbreaks of the disease at Maku near Lake Urmiah and near Hamadan at Saouj Boulak, Jivanrao, Merivan Uzander, Mahideshte and other places along the frontier line. The important fact to notice, however, is that, while the infection was occasionally carried from one side of the frontier to the other the result was always confined to a localised epidemic and the disease has shown no tendency to spread from the centres named to other parts of the world.

The Khanikin Lazaret

The utility and necessity of this institution will readily be realised from what was said above as to the overwhelming importance of the Khanikin Bagdad route, as compared with all others that cross the frontier. This necessity will become still greater in future if the various schemes put forward for railway development in Turkey and Persia are realised. Of these the most important in the present connexion will be the proposed extension of the Bagdad Railway to Khanikin and Kermanshah. This will start from the main line north of Bagdad but at Samelkha 60 kilometres north of Bagdad. It will cross the Tigris and ultimately join the usual caravan route at Kizil Robat whence it will pass to Khanikin and Kermanshah. Meisner Pasha the chief engineer of the

¹ Parts I and II were published in THE LANCET of August 12th 1916.
² A Turkish piastre is the value of 20

Bagdad Railway (and formerly of the Hedjaz Railway), informed me that this line is planned to pass quite close to—within 300 metres of—the present lazaret at Khanikin, there will, therefore, be no need to transfer the lazaret from its present admirable site.

Other projected railways are destined to increase still further the importance of the Khanikin lazaret. The principal of these will be the line, already partly opened, connecting Julfa on the Russo-Persian frontier, the terminus of the Tiflis-Julfa railway, with Tabriz, Hamadan, and Kermanshah. The opening of these new railways will certainly increase very considerably the number of Shiah pilgrims coming from Persia, the Caucasus, and Central Asia to the Shiah holy cities of Mesopotamia. This expectation is based on many precedents. Thus among the many striking effects of the opening of the Trans Siberian Railway at the end of last century was a very marked increase in the number of pilgrims to Meshed, in northern Persia, close to the Russian frontier. There is a famous Shiah shrine here, over the tomb of Imam Riza, which has always attracted many pilgrims, and which will be referred to again in the following article. Notices in the local languages were hung in the principal stations of the then new railway, and special reduced fares were offered to Shiah pilgrims, with the result just stated. So, too, the opening of the Hedjaz Railway, which was completed as far as Medina in 1908, has led to a large increase in the number of pilgrims travelling from Damascus to Medina. Other examples of a like nature could be quoted from India and elsewhere.

But the opening of the new and projected railways in Persia and Mesopotamia may be confidently expected to increase not only the number of Shiah pilgrims to Kerbela and Nejef, but also the number of Moslem pilgrims proceeding to Mecca and Medina, in spite of the distances involved. For with the opening of these new lines such pilgrims will be able to travel by rail from their homes in these Asiatic provinces direct to Medina. A glance at the map will show that they could take train by the new Persian railways to Kermanshah, thence by the Bagdad extension line to Bagdad, and thence by the main Bagdad line to Aleppo. From there a line connects, through Homs and Hama, with Damascus, and from Damascus the Hedjaz Railway runs for 800 miles, through "the desert and the sown," to Medina, and may ultimately be extended to Mecca. The great importance of these railways from a public health point of view, and the increased danger of the spread of epidemic disease by their means are obvious, more particularly as the majority of passengers will be pilgrims, a class by whom disease has so often been spread in the past and for whom specially strict measures are always required under the International Sanitary Conventions.

Some idea of the number and nationality of persons passing through the Khanikin lazaret may be gathered from Table I.

TABLE I

Year	Persians		Russians		Turkish		Indians		British		Barbaris		Afghans		Total	
	P	N	P	N	P	N	P	N	P	N	P	N	P	N	P	N
1909-10	21 023	1591	1726	188	352	14 9	2	—	—	—	—	—	182	57	25 460	1862
1910-11	42 808	4941	1762	193	3659	27 6	4	—	—	—	—	—	129	66	48 364	2331
1911-12	20 450	2173	896	90	2387	4	—	—	—	—	338	131	61	6	24 632	2407
1912-13	26 967	6613	1111	125	1428	10 2	—	—	—	—	—	—	43	3	29,554	5751

P = paying N = non paying. The "non paying" include children under seven and persons pleading indigence who were exempted from the sanitary dues.

These figures, however, can only be regarded as approximately correct. Many pilgrims and passengers, it is believed escape registration, and the nationality of those registered is often very imperfectly ascertained. Thus the numbers of "Persians" should probably be less than appears in the table, and those of "Russians" greater since there appears to have been a tendency to register all persons coming across the frontier as "Persians."

In addition to passengers and pilgrims a large number of dead bodies on their way to the holy burying grounds of Kerbela and Nejef, annually pass through the Khanikin

lazaret. The number and nationality of these bodies during the years 1909-14 are shown in Tables II and III.

TABLE II—Number of Dead Bodies Arriving at Khanikin

Year	March	April	May	June	July	Aug	Sept	Oct.	Nov	Dec	Jan	Feb	Totals
1909-10	1517	18	8	20	43	436	414	1933	585	29	43	3572	
1910-11	2877	137	83	130	582	600	1043	2139	103	20	3	4322	
1911-12	656	75	16	68	338	148	450	695	245	77	4	2338	
1912-13	54	9	22	26	18	179	229	1939	17-9	248	23	4-39	
1913-14	16	3	10	19	56	164	93	1532	1724	371	33	19	4-51
Averages	2432	52	30	63	261	302	1076	1639	311	35	22	3300	

TABLE III—Nationality of Bodies Arriving at Khanikin

Year	Afghans	Russian	Persian	Turkish	Totals
1909-10	7	1084	2463	13	3572
1910-11	4	930	4024	24	4962
1911-12	3	487	1908	—	2398
1912-13	—	1258	3241	—	4499
1913-14	—	1234	2817	—	4051
Averages	2.8	938.6	2891.6	7.4	3900.4

From these tables it will be seen that an average of 34,000 travellers and 3900 corpses pass through Khanikin every year. The monthly table shows also that the movement of dead bodies—and the same is true of living persons—is at its highest in the months from August to December and at its lowest from January to July. This seasonal variation will be referred to again in a later article, dealing with the Shiah pilgrimage.

Hitherto the sanitary office and the lazaret at Khanikin have been two separate establishments, situated at some distance from each other. Pilgrims and passengers with their pack animals, flocks, and dead bodies, were directed to the former when there was no epidemic disease in Persia, and to the latter when there was. The "office" consisted of a large caravanserai of the usual type found in these regions—that is to say, of a series of arched recesses and enclosed chambers, built round the sides of a large square enclosure. It was here that the sanitary taxes were collected and the dead bodies inspected. It should be explained that for many years past no dead bodies were admitted to Turkish territory if death had occurred at least three years before and the bodies been reduced to the skeleton state (*en état d'ossements*). Attempts at contraband—to be discussed more fully in a later article—have, however, always been frequent, in order to avoid the payment of the sanitary dues. When detected at Khanikin, the bodies were confiscated and kept in a special depot prepared for the purpose until claimed by the relatives or bearers, when they were delivered up on payment of the dues. All bodies found to have been buried less than three years ("fresh" bodies) were seized and buried in a cemetery situated some 200 metres from the office. The Commission proposed to do away with this sanitary "office" altogether and to concentrate the entire sanitary service in the reorganised lazaret. An annual rental of P 20 000 (£166) would thus have been saved to the Turkish Government.

No attempt will be made here to give a detailed description of the Khanikin lazaret as the Commission found it. It occupied an excellent site a short distance from the eastern side of the town and close to the road or track coming from the Persian frontier. The site measured 530 metres in length and 160 metres in width making a total area of 84 800 square metres. It had once been surrounded by a wall but nearly all traces of this had disappeared. On this vast site there were only two buildings. The one consisted of a large porch with two wings containing a series of rooms built some 40 or more years ago by the greatest Turkish statesman of modern times, Midhat Pasha, when he was Vali of Bagdad. It was extremely solidly built and though in a bad state of repair it was proposed to consolidate it and incorporate it in the plan of the new lazaret. The other building was a disinfecting pavilion. Though constructed comparatively recently it had been so badly planned and built of inferior material that the Commission saw no other course open but to recommend its demolition and the construction

of a larger and better pavilion on another portion of the site

Complete plans and estimates for a practically new lazaret were prepared, from the Commission's indications, by a French architect, who accompanied the Commission from Bagdad to Khanikin. These are, of course, omitted here. The plan comprised firstly a large enclosure, where the collection of dues and "revision" of corpses would take place, whether plague or cholera was or was not epidemic in Persia at the time. In ordinary times the passengers would not go farther than this enclosure, but if plague or cholera were present in Persia they would pass to the disinfecting pavilion to be erected in an adjoining enclosure. The rest of the site would have been occupied by a series of "cordons," by hospitals for infectious and non-infectious cases, by houses for the lodging of better class passengers, by residences for the doctors and staff, and by the various other accessories of a properly organised sanitary station.

Land quarantines have, of course, been long since condemned by the International Sanitary Conferences, and this station was intended to be occupied solely by groups of passengers among whom a case of cholera or plague had actually occurred. Certain special conditions obtaining at this land frontier had to be taken into consideration and provided for in the plan of the lazaret. Thus the greater number of the groups of travellers arriving at Khanikin are accompanied by many animals—such as horses, donkeys, camels and others. It would be practically impossible to separate them from these animals. Any attempt to do so would lead to extreme confusion and acute quarrelling as to the ownership of the respective animals, and a special staff would be required for feeding and watering the latter if they were quartered apart from their owners. Consequently both in the enclosure for the "revision" of bodies and in each "cordon" it was proposed to have long hangars 10 metres wide and other special arrangements for the accommodation of the animals. It was freely admitted that such an arrangement is very far from ideal, but it was realised that, apart from the practical difficulties in the way of separating the animals from their owners, an attempt to do

FIG 3

Shiah corpses approaching Nejei

so would probably lead to the open revolt of the latter, thus rendering impossible the application of further sanitary measures.

A few words may be said as to the systems of water supply and of excreta disposal which it was proposed to adopt in the new lazaret. The water would continue to be taken as in the past, from a small stream, known as the Hadji Kara Sou, which flows near the west side of the lazaret site, at a distance varying from 30 to 80 metres. This stream rises in the river El Wend upon which the town of Khanikin is built, at a point well above the town, and at a distance of about six kilometres from the lazaret. The El Wend is a branch of the Diala river which again, is a branch of the Tigris into which it flows a few miles south of Bagdad. The water of the Hadji Kara Sou is of the usual impure character found in these regions, and arrangements for its purification before distribution similar to those proposed for the Basra lazaret, and briefly described in the preceding

article were also proposed for this lazaret.

As at Basra, it was recommended to have a series of trough closets in all parts of the lazaret with automatic flushing tanks and drains leading to *fourtes a fond perdu*. These would be placed well outside the lazaret enclosure and on the opposite side from the source of the water supply. The soil here is composed of sand and gravel, and would it was thought, lend itself to this system of excreta disposal. It was intended to construct without delay the greater part of the new buildings provided for in the plan, while leaving space for certain additional "cordons" and buildings to be put up if, after the opening of the new railways, additional accommodation for pilgrims and passengers were found to be necessary. The estimated cost of the works to be put in hand at once was 17 000 Turkish liras (or £15 300 sterling), and that of the additional works about £2000 making a total estimate of £19 000 (or £17,100 sterling). These sums would have been taken from the £250 000 which, as explained in the opening article had been voted for the reorganisation of all the Turkish lazarets.

(To be continued.)

NATIONAL MEDICAL ASSOCIATION OF CHINA

THE FIRST ANNUAL CONFERENCE AT SHANGHAI

TUESDAY, FEB 8TH

THAT Western medicine is making rapid headway in the ancient land of China is shown by the following account of the first conference of the National Medical Association of China which was held in Shanghai last February. It may interest our readers to learn that the secretary (now President) and moving spirit of that Association is Wu Lien Teh, M D Cantab, well known to many English friends as Dr G L Tuck. The international postal difficulties existent just now, as well as the political unrest of China, are illustrated by the fact that the report of the meeting has reached us so late.

The following were the original officers of the Association: F C Yen, M D D T M, President, Wu Lien Teh, M A M D, secretary, E S Tyan M D, D P H, treasurer, Way Sung new, A B M D, was the secretary of the conference, and Dr T K M Siao and Dr J H Liu were the associate secretaries.

MONDAY, FEB 7TH

The first day's session was held in the Martyrs' Memorial Hall, Shanghai. There was an attendance of 55, a considerable number of the delegates being from other cities.

Dr YEN, in his presidential address, after welcoming the members present, and expressing gratification that the attendance was sufficiently large to insure the success of this the first annual conference of the Association dealt with various matters connected with the work of the Association, and urged that all should work as a united body for the best interests and welfare of the medical profession. He advised that their efforts be concentrated on a few undertakings which can best be done by Chinese, or on work which foreigners were prevented from doing. Their own time could be better spent in spreading medical knowledge than in research. It was more important for them to translate medical books than to write articles for foreign medical journals.

Dr IDA KAHN (Nanchang) read an instructive paper on Hygiene in the Home. Beginning with the choosing of the site of the house, the lecturer went on to consider its construction, furnishing and equipment from a sanitary standpoint, and its sanitation, concluding by showing the adaptation of these things to family life and duties.

Dr WU LIEN TEH (Harbin) followed with a paper on the Foundations of Modern Hygiene in China. He stated that regulations for the preservation of good health were published in China as far back as B C 700. Nevertheless, for many centuries the adoption of progressive ideas to cope with existing problems had not made enough headway, a fact which was especially noticeable at the present time in the matter of the prevention of infectious disease, which might be regarded as the essence of modern hygiene.

Dr W W PETER, of the Council on Public Health of the China Medical Missionary Association, spoke on Preventive Medicine, discussing the paper read.

In the evening Dr YEN gave a public lecture on the Duties of the Medical Profession, first to the public and then to the profession itself. He spoke of the appalling consumption of alcohol and tobacco, the spread of disease by the careless use of common towels and eating utensils, the tremendous death roll, and the folly and extravagance of parents spending \$2000 in two months for worthless Chinese medicine for an infant whose life would have been saved had a physician been called. The lecturer devoted considerable time to an exposure of the worthlessness and harmfulness of the varieties of patent medicines that are being shipped to China by the ton. Chinese dispensaries all over China are largely stocked with these imported articles, and even Chinese drug dealers themselves instead of devoting their energies to manufacturing pure drugs, are from year to year increasing their output of Chinese made patent medicines. Some of the large shops in Shanghai handle scores of these "medicines," the claim being made for one medicine that it was able to grow a new foot to replace one that had been injured in infancy.

Dr LUJEN TSAO (Nanking) read a paper on Medical Education of Nurses. She outlined the history of nursing in China, and mentioned the frequency of meeting nurses who were uneducated and even illiterate who did not know how to count the pulse and who distinguished medicines by the colour of the ingredients. But these days she said were passing, a new generation of nurses having come into being, the great incentive for this lying in the training of a better class of women, who often belong to the best families. She detailed two important spheres of work for nurses—namely (1) in social service, where they could teach the people the application of modern hygiene to householders, and (2) in the promising work of midwifery. In regard to the latter, she regretted to say that an attempt to train the old fashioned ignorant nurses in modern cleanly ways had failed and she came to the conclusion that midwives must be trained from the beginning, if in America 20,000 women died yearly from the effects of child bearing, the number must be very much larger in China.

In the absence of Dr S P CHEN (Peking) superintendent of the Peking Isolation Hospital a paper in his name was read by Dr ABEL TANG. Dr Chen classified the medical schools of China into those founded by the Government and those founded by missionary societies. He supported the proposal to have a uniform system of nomenclature in Chinese. In the meantime the English language should be used, but German should not be discouraged. A general examination should first be passed, and he proposed the following measures: (1) Establishment of a Central Board of Control, (2) reorganisation of existing schools, (3) well equipped hospitals, and (4) provision for post graduate study.

Dr J W H CHUN (Harbin) sent a paper on Medical Education which was read by Dr E B YOUNG (Changsha). He gave the latest obtainable list of medical colleges and referred to the scheme of the Rockefeller Foundation by which the education of medical students and nurses would be improved.

Dr J H LIU (Shanghai) read a paper on the same subject, in which he discussed whether the Chinese Government and people should go ahead independently of the foreign institutions. However extensive the schemes of the Rockefeller Foundation may be, he insisted that the Chinese must do things for themselves. He proposed that the conference should pass a resolution to the Board of Education urging the Government to improve the state of medical education in the country.

The foregoing papers were discussed by several foreign doctors who have devoted years of work in China to teaching Chinese students, and who took occasion to express the pleasure they felt at seeing so many men, once their pupils, now qualified physicians.

Mr O J DAVENPORT (Shanghai) said this conference was being held at the psychological moment for medical education in China. He appealed to Chinese doctors to have the proper spirit in treating the sick and suffering and not to think only of getting rich through the profession.

Dr H S HOUGHTON, Dean of the Harvard Medical School, discussed the scope of medical education. First he said we must create a demand among the Chinese for modern medicine. Secondly, we must train nurses. Thirdly it is not wise to adopt in China a definitely crystallised curriculum. Rather should the habit of observation, critical scientific reasoning be developed among the students and a right spirit be conserved.

Mr D DUNCAN MAIN (Hangchow) spoke humorously on the need of providing physicians of the rank and file for dealing with disease in China.

Mr J G CORNACK, Principal of the Union Medical College, Peking, was pleased to hear from the Chinese speakers that they would try to develop medical science themselves and not depend entirely on the assistance of foreigners.

Dr MARY FULTON, for a long time Principal of the Hackett Medical College for Women in Canton and the first person to train lady doctors in China, emphasised the need of a Central Medical Board before which all practitioners should appear.

Dr J B NEAL, Principal of the Tsingtao Union Medical College and Dr GULLISON (Hangchow) spoke words of congratulation and encouragement to the Association.

In the evening Dr WU LIEN TEH gave a lecture on How to Live a Healthy Life. A large and appreciative audience was both entertained and instructed during the hour in which Dr Wu addressed them. As a Shanghai newspaper remarked if half of his hearers followed Dr Wu's excellent advice there would be much less work for the doctors.

WEDNESDAY, FEB 9TH

The session was opened by Dr C YOUNG YUI (Shanghai) with a paper on Medical Text-books and Publications in China. Dr Yui contended that the Chinese whether they have been educated in Europe, America, or Japan, should teach medicine in their mother language, he considered that only under exceptional circumstances should new characters be invented, as the Chinese language is already too difficult. In this respect Dr Yui said that he was not in full agreement with the matured opinion of the China Medical Missionary Association. Nor did he approve of the blind acceptance of Japanese terms by Chinese doctors. Many of the terms depend upon mere tones and he instanced characters representing typhoid fever, diphtheria plague, protoplasm and organic compounds. The difficulties in translation he said, lay in the great difference between the European and Chinese languages. Most doctors engaged in translation work had to depend upon Chinese literary men who know no science or upon scientific men deficient in both Chinese and foreign languages.

Dr ABEL TANG (Shanghai) also read a paper on Chinese Medical Books and Publications. He regretted that Chinese medical men, unless they are conversant with foreign languages, have to depend upon translations. No time should be lost in producing a Chinese official medical nomenclature.

The general discussion was opened by Dr NEAL (Tsinanfu) who agreed with the opinion expressed by Dr Yui and Dr Tang and assured his Chinese colleagues that the foreigner's work in China was only temporary, the wish is only to see medical education firmly established.

Dr LI (Peking) as a graduate from Japan explained the Japanese reasons for the adoption of their terms. Popular Chinese terms are not accurate enough, and one must be accurate in medicine above all things.

Mr CORMACK laid stress on simplicity clearness and elegance in the adoption of terms. He instanced the word 'nerve' which could be translated in Chinese as 'brain thread' and not as 'brain tendon'.

Dr WANG (Changsha) said that public opinion could not be overlooked, and nothing should be done unless the leaders of education approved. The missionary and national associations should unite with the well organised Kiangsu Educational Association to come to a decision and petition to Central Government.

Dr MCALL said that modern medical education may be compared to an infant which must and will grow, and the proper steps should be taken now for its development.

Dr W. H. VENABLE (Kashang) President of the China Medical Missionary Association gave a word of welcome to the conference.

In the evening Dr ARTHUR STANLEY (health officer Shanghai) gave a most instructive and interesting lecture on Quack Medicines in the course of which he deplored the fact that many foreign trained Chinese physicians in Shanghai were working in association with drug stores.

THURSDAY FEB 10TH

The fourth day's session began with a paper by Dr P. M. JEE (Tientsin) read by Dr CHOW on the Standards of Medical Practitioners in which he dealt with the difficulties attending the determination of a uniform standard for medical practitioners in China. Dr Jee supported the proposal for the establishment of a Central Medical Board under the auspices of the Peking Government.

Dr H. T. CHIAN (Tayeh) sent a paper on the Status of Medical Practitioners which was read by Dr W. P. CHUNG. In this paper medical practitioners in China were classified as follows: 1 The old fashioned native physicians whose only diploma was their signboard. 2 Nurses and assistants who had been trained in mission hospitals. These are a little better than the first group but some are for making money only and do not work for the benefit of humanity. This class, he said, are often guilty of criminal practices. 3 Graduates from Chinese Medical Schools are better trained practically though not well versed in the science of medicine. 4 Graduates from Japan. 5 Doctors properly

qualified in the colleges of Europe and America. Dr CHUNG pressed for the early establishment of a Central Medical Board for the registration of all practitioners. He urged the sending abroad of more students for the study of medicine, and said that the government should subsidise the existing medical colleges in this country.

In the discussion on 'Medical Standards,' Dr MERRINS (Shanghai) mentioned the ethical standards which should govern conduct of the physician individually, his attitude towards the members of his own profession and his relations with the State. In view of the ignorance of medical subjects and the poverty of the great mass of the Chinese people, he urged the need of establishing a State Medical Service which would give a settled position to medical men and enable them to exercise government authority in introducing and enforcing measures necessary for the public health.

Dr VENABLE emphasised the dignity and greatness together with the humanity and modesty, of the medical profession. He recommended the two grand words, 'I serve' as the motto that might be adopted.

Mr MAIN dwelt on the danger of placing money too much to the fore.

Dr WU LIEN TEH then read a paper entitled 'An Inquiry into Ancient Chinese Ideas of Treating Poisons.'

Dr PETERS subject in the evening was 'Health as a Factor in National Strength,' and the points he wished to emphasise were driven home with convincing force by the almost automatic working of many ingenious mechanical demonstrating devices and by maps and charts. At 8 o'clock there was a lecture by Dr HOUGHTON on Intestinal Parasites and their Ova which was illustrated by lantern slides from microphotographic plates.

FRIDAY FEB 11TH

On this the fifth day of the conference there was a further discussion on patent medicines in which Dr YOUNG (Changsha) and Dr ELI DAY (Shanghai) read short papers urging the members of the association to wage war against patent medicines and quackery.

Dr STANLEY, who joined in the discussion said that not only must the doctors fight against unnecessary drugging, but they must themselves refuse to prescribe any but drugs of known value.

The following ten gentlemen were elected the first honorary members of the association: Chou Hsueh hsi the Minister of Finance and Chu Chi chien the Minister of the Interior, both of whom have rendered considerable service in promoting medical science in China, particularly in connexion with the proposed new National Hospital at Peking; Dr Arthur Stanley health officer of the Shanghai municipal council; Mr Dugald Christie Medical College Hospital at Mukden; Mr Duncan Mann, Hangchow; Dr Douglas Gray, physician to the British Legation at Peking; Dr H. S. Houghton Harvard Medical School Shanghai; Dr W. W. Peter, Public Health Council of the China Medical Missionary Association; Dr E. H. Hume Hunan Yale Hospital, Changsha; Dr G. F. Morrison adviser to the late President Yuan Shih kai.

A letter was read from the China Medical Missionary Association inviting the National Association to hold a joint conference with it next year at Canton which was agreed to.

In the evening Mr ROGERS S. GREENE (the China Medical Board of the Rockefeller Foundation) delivered a very interesting lecture entitled 'A Layman's Impressions of Modern Medicine.'

SATURDAY, FEB 12TH

On this day the conference was brought to a close by the election of officers for the ensuing year and by the passing of various resolutions.

It is interesting to mention that during the conference it was announced that a Chinese National Hospital is to be established in Peking. It will be supported partly by Government and partly by private subscriptions from Chinese the organisers refusing foreign help. After six years of endeavour by Dr Wu a meeting was held at Peking in December last which was attended by leading officials. Mr Tsao Ju lin Vice Minister of the Foreign Office who had worked for the project indefatigably and who presided emphasised the urgent need of having a model hospital in the capital where all classes of Chinese could be treated in an efficient manner. The existence of

such an institution would not only serve as an object-lesson to the masses regarding the superiority of modern scientific medicine as compared with ancient empirical medicine, but would help in influencing other large cities in China to follow suit. Owing to the strong support of Mr. Chou Hsueh hsi, who had already promised \$100,000 of the \$300,000 required, and of the Minister of the Interior, who had offered a large piece of Government land in the west city for the purpose, they could say at last that their long-deferred scheme of a national hospital would soon be realised. Since the conference a contract had been signed for the construction of the hospital, and building is to begin at once. The plans have been drawn by Messrs Shattuck and Hussey an American firm of architects. The building will be in three storeys with a basement, and there will be accommodation for 50 first and second class patients, and 100 third class patients. Unusual interest has been taken in the hospital throughout the country, and subscriptions have been received from the south, Shanghai, Tientsin, and even Hong Kong.

The following lectures and demonstrations were also given during the conference. Properties and Uses of Radium, by Mr Ernest Heezfeld, Life Insurance Examinations, by Dr T. K. M. Siao, Preservation of Museum Specimens in Liquid Paraffin, by Dr Liu, and a Hygienic Chair and Table for the Use of School Children, by Dr Yui.

PARIS

(FROM OUR OWN CORRESPONDENT)

Treatment of Gunshot Wounds by Carrel's Method

M. Quénu recently made a report to the Surgical Society on 121 gunshot wounds treated by two Army doctors, MM. Hornus and Perrin, on Carrel's lines. He said that the results obtained bore testimony to the value of the method. Neither prompt treatment, nor perfection of appliances, nor quality of nursing was sufficient in itself to explain the results. The treatment consisted in laying the wounds freely open, removing foreign bodies and free sequestrums, and irrigating the surface with Dakin's liquid. The sterilisation—or at least the chemical lavage—was kept up by constantly renewing the supply of antiseptic fluid to the interior of the wound. When, after a period of days or weeks, the wound was found on bacteriological examination to be nearly or quite sterile, secondary suture of the wound was undertaken, or in cases where loss of substance prevented this a progressive approximation of the edges of the wound by means of a kind of corselet provided with hooks and elastic bands. MM. Hornus and Perrin had treated by this method 81 wounds of soft parts, 21 wounds with bony lesions, 7 with injury of both bone and joints, 6 wounds of joints without fracture, 3 wounds of the chest, and 3 burns. M. Tuffier communicated to the society at the same session the good results obtained by MM. Dehelly and Dumas by following Carrel. The 19 cases in which the method had been employed demonstrated the great probability of obtaining healing by first intention after secondary closing of gunshot wounds. The disinfection of severely contaminated wounds was shown to be harmless and efficacious. After M. Pozzi and Dr J. L. Faure had noted with satisfaction the revulsion of feeling in favour of Carrel's method, MM. Rautier and Hartmann stated their conviction that if all the details of the application had been known at first as they were now no objection would ever have been raised to the method.

Treatment of Contractures of the Jaws

M. L. Imbert, head of the medical service especially concerned with the plastic surgery of the face, has with the help of M. Réal studied a large number of cases of contracture of the jaws. They distinguish three forms—bony, cicatricial, and sclerosing, while four fifths of the cases at present belong to yet another form, hypertonicity of the masseters, not mentioned in the text-books. To overcome these contractures it is necessary to combine mechanic-therapeutic movements produced by means of a gag with continuous dilatation of the jaws directed against the tonic resistance of the masseters. Surprising results have thus been obtained.

The Removal of Projectiles from Wounds

MM. Chauvel and Sauvé have both made recent contributions on this subject. M. Chauvel has described the successful extraction of 250 projectiles with intermittent control by the X ray screen. He does not advise the removal of all foreign bodies, but those should be extracted which keep up suppuration or functional impairment or which from their position may injure a neighbouring nerve or vessel. Projectiles encysted in muscle, peritoneal cavity, or the interior of any viscus should be removed at the instance of the patient. M. Chauvel hesitates to touch projectiles situated in the lung near to the hilus, in the liver, or in the mediastinum, when intervention is a grave matter in its immediate or remote results, and also such as are encysted in bone or callus and well tolerated there. Removal in such cases often leaving troublesome fistulas. M. Sauvé reported to the Society of Surgery on foreign bodies extracted under three different conditions. In the first, he operated after localisation by a radiologist in his absence with fair results: 29 successes, 18 failures (35 per cent). In the second, the extraction was undertaken after marking out the position of the projectiles with the radiologist. The results were better: 124 successes, 9 failures (7 per cent). In the third when he operated with intermittent control by the X ray screen, M. Sauvé extracted 108 projectiles in 110 cases. The two failures could not be put down to the method. In each case the foreign body was intrapulmonary. One patient had an attack of syncope when the pleura was opened, and the operation was therefore abandoned. In the other case a piece of shrapnel was found embedded in the body of a vertebra and it was decided to leave it there. The question of intraosseous and periarthral bodies is of special importance. It is admitted that those lying within the joints cause serious impairment of function and should be removed. Discussion has centred round those situated within the bone. In general, projectiles in the diaphysis are well borne if there is no septic reaction. This is not the case with those lying in the epiphyses which often give rise to grave impairment of movement. M. Sauvé counsels their removal.

August 8th

THE BELGIAN DOCTORS' AND PHARMACISTS' RELIEF FUND

THE EXECUTIVE COMMITTEE

A MEETING of the Executive Committee was held on August 8th. Since the last committee meeting on June 8th the books of the society have been audited by Messrs. Crewdson, Youatt, and Howard, and the following cash statement issued—

Cash Account from Dec 1st 1915 to June 30th 1916

Receipts			Payments		
Dec 1st, 1915—	£	s d	June 30th, 1916—	£	s d
To balance as per last account	15,603	12 0	By relief	2,562	11 10
			„ clothes	57	0 10
			„ administration expenses	12	9 3
June 30th, 1916—				2,632	1 11
Donations	305	8 5	Balance at bank	£1,945	12 3
Interest received	528	3 10	Treasury Bills	13,810	2 4
			at cost	£11,864	10 1
Total	£16,442	4 3	Total	£16,442	4 3

The donations lately have been few and trifling apart from a (second) generous gift of £100 from the Society of Apothecaries. The total sum now received including donations interest on deposit and interest on Treasury bills, amounts to £19,508 13s 2d. £800 a month continues to be sent to Belgium, four such amounts having already gone and receipts received for three. The receipt for the fourth sum has not yet arrived—there is always a certain amount of delay in these documents. The expenditure in other directions has been low only £44 2s being spent on relief, £20 7s 4d on clothes and £7 6s on the repairing of instruments.

VITAL STATISTICS

VITAL STATISTICS OF LONDON DURING JULY, 1916

In the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases, it appears that the number of persons reported to be suffering from one or other of the 10 diseases specified in the table was equal to an annual rate of 4.9 per 1000 of the civil population estimated at 4,310,030 persons, in the three preceding months the rates had been 5.3, 4.7, and 4.8 per 1000 respectively. The lowest rates during the month were recorded in Kensington, Chelsea, the City of Westminster, Hampstead, the City of London, Battersea, and Wandsworth, and the highest rates in Shoreditch, Bethnal Green, Stepney, Poplar, and Greenwich. The prevalence of scarlet fever was slightly more marked than it had been in either of the two preceding months, this disease was proportionally most prevalent last month in Hammersmith, Shoreditch, Bethnal Green, Stepney, and Deptford. The Metropolitan Asylums Hospitals contained 1201 scarlet fever patients at the end of last month, against 1603, 1325, and 1256 at the end of the three preceding months, the weekly admissions averaged 163, against 190, 155, and 159 in the three preceding months. Diphtheria also was rather more prevalent than it had been in other recent months, the greatest proportional prevalence of this disease was recorded in St. Pancras, Stoke Newington, Holborn, Finsbury, Bethnal Green, Stepney, and Greenwich. The number of diphtheria patients under treatment in the Metropolitan Asylums Hospitals, which had been 1351, 1242, and 1313 at the end of the three preceding months, had declined to 1280 at the end of last month, the weekly admissions averaged 153 against 152 in each of the two preceding months. The prevalence of enteric fever showed but little variation from that recorded in the previous months, of the 37 cases notified during July, 7 belonged

to Wandsworth, and 3 each to Paddington, Islington, Stepney, and Bermondsey. There were 40 enteric fever patients under treatment in the Metropolitan Asylums Hospitals at the end of last month, against 39, 30, and 44 at the end of the three preceding months, the weekly admissions averaged 5, against 7, 5, and 7 in the three preceding months. Erysipelas was proportionally most prevalent in St. Marylebone, Hackney, Finsbury, Shoreditch, Bethnal Green, Stepney, Poplar, Bermondsey, and Deptford. The 13 cases of puerperal fever notified during the month included 2 in St. Pancras, 2 in Southwark, and 2 in Camberwell. The 23 cases of cerebro-spinal meningitis included 3 in Islington, 3 in Poplar, 3 in Southwark, and 2 each in St. Pancras, Bethnal Green, Stepney, Lambeth, and Battersea. Of the 18 cases of poliomyelitis 8 belonged to Hackney, 5 to Poplar, and 2 to Islington.

The mortality statistics in the table relate to the deaths of persons actually belonging to the several metropolitan boroughs, the deaths occurring in institutions having been distributed among the boroughs in which the deceased persons had previously resided. During the four weeks ending July 29th the deaths of 3545 London residents were registered, equal to an annual rate of 10.7 per 1000, in the three preceding months the rates were 17.2, 12.9, and 11.5 per 1000. The death rates last month ranged from 7.7 in Wandsworth, 8.6 in Hampstead, 9.2 in Kensington and in Greenwich, 9.3 in Lewisham, and 9.5 in Stoke Newington, to 12.5 in Shoreditch, 12.6 in Bermondsey, 12.7 in Southwark, 15.0 in Poplar, 14.2 in Finsbury, and 14.8 in Holborn. The 3545 deaths from all causes included 220 which were referred to the principal infectious diseases, of these, 61 resulted from measles, 14 from scarlet fever, 47 from diphtheria, 31 from whooping-cough, 4 from enteric fever, and 63 from diarrhoea and enteritis among children under 2 years of age. No death from any of these diseases was recorded last month in the City of London, among the Metropolitan boroughs they caused the lowest death rates in the City of Westminster, Hampstead, Wandsworth, and Woolwich, and the highest rates in Holborn, Finsbury, Poplar, Southwark, and Deptford. The 61 deaths

* Including membranous croup.

* Including membranous croup.

from measles were 36 fewer than the corrected average number in the corresponding period of the five preceding years, this disease was proportionally most fatal in Shore ditch, Stepney, Poplar, Southwark, Lambeth Battersea, and Deptford. The 14 fatal cases of scarlet fever were 2 below the corrected average number, and included 2 in Poplar and 2 in Lambeth. The 47 deaths from diphtheria were 11 above the corrected average, the greatest proportional mortality from this disease occurred in Islington, Finsbury, Poplar, Deptford, and Lewisham. The 31 fatal cases of whooping-cough were 25 below the corrected average, and included 4 in St Pancras, 3 in Islington, 3 in Poplar, and 2 each in Hammersmith, Hackney, Stepney, and Greenwich. The 4 deaths from enteric fever were 6 below the average, and belonged respectively to Stepney, Poplar, Wandsworth, and Greenwich. The 63 deaths from diarrhoea and enteritis among children under 2 years of age were 93 below the corrected average number, this disease was proportionally most fatal in Paddington, St Marylebone, Holborn, Finsbury, Bethnal Green, Southwark, and Camberwell. In conclusion it may be stated that the aggregate mortality in London last month from these principal infectious diseases was 41 per cent below the average.

HEALTH OF ENGLISH TOWNS

In the 96 English and Welsh towns with populations exceeding 50,000 persons at the last Census, 7543 births and 3508 deaths were registered during the week ended Saturday, August 12th. The annual rate of mortality in these towns which had been 11.1, 10.5, and 10.8 per 1000 in the three preceding weeks, fell in the week under notice to 10.6 per 1000 of their aggregate civil population, estimated at 17,312,295 persons for the year 1915. During the first six weeks of the current quarter the mean annual death rate in these towns averaged 10.8 per 1000, and coincided with that recorded in London during the same period. Among the several towns the death rate last week ranged from 4.0 in Swindon, 4.1 in Aberdare, 4.5 in Ilford, 5.6 in Burnley, and 5.8 in Gillingham and in Bath, to 14.5 in Great Yarmouth, 14.6 in Bootle, 15.2 in Middlesbrough, 15.4 in Cambridge, and 16.4 in Huddersfield and in Hull.

The 3508 deaths from all causes were 79 fewer than the number in the previous week, and included 266 which were referred to the principal epidemic diseases, against 221 and 228 in the two preceding weeks. Of these 266 deaths, 127 resulted from infantile diarrhoeal diseases, 54 from measles, 38 from diphtheria, 34 from whooping-cough, 9 from scarlet fever, and 4 from enteric fever but not one from small pox. The annual death rate from these diseases were equal to 0.8, against 0.7 per 1000 in each of the two preceding weeks. The deaths of infants (under 2 years) from diarrhoea and enteritis, which had been 46, 72, and 82 in the three preceding weeks, further rose to 127, and included 31 in London, 10 in Liverpool, 6 each in Birmingham and Leeds, and 5 each in West Ham, Nottingham, and Manchester. The deaths referred to measles, which had been 59, 64, and 53 in the three preceding weeks, were 54, of which 15 were registered in London, 6 in Sheffield, 5 in Liverpool, and 4 in Manchester. The fatal cases of diphtheria, which had been 43, 35, and 40 in the three preceding weeks, fell to 33, and included 8 in London and 3 in Manchester. The deaths from whooping-cough, which had been 42, 36, and 25 in the three preceding weeks, rose to 34, of which 7 belonged to London. The deaths attributed to scarlet fever, which had been 17, 9, and 14 in the three preceding weeks, fell to 9 and included 2 in Liverpool. The fatal cases of enteric fever, which had been 5, 5, and 14 in the three preceding weeks, fell to 4, of which 2 were registered in London.

The number of scarlet fever patients under treatment in the Metropolitan Asylums Hospitals and in the London Fever Hospital, which had been 1216, 1221, and 1173 at the end of the three preceding weeks, further fell to 1107 on Saturday last, 136 new cases were admitted during the week against 172, 171, and 121 in the three preceding weeks. These hospitals also contained on Saturday last 1269 cases of diphtheria, 178 of measles, 133 of whooping-cough and 35 of enteric fever, but not one of small pox. The 878 deaths from all causes in London were 57 below the number registered in the previous week, and corresponded to an annual death rate of 10.6 per 1000. The deaths referred to diseases of the respiratory system, which had been 93, 90, and 99 in the three preceding weeks, fell to 88 in the week under notice.

Of the 3508 deaths from all causes in the 96 towns, 197 resulted from violence, 351 were the subject of coroners' inquests, and 1030 occurred in public institutions. The causes of 22, or 0.6 per cent of the total deaths were not certified either by a registered medical practitioner or by a coroner after inquest. All the causes of death were duly certified in London and in its 14 suburban districts in Sheffield, Leeds, Bristol, Bradford and in 64 other smaller towns. Of the 22 uncertified causes 6 were registered in Liverpool, 3 in Birmingham, and 2 each in Manchester and Sunderland.

HEALTH OF SCOTCH TOWNS

In the 16 largest Scotch towns with an aggregate population estimated at 2,372,000 persons at the middle of this year 1052 births and 554 deaths were registered during the week ended Saturday, August 12th. The annual rate of mortality in these towns, which had been 11.2, 12.5, and 11.2 per 1000 in the three preceding weeks, rose to 12.2 per 1000 in the week under notice. During the first six weeks of the current quarter the mean annual death rate in these towns averaged 12.0, or 1.2 per 1000 in excess of that recorded in the large English towns. Among the several towns the death rate last week ranged from 6.1 in Falkirk, 8.6 in Perth, and 9.8 in Kilmarnock, to 14.9 in Motherwell, 16.6 in Kirkcaldy, and 16.8 in Greenock.

The 554 deaths from all causes were 46 in excess of the number in the previous week, and included 45 which were referred to the principal epidemic diseases against 37 and 36 in the two preceding weeks. Of these 45 deaths, 19 resulted from infantile diarrhoeal diseases, 11 from whooping-cough, 8 from measles, 5 from diphtheria and 3 from scarlet fever, but not one from small pox or from enteric fever. The annual death rate from these diseases was equal to 1.0, against 0.8 per 1000 in the large English towns. The deaths of infants (under 2 years) from diarrhoea and enteritis, which had been 7, 15, and 15 in the three preceding weeks, further rose to 19, and comprised 12 in Glasgow, 2 each in Edinburgh, Dundee, and Aberdeen, and 1 in Clydebank. The deaths referred to whooping-cough, which had been 3, 4, and 3 in the three preceding weeks, rose to 11, of which 9 occurred in Glasgow. The fatal cases of measles, which had been 17, 7, and 8 in the three preceding weeks, were again 8 last week, and included 4 in Leith. The 5 deaths attributed to diphtheria, of which 3 were registered in Glasgow, were equal to the average in the earlier weeks of the quarter. The fatal cases of scarlet fever occurred in Glasgow, Motherwell, and Clydebank.

The deaths referred to diseases of the respiratory system, which had been 62, 40, and 53 in the three preceding weeks, rose to 61 last week, and were 5 above the number registered in the corresponding week of last year. The deaths from violence numbered 27, against 32 and 33 in the two preceding weeks.

HEALTH OF IRISH TOWNS

In the registration area of Dublin 181 births and 126 deaths were registered during the week ended Saturday, August 12th. The annual rate of mortality, which had declined from 13.8 to 14.1 per 1000 in the four preceding weeks, rose to 16.5 in the week under notice, against 10.6 and 11.9 per 1000 in London and Glasgow respectively.

Of the 126 deaths at all ages, 20 related to infants under 1 year and 34 to persons aged 65 years and upwards. Eleven deaths of infants (under 2 years) were referred to diarrhoeal diseases, and 1 fatal case each of enteric fever, scarlet fever and whooping-cough was registered. Six deaths were the subject of coroners' inquests and 67 or 45 per cent, of the total deaths occurred in public institutions.

During the same period 166 births and 87 deaths were registered in the city of Belfast. The deaths corresponded to an annual rate of 11.6, or 1.1 per 1000 less than in the previous week, and included 11 of infants under 1 year, and 19 of persons aged 65 years and upwards. Three deaths were referred to infantile diarrhoea and 1 each to measles and scarlet fever. The cause of 1 death was unclassified and 5 others were the subject of coroners' inquests while 26 deaths occurred in public institutions.

THE APPROVED SOCIETIES IN IRELAND AND THE CERTIFICATION SCHEME.—There seems to be some restiveness among the Approved Societies in Ireland with regard to the scheme for certification of insured persons recently arranged between the Insurance Commissioners and the medical profession. At a meeting of the Association of Approved Societies held recently in Dublin resolutions were passed demanding the immediate appointment of referees and asking for a grant to the Approved Societies as pay for additional sick visitors. Again at the Trade Union Congress held last week in Sligo a demand was made for the abolition of the present system of certification. As this system has only been in force for a few months it is much too soon to be able to judge finally of its qualities and whatever faults it may have, it is certainly an improvement on the haphazard system previously in existence. The societies feel no doubt that they have lost the patronage direct or indirect, which they previously possessed in regard to the appointment of certifiers, and they wish again to place the certifiers into their control. As a matter of fact the sickness benefits paid in the early part of this year under the new system caused a considerable easing to the societies.

THE SERVICES

ROYAL NAVAL MEDICAL SERVICE

Richard C P Whitcombe to be temporary Surgeon

ROYAL ARMY MEDICAL CORPS

Temporary Captain E W Skinner to be temporary Major
Temporary Captain L C Somervell relinquishes his commission on account of ill health

Temporary Captain J C McKerrow relinquishes his commission

Temporary Lieutenant W G Southey to be temporary Captain

The undermentioned to be temporary Captains A H H Sinclair, G D Mathewson, and J S Fowler

V Gamble to be temporary Honorary Captain whilst employed with the Withington War Hospital

The undermentioned to be temporary Lieutenants Lieutenant R H Astbury, from Royal Warwickshire Regiment, T F S Hanbury, J W Cowie, J W Otto van Millingen, F H Storey, A Wilkin, G J R Carruthers, G J M Fraser, K D Melville, F P Wigfield, T Peebles, E Burstall, T W E Ross, J V Rees, R McL Wishart, W J Crow, A B Allan, T N Darling, J G Jack, F Stevenson, H M Leathes, T McL Galloway, W H Booth, W S McLaren, E R Eatock, J McN Murray, W H Peacock, J F Gill, Temporary Honorary Lieutenant J C N Harris, R W Ironside, P R Lowe, H Blakemore, J McMurray, E C White, N E Kendall, H C Wilson, R H Rattray, R Lee, E R Bastard, E G Haig, C S O'Neill, H C Harper, J W B Hanington, J R Mcallef, A B Howitt, H M Churchill, and J C Ellis

Temporary Lieutenants F C Drew, J M Verster, and C D Pila relinquish their commissions

The undermentioned, having ceased to be employed with the Australian Voluntary Hospital, relinquish their temporary honorary commissions: Major E T Thrang, Captain W R Revnell, Captain G A. Paul, and Captain L S Kidd

Temporary Lieutenants to be temporary Captains whilst serving with the forces in West Africa: J Lindsav, A J M Crichton, B J Courtney, and R F Williams

Canadian Army Medical Corps: Lieutenant-Colonel A. Mignault to be temporary Colonel. To be temporary Captains: H S Smith and Lieutenant W A Smith. To be temporary Lieutenant: Lieutenant R H Stoddard

INDIAN MEDICAL SERVICE

The King has approved the promotion of the following officers—Lieutenant Colonel to be Colonel: P Carr White. Lieutenants to be Captains: R R M Porter, R Sweet, E Calvert, J R D Webb, F Phelan, A C Macrae, Nawin Chand Kapur, A H C Hall, J F Holmes, Narayan Krishna Rai, Haji Sulaiman Gulam hossein Haji. Temporary Lieutenants to be temporary Captains: P S Blaker and Shripat Govind Ranadav

SPECIAL RESERVE OF OFFICERS

Royal Army Medical Corps

The undermentioned to be Lieutenants: D Loughlin, W J Vance, G E Kidman, from University of London Officers Training Corps, Cadet S J Henderson from Glasgow University Training Corps, and R B Hick

TERRITORIAL FORCE

Royal Army Medical Corps

London Casualty Clearing Station: Lieutenant F A Dick to be Captain

Southern General Hospital: Lieutenant Colonel R S Smith resigns his commission

Highland Mounted Brigade Field Ambulance: Lieutenant (temporary Captain) L M A Mitchell to be Captain

Western General Hospital: Captain W A Hooton from Territorial Force Reserve to be Captain

Northern General Hospital: Captain T C Clare is seconded for duty with a General Hospital

Scottish General Hospital: Major B Riddell to be temporary Lieutenant Colonel whilst acting as Administrator of a General Hospital

London Sanitary Company: Lieutenants K B Williamson and J Tate to be Captains

Lowland Casualty Clearing Station: To be Lieutenants: D Campbell and F McV Dunlop

As related to this rather than Medical Units—Surgeon Major C I Barber from the York and Lancaster Regiment to be Major. Surgeon Captain J M Benson from West Riding

Paradeal Engineers: Captain T J Coello from Wessex Field Ambulance, and Lieutenants H G Ludolf and J Lillwall to be Captains

Correspondence.

NOTES ON THREE CASES OF CHLORINE GAS POISONING

To the Editor of THE LANCET

SIR,—At a time when massive poisoning by chlorine and other gases is in vogue the following notes on poisoning by small but repeated doses may be of general interest. In this instance the sanatorium is making some fairly extensive use of the nascent iodine treatment, so called, as it is supposed that by superimposing chlorine, in the form of freshly prepared chlorine water administered by the mouth, on potassium iodide given some two to five hours previously, nascent iodine is produced in the region of tuberculous tissue. The preparation of the chlorine is an objectionable matter, and we have devised various methods of so doing but in the best of these the escape of some free chlorine and its consequent inhalation is unavoidable. I quote three cases.

CASE 1.—The sister in charge prepared the gas regularly at the commencement of the year. It was done in a badly ventilated room, in which she spent some large proportion of her time. She complained of severe rheumatic pains, which did not yield to salicylates. Later she developed a severe bronchitis, which confined her to her room for some three weeks. On recovery all the symptoms disappeared. She was allowed to make no more of the drug. She has since been quite well.

CASE 2.—A medical student, a patient who was taking the preparation personally, volunteered to act as its dispenser. It was now made in an excellent well ventilated room, but he soon gave up the manufacture as it made him "cough so much at night."

CASE 3.—I now took on the whole of the manufacture. I may say that I have a slightly active tuberculous lesion. I used the well ventilated room and improved the technique, so that little or no gas escaped except when the apparatus was cleaned. I found the same effects as Case 2—a very irritable cough originating in the upper air passages, which gets worse at night, especially on lying down. There is a good deal of frothy mucus excreted but it is difficult to evacuate. Also a tightness across the front and upper part of the chest and shortness of breath (inspiratory). Later the rheumatoid pains occurred, and they are really severe, they make their appearance in the lumbar region and the big joints. The condition improved with a few days in bed, and shortly afterwards I took a fortnight's holiday, when after a few days they completely disappeared, and I had the first good night's sleep I had had for some weeks. On return I at once began to make the gas again, and within a few days I have noticed the cough and pains begin to return.

One evening a bottle containing some weak gas was laid on the ground near a slug. It was most interesting to watch the extraordinary output of mucus by the creature, which in a few minutes was quite enveloped in its own secretions.

I would warn others of the insidious nature of the poison and advise that a proper gas mask be worn if the stuff must be employed as well as taking every precaution in the way of ventilation and the use of a proper fume cupboard.

I am, Sir, yours faithfully

EDWARD BIGG, B C Cantab, M R C S, &c
Nordrach upon Menllop Bristol August 12th 1916

ATMOSPHERIC HEAT AND HUMIDITY IN RELATION TO PYREXIA

To the Editor of THE LANCET

SIR.—The leading article on Heat-Stroke in THE LANCET of July 29th draws attention once again to the effect of a hot damp, and stagnant atmosphere in raising body temperature and appropriately recalls Professor Haldane's statement founded on experiment that when the wet bulb temperature of the air exceeds 31.6° C (89.0° F) if the air is still the body temperature begins to rise and that even when the air is moving the body temperature begins to rise when the temperature of air approaches that of the body. This seems to be now generally recognised but that which is not so generally recognised is that the body temperature

begins to rise when the wet bulb temperature of the air is very much lower than 31° C (89° F), even when the air is moving slightly, if there is at the same time a certain degree of atmospheric humidity.

Below I give a series of 60 different combinations of atmospheric heat, humidity, and stagnancy under which body temperature begins to rise, and the degree to which the body temperature was so raised in some in four minutes and in all in less than four hours.

Atmospheric Conditions which Raised Body Temperature in the Cotton Sheds of Lancashire and the Linen Sheds of Ireland

Degree to which Body Temperature was Raised, and Pulse and Respiration Quickened by Exposure in the Cotton and Linen Sheds

No	Temp of air (°F)		Drying power of air per 10 c.ft	Length of exposure	Body temp in mouth (°F)	Pulse	Respirations

The rate of movement of the air could not be calculated as no movement was perceptible.

The above records of atmospheric conditions which raise the body temperature of some of those immersed therein from normal to the degree noted are, with the exception of those marked (*), taken from the appendices to the Reports of the Departmental Committee on Humidity and Ventilation in the Cotton Weaving Sheds of Lancashire and in the Linen Weaving Sheds in Ireland. I have however, given the drying

power of the air, calculated from the dry and wet bulb temperatures in the sheds, instead of the relative humidity as more clearly showing the degree of impediment to loss of heat from the body by evaporation, presented by the atmosphere in the sheds. The records marked (*) are from observations made by me, No 54 in the orchestral stalls of a theatre at a matinee performance and the others in glass houses artificially heated and humidified for the cultivation of orchids, crotons, grapes, tomatoes, &c. These I have added to carry the series to as low a degree of atmospheric temperature as possible.

It can be seen from this series of observations that the body temperature of some will begin to rise when the wet bulb temperature of the air is as low as 18.3° C (65.0° F), if no movement of the air is perceptible and the dry bulb temperature of the air is not above 19.4° C (69.0° F). If my own observations are correct the body temperature begins to rise when the wet bulb temperature of the air is only 17.2° C (63.0° F), if no movement of the air is perceptible and at the same time the dry bulb temperature of the air is not above 18.8° C (66.0° F). In addition to rise of body temperature and acceleration of the pulse and respiration, exposure to the warm or hot, damp, and stagnant atmosphere in the weaving sheds, also caused malaise, muscular pains, drowsiness, dizziness, headache, chilliness and shivering. Repeated exposure to such atmospheric conditions gives rise to anæmia and more serious effects.

The value of the foregoing table of combinations of atmospheric heat, humidity, and stagnancy, which raise body temperature, is that it supplies a standard by comparison with which we may see whether the natural meteorological conditions at any particular place are such as will cause pyrexia or not. It may thus help, perhaps to throw some light on the causation of certain pyrexias of short duration and of (at present) uncertain origin such as "trench" fever. By such comparison I have elsewhere given my reasons for believing that in the season when malarial fevers are prevalent, at Calcutta, Madras, and Bombay in India, at Puttalam and Kurunegala in Ceylon, at Singapore in the Straits Settlements, and at Ancon Colon and Oulebra in the Panama Canal Zone, the atmospheric conditions are such as will cause paroxysms of intermittent pyrexia, each paroxysm from 4 to 14 hours or even longer in duration. Indeed, the term Mal'aria would be a most suitable one to describe briefly atmospheric conditions which produce pyrexia in the cotton sheds or elsewhere. And doubtless, this was how the term came to be applied to the disease malaria as well as to the atmospheric conditions which were originally believed to cause this disease.

I am, Sir, yours faithfully,

MATHEW D O'CONNELL, M.D.,

TREATMENT OF THE MAIN NERVES IN AMPUTATIONS

To the Editor of THE LANCET

SIR—I wish briefly to draw attention to a subject which I think has not received the care its importance demands. It does not much prolong the time taken in an amputation, if the main nerves are drawn down out of their fascial envelopes and an inch or more of the nerve trunks cut away with scissors. The leaving of the main nerves in a stump to be entangled and subsequently pressed upon by cicatricial tissue, is responsible for painful "neuralgic" stumps. These are at once a source of intolerable suffering to the patients and of despair to those who have to fit them with artificial limbs. Furthermore the primary dressings, if there are no main nerves left free in the stump are rendered far less painful. This is a matter of no small moment in the many amputations now done through septic tissues where the flaps heal badly where subsequent scar tissue is very abundant and contractile, and where "packing" of the stump with eschara or other applications has often to be resorted to. In all the amputations of the upper extremity and also of the leg this drawing out and "cutting short" of the main nerves is of importance. In the thigh the sciatic nerve is rarely treated as a rule, but if long and prominent it should be similarly treated. I do not know if this procedure is advocated in

modern text-books I have employed it for years with advantages hardly to be exaggerated. I venture now to present it to the consideration of those employed in the surgery of the present war

I am Sir, yours faithfully,

A. MARMADUKE SHEILD,

August 1st 1916 Consulting Surgeon to St. George's Hospital

THE PSYCHO-PATHOLOGY OF WAR NEUROSES

To the Editor of THE LANCET

SIR,—Captain M. D. Eder's article on this subject was very interesting to read. But are his conclusions sound? All science is based on accurate observation. Where I can test Captain Eder's statements it seems very probable that he has made an inaccurate observation. In Case 7 there is a young man whose bent is towards ships and ship-building. He has obviously been often on the bridge of a ship. Yet Captain Eder reports him as saying "I rang down full speed ahead." Now that is what Captain Eder probably thinks is said by sailors but it is not "full steam ahead" is what is seen on every ship's telegraph. So it seems very likely to me that Captain Eder has allowed his preconceptions to distort the accuracy of his observations. And if it is so in this case it is probably so in others.

I am, Sir, yours faithfully,

G. BURTON BROWN M.D.

CHINESE TOE-ROT AND FOOT-TETTER

To the Editor of THE LANCET

SIR,—In your issue of June 10th (p. 1200) occurs a short note on "Chinese Toe Rot." A condition similar to that described is fairly common in Nigeria and presumably in most tropical countries, but we do not consider that it need be as intractable as indicated in your note. Treatment with various antiseptics and dusting powders as a rule alleviates but does not cure.

The method we advise based, clinically only on the fact that the organisms appear to flourish in an acid medium is usually much more rapidly effective, and consists merely in the repeated application of an antiseptic ointment rendered alkaline in some convenient way, e.g. by adding 5 gr. of sod. bicarb. to an ounce of ung. hyd. nit. dil. We have seen a case that had withstood three years' treatment with sulphur or iodine and various antiseptic dusting powders yield to the treatment indicated within three or four weeks.

We are, Sir, yours faithfully

ALIMENTARY REST IN DIABETES

To the Editor of THE LANCET

SIR,—Dr. O. Lorton's letter in THE LANCET of July 8th I really think is somewhat captious. The article criticised stated that Guelpa's theory was not generally accepted and described Allen's method as a decided advance, which is hardly doing Allen very scant justice. I was present at the debate. It was generally agreed that mild cases in later life usually respond rapidly to some such method of fasting. In the more severe cases the same may be freed from sugar temporarily but sometimes the general well-being of the patient suffers though even in these severe cases modified fasting will probably be very useful. So far I am in accord with your editorial view. But if Dr. Lorton will turn to the official record of that debate he will find that of the four speakers who followed him three made statements to that effect. Dr. Sprague said "I am inclined to think that in treating a chronic disease it is of importance to maintain the patient in such a state of nutrition that he can work and can care for himself." Dr. Ruffel said of his cases "the three more severe in whom our deliberate difficulty was experienced in preventing the recurrence of sugar when food was given so much so that I appeared a better plan to restrict the alimentary by periodical fasting on and off to

aim at complete elimination of glycosuria." Dr. Cammidge said "The dangerous increase in the acidosis, &c., observed by Stillman in some 10 per cent of his cases while undergoing Allen's treatment points to there being limitations to the usefulness of the method"—I am, Sir, yours faithfully,

August 11th 1916

M.D.

THE EFFECTS OF TRI-NITRO-TOLUENE ON WOMEN WORKERS

To the Editor of THE LANCET

SIR,—The observations by Dr. Agnes Livingstone-Learmonth and Dr. Barbara M. Cunningham in your issue of August 12th are interesting as a contribution to the study of T.N.T. poisoning and prompt these questions: 1. What methods were adopted for selecting the workers? 2. How many applicants were rejected? 3. What are the homes like? 4. How many are unable to take milk eggs, or cheese, the great lime-bearing foods? 5. Are many of them fond of vinegar, lemons, and acid fruits? 6. What is the state of the teeth?

The writers emphasise the value of cleanliness with what seems but little regard for circumstances. How can working women afford to change constantly their underclothing? Among a class where, when teeth are bad the cavities are stopped with bread, it is not surprising that underclothes should not be changed. It is here that social workers find an *impasse*, which can be surmounted only when priests and parsons realise that their responsibility begins in this life, or to put it more plainly until they take a more active share in the social work of their people, an example that is set them by the Rabbi of the Hebrew community.

I am, Sir, yours faithfully

Swansea, August 1st 1916

G. ARBOUR STEPHENS

Obituary.

MORTON ALFRED SMALE M.R.C.S. Eng. L.S.A.,
L.D.S.,

CONSULTING SURGEON DENTIST ST. MARY'S HOSPITAL, ETC.

THE death of Mr. Morton Smale in the midst of his activities at the age of 69 is a serious loss to the dental branch of the profession of surgery. During the 40 years that have elapsed since he first qualified there is hardly any post of responsibility in the world of dentistry which he has not occupied. We say hardly any because he never was President of the Odontological Society, neither was he President of the British Dental Association, but it is understood that he refused both these honours.

Morton Smale received his medical education at St. Mary's Hospital where he afterwards became dental surgeon having previously served in that capacity at the West London Hospital. He was medical tutor at the Dental Hospital of London and in 1883 succeeded Mr. Francis Ken Underwood as dean of that institution a post which he occupied with conspicuous success for 20 years. During that period he effected great changes in the hospital. He was the guiding spirit in the removal of the hospital from its original site to the present building, and bore no small part in the task of raising the necessary funds. In this difficult enterprise he was greatly assisted by his brother Mr. William Smale and very loyally supported both in sharing the work and subscribing the money by the then staff. During his deanship the Dental Hospital of London received the title of Royal. Another great work coming many months to arrange and many years constant daily supervision was the formation in the face of much opposition of the appliance department of the hospital. This scheme was planned in 1889 by Mr. Morton Smale, Mr. David Hepburn and Mr. A. S. Underwood. It was the first attempt to deal with the problem of supplying artificial teeth to suitable poor cases, a small fixed sum being demanded towards current expenses. This initiative was subsequently followed by most dental hospitals in the kingdom.

Mr. Smale's connexion with the Royal College of Surgeons of England was long and intimate. In 1886 he induced the Council of the College to allow a part or the whole of the three years' course of instruction in mechanical dentistry to be taken before registration. In 1889 he was appointed to

the Board of Examiners in Dental Surgery of the College, and remained on the Board until 1901, having been re-elected for a third period of two years to assist in the rearranging of the examination. In 1896 he was appointed one of the original members of the committee to decide the award of the John Tomes Prize for Scientific Research in Dental Science. In 1899 he visited the United States of America in company with Mr E Lloyd Williams, with the object of carefully investigating the methods of dental education and examination in that country, and in 1900 he presented an exhaustive report upon the subject to the Council of the College which was very useful to that body.

In 1913, when the International Medical Congress met in London, Mr Smale was President of the Stomatological Section, and the success which attended that portion of the great gathering was largely due to his efforts, ably seconded by the honorary secretary, Mr J F Colyer. The scientific work credited to the Congress has left a lasting mark on dental science. Soon after the outbreak of the war Mr Smale was asked by the late Mr Edmund Owen and Sir Frederick Treves to organize the dental department of the new hospital for wounded then being fitted out by the St John Ambulance and the Red Cross Society. This he did, and remained one of the honorary dental surgeons until his death.

Morton Smale was always convinced of the importance of regarding dental surgery as a branch of general surgery, and lost no opportunity of advocating that view. His death will be widely felt in the profession generally, many of whom are his old pupils and colleagues.

ALBERT FRÄNKEL

Albert Fränkel, the discoverer of the pneumococcus and its causal relation to pneumonia, died in Berlin on July 6th at the age of 68 years. A sympathetic account of his life appears in the *Deutsche Medizinische Wochenschrift* of July 25th from the pen of his colleague, F Kraus. Fränkel was one of the earliest pupils of von Leyden and followed worthily in the footsteps of his distinguished uncle, L Traube. For many years he was director of the medical section of the Am Urban Hospital in Berlin, but although for long one of the most prominent clinicians in Berlin and with a large and widespread consulting practice, he never obtained a teaching appointment at the University, an omission which was always a keen source of regret to him. Apart from his fame in association with the pneumococcus, Fränkel will be remembered for his contributions to medical literature on the subject of respiratory diseases. He was one of the founders of the Association of Physicians (*Verein für innere Medizin*), of which he was for long the tireless President. His death removes one of the few remaining names in German medicine which are well known in this country.

JOHN EUSTACE WEBB, M.B., C.M. ABERD., SURGEON ROYAL NAVY (RETIRED)

Dr J E Webb, who died suddenly at his residence in Looe, Cornwall, on August 6th, was a son of Dr F C Webb the editor of the *Medical Times and Gazette*. He graduated M.B., C.M. of Aberdeen University in 1884, and shortly afterwards entered the Royal Navy as assistant surgeon. He was at one time on the medical staff of the Royal Naval Hospital, Haslar. On his retirement he practised at Looe, where he held several appointments, including that of Admiralty surgeon and agent and port medical officer of health. Dr Webb will be greatly missed in Looe, where he was held in the highest esteem, and much sympathy is felt there for his widow and two children.

A CONVICTION UNDER THE DENTISTS ACT—At the Marylebone police court on July 28th, Henry John Goldberg was charged with unlawfully taking and using the description of dentist Mr R W Turner, who appeared for the British Dental Association, stated that two summonses had been issued against the defendant, one for implying that he was "registered under the Act," and the other for implying that he was "specially qualified" in advertisements which had appeared in various weekly periodicals. He called attention to a previous conviction on June 22nd 1915 (see THE LANCET, July 3rd, 1915 p 35) for using the words "Dental Practitioner," when the defendant was fined £20 and 5 guineas costs. Mr Snell said that the defendant pleaded guilty to the charge. The magistrate imposed the maximum penalty of £20 and 10 guineas costs.

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

- Captain H R Knowles, R.A.M.C. attached to the Royal Lancashire Regiment, was educated at Leeds University graduating M.B., Ch.B. in 1914. He joined the R.A.M.C. shortly afterwards, and was awarded the Military Cross in April last.
- Captain A. P. Low, R.A.M.C., attached to the Seaforth Highlanders, was educated at Edinburgh University and qualified in 1896. After holding appointments at the Dundee Royal Infirmary and at Craiglockhart Poor house he took up practice in Dundee, and joined the R.A.M.C. in 1912.
- Captain D H D Wooderson, R.A.M.C., attached to the Liverpool Regiment, was a student at St Bartholomew's Hospital, London, and joined the P.A.M.C. shortly after qualifying in 1914.

Wounded

- Lieutenant B Graves, R.A.M.C., attached to the North Staffordshire Regiment.
- Captain C H Wood, New Zealand Medical Corps.
- Lieutenant R Felton, R.A.M.C., attached to the Middlesex Regiment.
- Captain G J Fraser, R.A.M.C. attached to the Northumberland Fusiliers.
- Lieutenant F L Keith, R.A.M.C., attached to the Northumberland Fusiliers.

Missing

- Surgeon Probationer G S Freeman, H.M.S. Lassoo, R.N.V.R.

Prisoner at Kut el Amara

- Major E A Walker, Indian Medical Service.

Previously reported Believed taken Prisoners at Kut el Amara now reported Prisoners

- Major E F E Baines Indian Medical Service.
- Captain S G S Haughton, Indian Medical Service.
- Lieutenant R V Martin, Indian Medical Service.
- Captain A T J McCreery, R.A.M.C.

Believed taken Prisoners at Kut-el Amara

- Captain P B Bharucha, Indian Medical Service.
- Lieutenant N S Jatar, Indian Medical Service.

DEATHS AMONG THE SONS OF MEDICAL MEN

The following sons of medical men must be added to our lists of those who have fallen during the war —

- Lieutenant R W Vaughan Roberts Liverpool Regiment elder son of Dr W Vaughan Roberts, J.P., of Blaenau Ffestiniog, North Wales.
- Second Lieutenant P M Alexander, Gordon Highlanders eldest son of Dr S P Alexander, of Southsea.
- Lieutenant Q M V Bidle, Royal Living Corps and Royal Scots only son of Lieutenant Colonel G Bidle, I.M.S.
- Captain J G Hurd Wood Infantry Brigade, son of the late Dr J Hurd Wood, of Whitmead Hill, Farnham.
- Captain H R Knowles, R.A.M.C., attached to the Lancaster Regiment, eldest son of Dr H Knowles of Hertham late of Barnsley.
- Captain P Wood, 89th Punjab, youngest son of the late Brigade Surgeon J Wood, of Lichfield.
- Captain G Blackader, Canadian Infantry, son of Dr A D Blackader, of Montreal.
- Private C C Keelan H.A.C. youngest son of the late Dr A W Keelan, of Dominica West Indies.
- Second Lieutenant W C Bower King's Own Royal Lancashire Regiment elder son of Dr W Bower of O'fert St Mary and late of Hendon.
- Private W L Roberts, Royal Warwickshire Regiment the son of Dr R L Roberts, of Rusdon North Wales.
- Lieutenant C T C Irvine 25th Punjab son of the late Surgeon General J Irvine R.N.
- Private J G Burnie Royal Fusiliers elder son of Dr W G Burnie, of Bradford.
- Private E J D Fooks Otago Regiment, younger son of Lieutenant Colonel G E Fooks I.M.S.
- Private C G Weldon South African Infantry only son of the late Dr G Weldon of London.
- Captain F L Newstead Durham Light Infantry eldest son of Dr G Newstead of Blith Northumberland.

OBITUARY OF THE WAR

ALFRED MAURICE THOMSON M B B S R U I
CAPTAIN ROYAL ARMY MEDICAL CORPS

Captain A. M. Thomson who was killed in action in France on July 7th at the age of 31 was the only son of Alfred Thomson, of Marlborough Park Belfast. Educated at the Royal Academical Institution and at Queen's College, Belfast he graduated M B in 1909 subsequently obtaining the D P H of Cambridge. Volunteering for service soon after the outbreak of war he had been at the front since June 1st 1915. He was wounded when rescuing his adjutant under heavy fire, and as he continued to attend to the injured was subsequently killed outright by the explosion of his ammunition pouch.

His commanding officer speaks of the loss of Captain Thomson as of a personal friend, and other letters from fellow officers and colleagues confirm the impression of a man quite fearless in the carrying out of his duties. He was in practice in Belfast prior to obtaining his commission and his early death is keenly felt there.

JOHN HENRY DYKE ACLAND M R C S ENG.,
CAPTAIN ROYAL ARMY MEDICAL CORPS

Captain J. H. Dyke Acland who was killed on active service in France on the night of July 12th was born in 1880 and was the second son of the late Rev. Henry Dyke Acland, rector of Luccombe Somerset. He was educated at Blundell's School and afterwards at St. Thomas's Hospital where he qualified as M R C S and L R C P in 1905. He became house surgeon to the East London Hospital for Children, Shadwell, and house physician at the West London Hospital. After completing these resident appointments he went to South Africa as medical officer to the Beira railways and practised for some years in Bulawayo, the chief town of Southern Rhodesia. At the outbreak of war he returned to England and applied for a commission in the Royal Army Medical Corps, being gazetted lieutenant on Oct. 17th 1914. In November of the same year he married Elizabeth Margaret, daughter of Charles Corner of The Lodge, High Ham near Langport, Somerset. He was an enthusiast in his work and of a genial and cheerful disposition, which brought him many friends and made him welcome wherever he went. He met with his death in a way in which he himself would have desired—while endeavouring to relieve a wounded man.

The officer commanding his battalion writes of Captain Dyke: "He went out in the front of our line to try and find a wounded man who was reported to be here. By the grace of God he was hit by a bullet and died almost at once. He is a very great loss to us, besides being a skilful doctor, he was a most cheerful companion and we all miss him dreadfully. He did most gallant work in the

attack on July 1st. I immediately recommended him for the Military Cross, and if he had been spared there is not the least doubt that he would have been awarded it. He died whilst trying to perform an act of mercy."

HUGH GWILYM MORRIS B A M B, B Ch ONON,
CAPTAIN ROYAL ARMY MEDICAL CORPS

Captain H. G. Morris, who was killed in action in France on July 14th, at the age of 32 was the only son of William Morris, estate agent, of Glanllyn, Bala. He was educated at Llandovery College and went on from there in 1901 to Oxford where he graduated B A in 1903 and M B in 1914 after having spent part of his medical course at the London Hospital. Whilst an undergraduate at Oxford Captain Morris was keen on football, he played in the University team and was a reserve blue. He also played for several London clubs and was a member of the London Hospital football team. In January, 1915 he took a commission in the Royal Army Medical Corps and was promoted Captain a year later. He was killed outright whilst in the act of saving a wounded soldier under circumstances for which he was recommended by his commanding officer for the Victoria Cross.

In a letter to Captain Morris's parents a colleague alludes to his popularity in the service and the fact that many of his fellow officers would miss him keenly. The commanding officer wrote that he died as he had lived—a pattern of unselfishness—considering himself last. Captain Morris was married in 1911, and leaves a widow and two children.

RICHARD FENTON THEODORE NEWBERRY, M B
CH B EDIN.,
LIEUTENANT ROYAL ARMY MEDICAL CORPS

Lieutenant R. F. T. Newberry, who was killed in action in France on July 14th at the age of 25 was elder son of the late E. C. Newberry, and was born at San Remo, spending his early years there and at Nice. He was educated at Tonbridge School and after passing the London matriculation examination he entered as a student of medicine at Edinburgh University, graduating there in March 1915. As an undergraduate he was an active member of many of the students' gatherings, being senior president of the Philomatic Society in the year 1914-15. Besides this he took a keen interest in social work and belonged to the University Settlement. After a short period as junior house surgeon at the Edinburgh Royal Infirmary he joined the Royal Army Medical Corps in November 1915 and was attached to the Northamptonshire Regiment. Recommended for the Military Cross on July 1st he was killed instantaneously a fortnight later by a shell as he was attending the wounded.

One of his old Edinburgh teachers writes of Lieutenant Newberry: "He went out in the front of our line to try and find a wounded man who was reported to be here. By the grace of God he was hit by a bullet and died almost at once. He is a very great loss to us, besides being a skilful doctor, he was a most cheerful companion and we all miss him dreadfully. He did most gallant work in the

One of his old Edinburgh teachers writes of Lieutenant

Newbery as a man on whom he could always depend for carrying out intelligently and well whatever practical work was entrusted to him. It is evident from their letters that his men had a similar confidence in him. "He always looked after us so well, and would never lead us to a place he would not go himself." His coolness and efficiency in danger were products of his self forgetfulness and a desire to do his duty without external show.

THE CENTRAL MEDICAL WAR COMMITTEE

The Committee met on Wednesday last, the time being mainly occupied in considering, sitting as the Central Professional Committee applications for exemption from military service referred to the Committee by local tribunals.

The difficulties that might arise in connexion with disabled soldiers came under discussion, for it was recognised that it might be necessary in the interests of these men to retain at certain hospitals medical practitioners who are within the age limit for accepting commissions.

THE PENSIONS SCALE FOR AMPUTATIONS IN THE NAVY

Dr Macnamara stated in Parliament on Wednesday that the Admiralty has adopted the scale of pensions for amputations which was settled by the Chelsea Commissioners for the Army. Up to the adoption of the new scale the Admiralty allowance was 10s 6d a week in respect of the loss of a limb. The Army scale is as follows—Loss of leg. Off up to the hip, 16s (weekly), short thigh, 14s, above the knee, 12s 6d, below the knee, 10s 6d. Loss of arm. Right arm to the shoulder, 16s, left arm to the shoulder, 15s, above or through elbow joint (right arm), 14s, (left arm), 13s, below the elbow (right arm), 11s 6d, (left arm), 10s 6d.

HOSPITAL UNITS FOR RUSSIA. SURGEONS WANTED

The Joint War Committee of the British Red Cross Society and the Order of St John of Jerusalem in England is shortly despatching two field hospital units for service in Southern Russia. We are asked to state that there are still vacancies for two experienced surgeons in these units, and the Committee would be glad to receive immediate offers from surgeons who are willing to proceed abroad and are able to do so under the present War Office Regulations. Application should be made, if possible in person, at 11 o'clock any morning, at 83, Pall Mall, Room No 93 or by appointment at other hours.

THE PAY OF A SPECIAL RESERVE R.A.M.C. OFFICER

We have received the following letter from a correspondent who considers that the inequalities of pay as shown by the sums received by Special Reserve and Temporary officers, ought to be abolished—"I have recently completed two full years of active service at home and abroad. As a Special Reserve R.A.M.C. officer I had already been trained for my duties and was also required to give my services immediately on mobilisation. I had received three retaining fees, each of £20—not an extravagant allowance considering that I had to leave my practice without even an opportunity to introduce my patients to a deputy. I wish to compare my receipts during the two years from army sources with that of an hypothetical temporary lieutenant, R.A.M.C., who should have performed exactly the same duties but who, of course, was not already trained left his practice at his own convenience, and had had no retaining fees. My total receipts, including allowances for travelling and every other sort of payment, were £877 0s 6½d, which works out at 24s a day. (About £600 of this was taxed before receipt so that I did not actually handle this sum.) The temporary officer would have received for the same duties £997 13s 11½d, i.e. 27s 3d a day. Deducting from both allowances for equipment on mobilisation for travelling, and for extra duty (e.g. as surgeon, in charge of hospital, &c.) the two sums would be £786 3s 0½d and £926 16s 5½d or 21s 6d and 25s 4d a day—roughly my extra experience and extra readiness has cost me £120. Not very long ago Mr Tennant stated in the House of Commons that there was not much difference in the pay of Special Reserve (and Territorial who are similarly penalised) officers. I find £60 a year quite an appreciable difference, and venture to think

that most medical men will share that view. As the question of what the officer belonging to each class actually gets is complicated by the allowances each may draw, and so leads itself admirably to mis-statement, I hope that you may find room for this short statement."

TWO YEARS' WORK BY THE WOUNDED ALLIES' RELIEF COMMITTEE.—The committee was one of the first war charities to be started after the outbreak of war, the nucleus having been formed on the evening of August 4th, 1914, the very day of the declaration of war by Great Britain. The first task of the committee was to help to bring wounded Belgian soldiers to England and to distribute them in hospitals. Since then the relief work has extended to many other spheres, and touches in one way or another all our Allies. With regard to activities for Belgium, the committee has maintained two homes for disabled Belgian soldiers in England, where they have been fitted with artificial limbs and taught various trades to render them self supporting, and it also keeps up a sanatorium at Eastleigh for Belgian soldiers suffering from phthisis, it has presented to the Belgian Army four bath caravans for use at the front, also a caravan soup-kitchen to supply the troops in the trenches with hot tea, coffee, or soup and, in addition, two bath caravans made on an improved plan and capable of furnishing 70 hot baths an hour.

In France the committee is maintaining two hospitals for French soldiers—the one at Limoges, containing 225 beds, the other at Lyons, with 300 beds.

To the Russian Red Cross Society the committee has given four motor ambulances, each containing four stretcher beds, and to the Italian Army it is supplying a motor operating theatre, the first of its kind ever constructed that will enable urgent operations to take place at the front and thus save the lives of many wounded men who might otherwise die on their way to hospital.

Concerning relief work for Serbia and Montenegro, the committee sent out a fever unit, consisting of doctors and nurses, to Serbia and up to the time when the Austrians took possession of the country, it was maintaining one large hospital in Kragujevatz and another in Podgoritz, and since the retreat of the Serbian Army has sent out fresh units with stores and provisions to Corfu, where a vast amount of work has been and is being done, attending to the disease-stricken remnants of the Serbian Army.

For the benefit of all our Allies the committee supplies from its hospital depot all sorts of bandages and other hospital requisites, and in the first half of 1916 supplied the hospitals of our Allies with over 175,000 articles. London hospitals for British wounded have also received gifts from the depot. And in addition to the activities referred to the committee has equipped and maintained various other hospitals and homes both at home and abroad, giving the relief that was needed when it was needed.

HAROLD FINK HOSPITAL, PARK-LANE—Mrs Catherine Fink has endowed beds at this hospital to the extent of £5000, and has requested Dr Douglas Shields to administer the endowment fund. The Duchess of Portland has consented to act as nominator of patients for the beds which are available for the free treatment of officers disabled by the war.

"BEHIND THE LINES"—We have received Nos 1 and 2 (the May and June-July issues) of a little magazine with this title designed principally to interest and amuse the sick and wounded in the No 10 Stationary Hospital at the front. No 1 contains a well reproduced photograph of the officers of the hospital and No 2 a reproduction of a photograph of the whole staff. The address is "Somewhere in France."

DONATIONS AND BEQUESTS—The Royal Westminster Ophthalmic Hospital has received a grant of £1,000 from the trustees of the Fanz Bequest.—Miss Barrell of Fairthorn Manor, Cardridge has sent a donation of £500 to the Royal Hants County Hospital, Winchester.

A CAB WHISTLING PROHIBITION—It is understood that regulations prohibiting whistling for taxicabs between the hours of 10 p.m. and 7 a.m. are to come in force next week in certain specified areas of London including those containing the military hospitals and perhaps in the whole London County Council area.

Medical News.

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGES OF PHYSICIANS OF LONDON AND SURGEONS OF ENGLAND—As the result of the Final Examination held from July 4th to 25th, the following candidates were among those approved in the undermentioned subjects, but have not yet completed the examination—

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS

Medical Arrangements in Mesopotamia

IN the House of Lords on Tuesday, August 15th, Lord ISLINGTON stated that the chief cause of the sufferings of the troops in Mesopotamia had been lack of transport, but an increase was being provided. He said that in the report of the Vincent Commission special recognition was made of the very valuable services that were rendered by officers and men of the Royal Army Medical Corps and of the Indian Medical Service.

HOUSE OF COMMONS

WEDNESDAY, AUGUST 9TH

Petrol for Private Hospitals

Mr BROOKES asked the Financial Secretary to the War Office whether his attention had been called to the difficulty of carrying on many of the private hospitals for wounded soldiers owing to the inability of those providing them to obtain the necessary supplies of petrol—Mr FORSTER replied: The attention of the War Office has been called to a few instances where inability to obtain necessary supplies of petrol have been alleged, and the hospitals concerned have been informed how to obtain their requirements. The proper course is for hospitals to bring their difficulties in this matter to the notice of the general officers commanding in-chief of the Commands. It would save time if hospitals would communicate direct with the Commands with whom the decision rests.

THURSDAY AUGUST 10TH

Prisoners of War

Lord ROBERT CECIL (Under Secretary for Foreign Affairs) informed Mr HUME WILLIAMS that Switzerland had fixed no maximum number of prisoners of war which she would accept. Time was required to examine the prisoners who were scattered about all over Germany, but it was understood that 764 British prisoners were to arrive in Switzerland on August 11th. The Government were proposing that the Swiss Medical Commissions should visit this country and Germany every quarter.

Unregistered Dentists and Cocaine

Answering Captain DOUGLAS HALL Mr H. SAMUEL (Home Secretary) said: In response to the representations which have been made to me from many quarters of the House I propose to extend the temporary permit which I have already granted for the purchase of cocaine preparations by unregistered dentists, and in the meantime to make further inquiries into the subject.

The Treatment of Nerve-shaken Soldiers

Mr BRYN asked the Parliamentary Secretary to the Local Government Board whether it was in contemplation to institute convalescent homes, affording cheering surroundings and suitable employment for uncertifiable nerve-shaken soldiers of the rank and file who after discharge from the Army, were no longer under military control and who being civilians could not legally be placed under military control without formal certification—Mr JAMES HOPKINS, in behalf of Mr HAYES FISHER, answered: The Statutory Committee are giving very careful consideration to the question of institutions or some alternative treatment for uncertifiable nerve-shaken soldiers. My right honourable friend is informed that under the arrangements made by the War Office such men are retained in military hospitals as long as they require specialist medical in-patient treatment.

Health of Mesopotamian Forces

Replying to Sir E. COWWALL Mr FORSTER (Financial Secretary to the War Office) said: I cannot tell you the general health of the troops in Mesopotamia has been good. Every effort is however being made to combat the sources of disease and the sanitary conditions in it.

Mediterranean has been sent to Mesopotamia to assist the local military authorities

Medical Arrangements at Salonica

Mr G FABER asked the Financial Secretary to the War Office whether there was an insufficiency of sun helmets for our troops at Salonica and an insufficiency of punkabs for the sick and wounded there.—Mr FORSTER No, sir. There is no insufficiency of sun helmets. A sufficient supply to cover issues to the whole force was sent from Egypt last month. No representations have been received as to the insufficiency of punkabs for the sick and wounded.

Mr SHIRLEY BEN asked whether, considering the discomfort felt throughout the Empire owing to the medical arrangements in the past in Mesopotamia, he could tell the House that the medical arrangements at Salonica was thoroughly satisfactory.—Mr FORSTER answered Perhaps I cannot do better than read to the House an extract from a letter written by the Red Cross Commissioner in Macedonia, Sir Courtauld Thomson, who has been familiar with the medical arrangements in France and other theatres since the beginning of the war. He writes as follows under date July 26th—

Any striking change here is the progress that has been made in the hospital accommodation and arrangements. I have been in all your general hospitals and many of the casualty clearing stations and field ambulances and the standard of efficiency seems very high. I have been impressed by the officers commanding. It is a pleasure to see the pride which they take in their own unit and their keenness to try and make it the best of its kind. The last three weeks have been a great strain on everyone but the medical service has risen splendidly to the occasion.

It is the case that there has been a good deal of malaria amongst the troops in the Struma Valley but this is now I am glad to say lessened.

MONDAY AUGUST 14TH

Medical Arrangements in Mesopotamia

Sir HENRY CRAIK asked the Secretary for India whether he had now communicated with the authorities in India and obtained their consent to the publication of the report of Sir W. Vincent General Bingley and Mr Ridsdale with regard to the medical arrangements and transport in Mesopotamia and whether the report would be laid upon the table before the recess.—Mr CHAMBERLAIN said in reply Copies of the report and of the Commandant in Chief's Memorandum upon it were despatched from India last month. The appendices including the evidence were sent early this month. I am informed by the Viceroy that a general review of the report and its appendices will follow as soon as they have been fully examined. Since the Vincent Commission reported Parliament has appointed a Statutory Commission to inquire into the origin, inception and conduct of the operations of war in Mesopotamia including *inter alia* 'the provision for the sick and wounded' and this Commission is specifically directed to proceed with all possible expedition to inquire with regard to the provision for the sick and wounded and to report the result of their inquiries on this matter as soon as they are completed. All the documents emanating from the Vincent Commission will be laid before the Statutory Commission as soon as they are received and will I think greatly facilitate their task. But meanwhile the matters treated by the Vincent Commission must be considered as still *sub judice* and their Report cannot be published. The House has the assurance of my right honourable friend the Secretary of State for War that everything possible is being done to remedy the defects disclosed which were largely though not entirely due to difficulties of transport. I should add that I have seen an advance copy of the Report. In addition to criticisms of Indian military organisation—a matter which is now engaging the serious attention of His Majesty's Government—it mentions certain officers by name as having a grave responsibility in connection with the state of affairs disclosed by the investigation. For various reasons the Commission was I believe unable to examine any of these officers in person. They will no doubt be so examined by the Statutory Commission in whom their case and the measure of their responsibility will be considered. Meanwhile I may say that the officers so named have vacated their positions and new appointments have been made to the posts formerly held by them.

Sir I. CURSON Is the right honourable gentleman aware that there are still unsatisfactory reports coming from Mesopotamia and can he assure the House that any suggestion made by the Vincent Commission will be at once carried out?—Mr CHAMBERLAIN in the course of his reply said I am aware that everything is not yet absolutely satisfactory. That was stated the other day by the Secretary for War. Although difficulties of transport have not yet been wholly overcome and cannot be overcome for some little time I believe that matters have much improved. The new Director of Medical Services in India went to Mesopotamia on his way to India and dealt with the defects he found and I believe everything possible is now being done to set things straight.

Sir H. CRAIK Are we to understand that the only effect of the appointment of a Statutory Commission up to now has been to delay the issue of the report of the Vincent Commission, which was appointed in February last?—Mr CHAMBERLAIN The appointment of the Statutory Commission will not be used as a reason for not taking immediate steps when such are shown to be necessary.

Mr R. McNEILL Will the report of the Vincent Commission be published?—Mr CHAMBERLAIN The military advisers of the Government have reported that it would be contrary to the public interest to publish the papers in regard to the operations because they would give information of military value to the enemy. I cannot therefore promise to present any further papers in regard to military affairs or operations until they have been seen and examined by the General Staff.

Medical Women and the War Office

Mr DICKINSON asked the Financial Secretary to the War Office whether women doctors were now being employed upon foreign service under the War Office, and if so, whether they were entitled to receive the same pay as male doctors so employed, whether they were given the same allowances for rations, foreign service, &c. as the men, and if not what was the reason for this differentiation.—Mr FORSTER replied Women doctors will receive the same pay and allowances as male doctors similarly employed.

TUESDAY, AUGUST 15TH

Medical Services for Munition Workers

Answering Mr MACMASTER, Dr ADDISON (Parliamentary Secretary to the Ministry of Munitions) said Every effort is being made to provide a suitable medical and nursing service in munition factories so far as may be necessary. Special arrangements are made with regard to workers in explosive and filling factories and for those engaged in other dangerous occupations. In connexion with these further steps are at present under consideration. It is obvious that the means for obtaining these services are affected by the demand for medical services on the part of the military and naval authorities and of the civilian population.

WEDNESDAY, AUGUST 16TH

Infectious Paralysis in New York

Commander BELLAIRS asked the President of the Local Government Board what immediate steps were to be taken in regard to the alarming outbreak of infectious paralysis in New York in order to prevent it spreading to this country.—Mr LONG replied We are fully acquainted with the facts of this case with the nature and history of the disease so far as it is known, and with the steps that are being taken to deal with it in New York. Cases of this disease have occurred here for a long period. The ordinary administrative machinery for the protection of this country is sufficient, and no special steps are, I consider, called for in respect of this disease.

Appointments.

Successful applicants for vacancies Secretaries of Public Institutions and others possessing information suitable for this column are invited to forward to THE LANCET Office directed to the Sub-Editor not later than 9 o'clock on the Thursday morning of each week such information for gratuitous publication.

ADAMS WILLIAM HENRY L.R.C.P.S. Edin. I.F.P.S. Glasg. has been appointed Acting Deputy Medical Officer for the Thirteenth District of the Kingsbridge (Devon) Union.
LLOYD GEORGE ALEXANDER M.A. Oxon. M.D. Brux. L.R.C.P. M.R.C.S. D.P.H. Deputy Acting Medical Officer of Health for Torquay.
PATTERSON NORMAN M.B. F.R.C.S. Assistant Surgeon to the Throat and Ear Department at the London Hospital.
SMITH OSWALD ROBERT H. M.B. B.C. Cantab. L.R.C.P. M.R.C.S. Acting Deputy Medical Officer for the Linkinhome District by the Llandudno (Cornwall) Board of Guardians.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).
When the application of a *British subject* would be considered the advertiser is requested to communicate with the Editor.
BIRMINGHAM UNION INFIRMARY—Female Resident Assistant Medical Officer. Salary at rate of £500 per annum with board and with board.
DR. VOL. FRYE HOSPITAL—House Surgeon. Salary £250 per annum with board.
CITY OF LONDON HOSPITAL FOR DEAF AND MUTE CHILDREN—Victorian. Salary at rate of £200 per annum with board.
DORCHESTER COUNTY COUNCIL—Two School Medical Officers. Salary £100 per annum.

CHILDREN'S COUNTRY HOLIDAYS FUND

To the Editor of THE LANCET

SIR,—This beautiful sunshine is delightful for children in the country, but these hot summer days are very different in the close courts and back streets for the children of the town. These children for whom the Children's Country Holidays Fund works are the children of our fighting men and of the men who are working to supply them with the means of fighting. This year subscriptions are more than £1000 less than last year. May I beg the help of your readers?

I am, Sir yours faithfully
 FRANCIS MORRIS
 Chairman of the Fund
 18, Buckingham street Strand, W.C., August 12th, 1916

THE SPELLING OF CINCHONA

To the Editor of THE LANCET

SIR,—The interesting letter signed 'W' in your issue of August 12th puts forward an explanation for the omission of the letter 'h' in the spelling 'cinchona,' which hardly meets the case, for in the *Larmacopea Ufficiale del Regno d'Italia* we find "*China China Cortex Chinichina—Quirquina*" This corresponds more with W.W. Skeat's derivation (Etymological Dictionary). "The form Kina easily produces quinine and kinken would give both quinquina and (modification) cinchona." C. Ruiz writing more from a pharmacological than a philological standpoint writes "Linnæus gave the name of cinchona to this tree (C. succubura) in honour of the Countess of Chinchón, who was reported to have introduced the bark into Europe in 1640." He however also says "Kina means in the language of the ancient Peruvians, bark, Kina kina, a good bark. From this the French have derived their present word Quinquina, the English their Quinine, and the Italians China." In Germany the Italian spelling has been adopted. "The theory of Sir Clements R. Maricham, which holds its ground. "Most unfortunately Linnæus was misinformed as to the name of her whom he desired to honour. The mislaid Linnæus spelt the word Cinchona (Gen Pl 1717) and Cinchona (Gen Pl ed 1767), omitting one or two letters but the fact that he altered the spelling in his different editions proves beyond any doubt that he desired to spell the word correctly." Unfortunately, Linnæus died before the error was pointed out and corrected which was done by the Spanish botanist Ruiz and Pavon in 1778 the very year of Linnæus's death. It has also been said that when the English spelling of the word was brought under the notice of the great Swedish botanist he considered that the 'h' was excrement and due to the palatalisation of the letter 'c.' The introduction of the use of the plan in Europe is incorrectly ascribed to the Lady Ana de Orosio who in 1615 married Don Luis de Velasco who on the death of his father became Marquis of Salinas Lord of Carrion and a Knight of Santiago. He died in 1619 and in 1621 the Marchioness of Salinas became the wife of Don Juan Geronimo Fernandez de Cabrera y Bobadilla, fourth Count of Chinchón, and on Jan 14th 1622, received the seals of office of Viceroy of Peru from his predecessor the Marquis of Guadalcázar. But ere the Count of Chinchón left Spain the beautiful Ana de Orosio died and the second wife of the Count, Francisca Henriquez de Ribera who accompanied him to Peru as Vice Queen fell ill of malarial fever was treated with Peruvian bark obtained from Don Francisco Lopez Canizares, who was then Corregidor of Loyca by her physician Dr. Don Juan de Vega. She made a quick complete recovery but the disease recurred in 1633 and died on her return journey to Spain with her husband. She had resigned his vice royalty to his successor the Marquis of Mancera. Thus we find it was the count who was a generous distributor of the famous powder. We must now retain the spelling cinchona for as Murray (New Latin Dictionary) writes "The acceptance of the name is too deeply imbedded in botanical and chemical nomenclature to make this change expedient." I am Sir yours faithfully

Dublin August 12th 1916 G. G. G. G.

BIRTHS

BOWEN—On August 12th at Towor House Warblersville-road Crouch End to Daisy wife of Lieutenant O G Bowen R.A.M.C. Chatham House Chislehurst, a son

COLYER—On August 14th at Parkhurst Claygate Surrey the wife of Captain Claude G Colyer R.A.M.C. of a daughter

FIDDIAN—On August 12th at Cambridge to Captain J V Fiddian R.A.M.C. and Mrs Fiddian—a daughter

GLAISTER—On August 4th at Weir Cottage Chertsey Surrey the wife of Captain J Norman Glaister R.A.M.C. of a son

HOLLAND—On August 16th at 55 Queen Anne-street W the wife of Barclay Holland M.D. of a daughter

YOUNG—On August 11th at St Brerel's Woodcote Park road Epsom the wife of Captain John Benson Young R.A.M.C. of a son

MARRIAGES

BONNEY—WILLIAMS—On August 9th at St Mary Abbots Kensington Ernest Henry Bonney M.R.C.S. &c to Gertrude Mary daughter of Mr and Mrs Edmund G Williams of Stanfort-road Kensington W

DAVEY—STAPLES BROWNE—On August 12th at St Mary's Church Bampton Oxfordshire Thomas Ronald Davey Lieutenant R.A.M.C. to Mary Frederica only daughter of the late Frederick John Staples Browne of Launceston and Bampton

PRATT—WINKLEY—On August 8th at the Parish Church Houghton on the Hill Leicestershire by the father of the bride Captain Oliver Beakley Pratt R.A.M.C. to Catharine Rose Thorold eldest daughter of the Rev S Thorold Winkley and Mrs Winkley

DEATHS

DELLY—Killed in action on April 23rd 1916 Julius Henry Delly M.B. Captain R.A.M.C.

BURNIE—Private John Giehrst Burnie Royal Fusiliers (University and Public School Corps) 21 years of age killed in action at the taking of Delville Wood. Oldest son of Hon. Scholar of St John's College Oxford. Elder and beloved son of Dr and Mrs Giehrst Burnie Heston Brahmston

CLEMENS—Killed in action North Sea, on May 31st on H.M.S. Defence Frederick William Theodor Clemens M.B. D.S. London Temporary Surgeon R.N.

TICHAULT—On August 10th at Maryden Charles Sage Tichault M.R.C.P. M.R.C.S. L.R.C.P. L.S. London late Surgeon Major (V.C.) 5th V.B. (Duke of Connaught's Own) Hussar Regiment aged 69 years

N.B.—A fee of 2s is charged for the insertion of 2 notices of Births, Marriages and Deaths

Communications not noticed in our present issue will receive attention in our next.

(Taken in a' 5:30 a.m. by Steward's Instructions)

THE LANCET OFFICE August 16th 1916

The following magazines, journals, etc., have been received -

LECTURES, ADDRESSES, DEMONSTRATIONS, &c
POST-GRADUATE COLLEGE West London Hospital Hammersmith
road W

NORTH EAST LONDON POST-GRADUATE COLLEGE Prince of
Wales General Hospital, Tottenham &

THE THROAT HOSPITAL, Golden square W
 MONDAY - 5.15 P.M. Special Demonstration of Selected Cases.
 THURSDAY - 5.15 P.M. Clinical Lecture

It is most important that communications relating to the Editorial business of THE LANCET should be addressed exclusively 'TO THE EDITOR' and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention should be given to this notice.

Lectures, original articles, and reports should be written on one side of the paper only and when accompanied by blocks it is requested that the name of the author and if possible of the article should be written on the blocks to facilitate identification.

Letters which are intended for insertion or for private information must be authenticated by the names and addresses of their writers, not necessarily for publication. We cannot prescribe or recommend practitioners. Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor." Letters relating to the publication sale and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS not used

THE INDEX AND TITLE-PAGE TO THE LANCET

January to June, 1936

I view of the Government restrictions upon the supply of paper and the shortage of paper quite apart from these restrictions the Index and the Title page to the volume of THE LANCET which was completed for the issue of June 24th have been printed separately and copies have been supplied gratis to those subscribers who have up to August 17th intimated to our printer how to receive them. Other subscribers will be similarly supplied so long as the stock remains unexhausted on application to the Manager of THE LANCET Office, 3 Strand London W.C. Such application should please be sent in a once direct to the Manager and not through

Volumes and Cases

VOLUMES for the first half of the year 1916 are now ready Bound in cloth, gilt lettered, price 16s., carriage extra.
Cases for binding the half year's numbers are also ready Cloth, gilt lettered, price 2s., by post 2s. 4d.
To be obtained on application to the Manager, accompanied by remittance

TO SUBSCRIBERS

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423 Strand London, W.C., are dealt with by them? Subscriptions paid to London or to local newsgagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and not to THE LANCET Offices

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch

Communications, Letters, &c., have been received from—

THE LANCET.

LONDON SATURDAY AUGUST 26 1916

Students' Guide Session 1916-1917

THE ranks of the medical students are necessarily sorely depleted, and most of the men who, in the ordinary course, would be entering upon a medical career are studying the laws and facts of life in the glorious and bitter school of war. An increase of women students is the notable feature of modern medical education, and for the enthusiasm with which they have been entering upon hard and noble work we, in common with the whole country, have great admiration. But the increase here, too, has been less marked, as the war progresses. The number of women adherents to our ranks is now affected by the war in the same way that the number of medical students has been affected. The promise that a useful, responsible, and successful career was offered to them in medicine has been perfectly clear to many women for some time, and in the various centres of secondary education large groups of women had made up their mind before the commencement of the war to avail themselves of that promise. Many of them now, for reasons of the purest patriotism, have sacrificed their ambitions and have decided that the incidence of war has entailed upon them duties of other and every sort to which they must give a preferential claim. Large as the number of women students promises to be, there are many women who have decided that they ought to defer their medical studies rather than interrupt the immediate work upon which they are engaged. It is therefore to a smaller public than ever before that the Students' Number of THE LANCET is directed this year and those who are pursuing their medical studies need from none any urging to diligence and concentrated effort.

In previous issues we have given a full account of the regulations for the entry of candidates for commissions in the Naval, Military, and Indian Medical Services with notes on rank, pay, promotion, retirement allowances, and pensions. The existing circumstances, however, make all such information irrelevant. The section has therefore been omitted as well as the sections on Special Training in Public Health and in Tropical Medicine. The regulations for the obtaining of these supplementary diplomas will be published later. A full account is included of the Colonial Medical Service whose activities have not been similarly curtailed.

The General Council of Medical Education and Registration, commonly known as the General Medical Council, is the controlling authority under the Privy Council of the medical education of the land. Under the provisions of the

Medical Acts various universities and corporations are recognised as being examining bodies whose degrees or diplomas entitle to medical registration, and it is among the duties of the General Medical Council to keep the official register and to ensure by periodical visitations that the tests of the various examining bodies are maintained at a due standard. We begin in the Students' Guide, which follows, by describing the powers of the General Medical Council, and go on to give in detail the regulations of the examining bodies.

The systems under which the medical student obtains instruction do not conform to one pattern. The curriculum falls into two parts, the preliminary subjects and the professional subjects, and the two cannot be sharply divided. The important preliminary subjects are chemistry, pharmacology, physics, biology, anatomy, and physiology, and they are taught in the school proper, the professional subjects, medicine, surgery, and obstetric medicine—under which headings all forms of specialism are included—must be learned in the wards of a hospital. All schemes of medical education require a school and a hospital, and end in the award to the student of a degree or diploma, but there their uniformity ends.

Under their respective headings and subdivisions will be found the chief information concerning the facilities for medical study, and the regulations for examinations at the various teaching centres of the United Kingdom, so that a student desiring to obtain a medical degree at any university will find under one heading an account of the medical faculty of that university, and of the hospitals which form its field for clinical instruction. It is impossible to adhere rigidly to this plan without some overlapping and doubling of information for, as is well known, the medical schools of some universities are served chiefly by hospitals in other centres. Thus the majority of the medical students of Oxford and Cambridge pursue their clinical studies in London and take the diplomas of the English colleges, whilst any student who has gone through all his statutory training in a provincial centre may sit for a medical degree at the University of London. Again when we come to consider the corporations which have the power to grant diplomas qualifying their possessors for the practice of medicine, we find that they usually have no schools attached to them but that they examine students who have gone through the curriculum at any recognised metropolitan or provincial school to the satisfaction of their teachers, and in accordance with the regulations of the corporations.

The Guide is divided into the three headings of England and Wales, Scotland and Ireland, and the medical education in each country is dealt with as a separate entity. First the medical faculties of the universities in each country are described, and then follows an account of the medical corporations having powers to grant diplomas by examination. Under the heading of each university we give a general description of its arrangements for conferring medical degrees, of its facilities for preparing its students for those degrees and particulars of those hospitals affording clinical instruction which are situated in the neighbourhood of the university buildings. An account is also given of the regulations of the various corporations granting diplomas for the practice of medicine and of the system of dental education of the country.

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION OF THE UNITED KINGDOM

POWERS, DUTIES, AND CONSTITUTION OF THE GENERAL MEDICAL COUNCIL

THE powers and duties of the General Medical Council or "General Council of Medical Education and Registration of the United Kingdom" to give the Council its full title, have been set out in detail in many previous Students' Numbers of THE LANCET. It is first a registering body, no person, even though his qualifications have been obtained, is a legally qualified medical practitioner unless his name appears on the Medical Register. Secondly, it is a standardising body, ensuring that the education of medical men is kept up to an efficient standard by scientific examination. Thirdly, it is a penal and disciplinary body, having power to remove from the Register any practitioner adjudged guilty of conduct "infamous in a professional respect." Fourthly to the Council is committed the codification of pharmaceutical remedies.

The duties of the Council are thus primarily of a public nature, and its construction shows its fitness for its fourfold responsibilities.

The Council at present consists of 38 members, of whom, as will be seen by the annexed list, all but 11 are official representatives of some corporate body. Five members are chosen by the Crown on the advice of the Privy Council, and six others are elected by the members of the medical profession as Direct Representatives.

President of the General Council Sir Donald MacAlister, K C B. Members of the General Council Dr Norman Moore, chosen by the Royal College of Physicians of London, Sir Henry Morris, Bart., Royal College of Surgeons of England, Mr George Wilks, M B, Apothecaries' Society of London, Mr Arthur Thomson, M B, University of Oxford, Sir T. Clifford Allbutt, K C B, University of Cambridge, Sir George Hare Philipson, M D, University of Durham, Dr Frederick Taylor, University of London, Dr Grafton Elliot Smith, Victoria University of Manchester, Dr Robert Saundby, University of Birmingham, Dr Richard Caton, University of Liverpool, Dr Alfred George Barrs, University of Leeds, Rutherford John Pye Smith, F R C S, University of Sheffield, Sir Isambard Owen, University of Bristol, and Dr David Hepburn, University of Wales. Dr William Russell, chosen by the Royal College of Physicians of Edinburgh, Mr James William Beaman Hodson, F R C S Edin., Royal College of Surgeons of Edinburgh, David Neilson Knox, M B, Royal Faculty of Physicians and Surgeons of Glasgow, H. Harvey Littlejohn, M B, University of Edinburgh, Sir Donald MacAlister K C B, M D, University of Glasgow, Dr John Theodore Cash, University of Aberdeen, and Dr John Lyle Mackay, University of St. Andrews. Sir John William Moore, chosen by the Royal College of Physicians of Ireland, Sir Arthur Gerald Chance, Royal College of Surgeons in Ireland, Dr Edward Magennis, Apothecaries' Hall of Ireland, Arthur Francis Dixon, M B, D Sc, University of Dublin; Sir Bertram Coghill Alan Windle, M D, National University of Ireland, and Johnson Symington M D, Queen's University of Belfast. Nominated by His Majesty, with the advice of his Privy Council Mr Charles Sissmore Tomes F R C S, Dr Arthur Newsholme C B, Sir Francis Henry Champneys Bart., M D, Dr John Christie McVall, and Dr James Little. Elected as Direct Representatives Dr Langley Browne, Dr H. A. Latimer, Dr J. A. MacDonald, Mr Thomas Jenner Verrall, Dr Norman Walker and Dr Leonard Kidd. Treasurers of the General Council Mr Charles Sissmore Tomes and Sir Henry Morris Bart.

THE EDUCATIONAL CURRICULUM

Professional Education.—The course of professional study after registration occupies at least five years. The Final Examination in Medicine Surgery and Midwifery must not be passed before the close of the fifth academic year of medical study.

Registration and Preliminary Examination of Medical Students.—The following are the General Medical Council's Regulations in reference to the registration of students in medicine—

Every medical student should be registered in the manner

prescribed by the General Medical Council. The Registrar of medical students is placed under the charge of the Branch Registrars. Every person desirous of being registered as a medical student should apply to the Branch Registrar of the division of the United Kingdom in which he is resident, and should produce or forward to the Branch Registrar a certificate of his having passed a preliminary examination as required by the General Medical Council, and evidence that he has attained the age of 16 years, and has commenced medical study at an institution approved by the Council. The Branch Registrar shall enter the applicant's name and other particulars in the Students Register and shall give him a certificate of such registration. Each of the Branch Registrars shall supply to the several licensing bodies, medical schools, and hospitals, in that part of the United Kingdom of which he is registrar, a sufficient number of blank forms of application for the registration of medical students. The commencement of the course of professional study recognised by any of the qualifying bodies should not be reckoned as dating earlier than 15 days before the date of registration. In addition to the universities and schools of medicine there are many institutions where medical study may be commenced. Applications for special exceptions are dealt with by the Students' Registration Committee, which reports all such cases to the Council.

The Preliminary Examination in General Education required to be passed previously to registration as a medical student, is as follows—

1. English language including grammar and composition. Paragraphing questions on the history and geography of Great Britain and Ireland. 2. Latin including grammar translation from unscripted Latin books, and translation of English passages into Latin. 3. Mathematics comprising (a) arithmetic (b) algebra including exponential equations, and (c) geometry: the subject matter of Euclid's Books I, II, and III with simple de surlines. 4. One of the following subjects: (a) Greek (b) a modern language.

In some cases also the Council will not accept certificates without endorsement that all the required subjects are included. For a syllabus or for old examination papers application should be made to the Examining Bodies who can give details as to the requirements in regard to their own examinations.

A degree in Arts of any university of the United Kingdom or of the colonies or any other specially recognised university, or a certificate of having passed the final examination for a degree in Arts or Science of any university in the United Kingdom is considered a sufficient testimonial of proficiency.

Norman C. King, Registrar of the General Council and of the Branch Council for England, 299 Oxford Street, London, W.—James Robertson, Registrar of the Branch Council for Scotland, 54, George Square, Edinburgh.—Richard J. E. Roe, Registrar of the Branch Council for Ireland, 35, Dawson Street, Dublin. All communications should be addressed to 'The Registrar' and not by name.

THE EXAMINING BODIES

The following is a list of Examining Bodies whose examinations in general education are recognised by the General Medical Council as qualifying for registration as a medical or dental student.

In all cases it must be certified that all the required subjects have been passed at not more than two examinations.

Universities in the United Kingdom

University of Oxford.—Senior Local Examinations (Certificates to be endorsed as fulfilling the Council's requirements) Higher Local Examinations (Certificates to be supplemented by others showing that the required mathematical subjects have been passed) Moderation.

University of Cambridge.—Senior Local Examination (Certificates to be endorsed as fulfilling the Council's requirements) Higher Local Examinations. Preliminary Examination. General Examination.

Oxford and Cambridge Schools Examination Board.—Higher Certificate Examination. The School Certificate Examination.

University of Durham.—Matriculation Examination of the Faculties of Medicine, Science, Letters, and Music.

University of London.—Matriculation Examination. Senior School Examination.

1. A special leaflet showing the Council's requirements will be sent on application.

2. For particulars see Regulations in the T. and S.

Victoria University of Manchester, University of Liverpool University of Leeds, and University of Sheffield Joint Matriculation Board of—Matriculation Examination Senior School Certificate (to include (a) English Language and Literature, (b) Latin, (c) Mathematics, (d) Greek or a Modern Language, and (e) and (f) any two other subjects as set out in the Regulations of the Board).

University of Birmingham—Matriculation Examination Senior School Leaving Certificate

University of Bristol—Matriculation Examination School Certificate Examination

University of Wales—Matriculation Examination.

Universities of Scotland—Preliminary Examination of the Joint Board of Examiners of the Scottish Universities for Graduation in Medicine and Surgery Preliminary Examination of the Joint Board of Examiners of the Scottish Universities for Graduation in Arts or Science

University of St. Andrews—Final examination for the diploma of L.L.B.

University of Dublin—(a) Junior Freshman Term Examination (exclusive of Trigonometry). (b) Special Preliminary Examination to be held in March, the standard and subjects of which shall be those of a Junior Freshman Examination (exclusive of Trigonometry). (c) Junior Exhibition Examination on obtaining marks of sufficient merit in the subjects of (a) or (b). (d) Examinations for the first second third, or fourth year in Arts. (Certificate to be signed in the approved form by the Medical Registrar of the University)

Queen's University of Belfast—Matriculation Examination.

National University of Ireland—Matriculation Examination

Government Examinations held in the United Kingdom

School Education Department—Leaving Certificate Examinations passes in Lower Grade Leaving Certificate Examinations Intermediate Certificate

Intermediate Education Board of Ireland—Middle Grade Examination with Honours in three subjects Senior Grade Examinations

Central Welsh Board—Senior Certificate Examinations

Examinations in Chartered Bodies held in the United Kingdom

College of Preceptors—Examinations for the Senior Certificate Preliminary Examination for Medical Students

Educational Institute of Scotland—Preliminary Medical Examination.

Royal Colleges of Physicians and Surgeons in Ireland—Preliminary Examination.

Indian Colonial and Foreign Universities and Colleges

Every Certificate from Indian Colonial and Foreign Universities and Colleges must contain evidence that the Examination has been conducted by or under the authority of the Body granting it must include all the subjects required by the General Medical Council and must state that all the subjects of Examination have been passed in at not more than two examinations, copies of the form of the required Certificate are applied by the Registrar of the Council for the purpose. In the case of Natives of India or other Oriental countries whose vernacular is other than English an Examination in a Classical Oriental Language (e.g. Sanskrit Arabic Chinese) may be accepted instead of an Examination in Latin. The German Abiturienten Examen of the Gymnasien and Real Schulen and the examinations entitling to the French diplomas of Bachelier es Lettres and Bachelier es Sciences and other corresponding Entrance Examinations to the Universities in Europe are recognised by the General Medical Council.

The remainder of the curriculum, though all under the supervision of the Council is in detail in the lists of the various degrees and diploma granting bodies which are representative members of the General Medical Council. In the next place we give the details of the various examining bodies but it must always be remembered that the examinations are under the supervision of the General Medical Council who will be in a position to inquire into the procedure.

THE MEDICAL EXAMINING BODIES AND SCHOOLS OF THE UNITED KINGDOM

A GUIDE TO THE FACILITIES FOR OBTAINING THE VARIOUS
MEDICAL DEGREES AND OTHER QUALIFICATIONS
FOR THE BRITISH MEDICAL REGISTER.

I—ENGLAND AND WALES THE UNIVERSITIES

UNIVERSITY OF OXFORD

THERE are two degrees in Medicine, *B.M.* and *D.M.*, two degrees in Surgery, *B.Ch.* and *M.Ch.*, and two diplomas, *Public Health* and *Ophthalmology*.

Graduates in Arts (*B.A.* or *M.A.*) are alone eligible for the degrees. The most convenient course for the *B.A.* degree for intending graduates in Medicine is to take Responsions, the Preliminary Science Examinations mentioned below, and the Final Honour School of Physiology. In order to obtain the degrees of *B.M.* and *B.Ch.* the following examinations must be passed—1. Preliminary subjects—Mechanics and Physics, Chemistry, Animal Morphology, and Botany. 2. Professional (a) First Examination Subjects—Organic Chemistry, unless the candidate has obtained a first or second class in Chemistry in the Natural Science School, Human Physiology, unless he has obtained a first or second class in Animal Physiology in the Natural Science School, Human Anatomy. (b) Second Examination Subjects—Medicine, Surgery, Midwifery, Pathology, Forensic Medicine with Hygiene, Materia Medica and Pharmacology. The approximate dates of the examinations are as follows—Preliminaries—Mechanics, Physics, and Chemistry, December and June, Animal Morphology, December and March, Botany, March and June, Professional (First and Second *B.M.*) June and December.

The First Examination for the degrees of *B.M.* and *B.Ch.* may be passed as soon as the Preliminary Scientific Examinations have been completed. Anatomy and Physiology are to be passed together, and Organic Chemistry may be taken before or after these have been passed.

The Second Examination may be passed after the completion of the first, but Pathology, Hygiene and Materia Medica and Pharmacology may be taken before or with the remaining subjects. Before admission to the Second Examination candidates must present certificates of attendance on a course of laboratory instruction in Practical Pathology and Bacteriology and of having acted as post-mortem clerk for three months, surgical dresser for six months, and clinical clerk for six months. Also they must produce certificates of instruction in Infectious and Mental Diseases, and of attendance on Labours of proficiency in the practice of Vaccination and Anaesthetics and of having attended a course of Practical Pharmacology. Also in respect of the First Examination candidates must present certificates showing that they have dissected the whole body once and have attended courses of laboratory instruction in Practical Histology and Practical Physiology.

The degree of *D.M.* is granted to Bachelors of Medicine of the University provided they have entered their thirty ninth term and have composed on some medical subject a dissertation which is approved by the professors in the Faculty of Medicine and examiners for the degree of *B.M.* whose subject is dealt with. A book published within two years of the candidate's application for the degree may be substituted for a dissertation. The Pegasus Professor may direct the dissertation to be read in public. The degree of *M.Ch.* is granted to Bachelors of Surgery of the University who have entered their twenty seventh term who are members of the surgical staff of a recognised hospital or have acted as Dresser or House Surgeon in such a hospital for six months, and who have passed the *M.Ch.* examination in Surgery, Surgical Anatomy and Surgical Operations. This examination is held annually in June at the end of the Second *B.M.* Examination.

Diploma in Ophthalmology—There is an examination once in each year in the Theory and Practice of Ophthalmology for the purpose of granting certificates of proficiency therein.

styled Diplomas in Ophthalmology. The examination is under the supervision of the Board of the Faculty of Medicine, which has power to make regulations as to the subjects of the examination, the time at which the examination is held, and the conditions of admission. No candidate is admitted to the examination for the diploma who has not pursued at Oxford a course of study in Ophthalmology approved by the Board of the Faculty of Medicine, and extending over a period of at least three months. The fee for admission to the examination is £15 unless the candidate is a graduate of the University, in which case it is £10 only.

Travelling Fellowship, Scholarships, and Prizes—A Radcliffe Travelling Fellowship is awarded annually after an examination held in February. It is tenable for three years and is of the annual value of £200. The examination is in Physiology, Pathology, and Hygiene, and is partly "practical." Candidates must be graduates in Medicine of the University. The holder must travel abroad for the purpose of medical study. Application should be made to the Radcliffe Examiners, Radcliffe Library, University Museum. A Rolleston Memorial Prize is awarded once in two years to members of the Universities of Oxford and Cambridge of not more than ten years' standing for an original research in some Biological subject, including Physiology or Pathology. The Radcliffe Prize, founded by University College (1907), is of the value of £50 and is awarded biennially for research in some branch of medical science. The Theodore Williams Scholarships of the value of £50 each are awarded annually in the subjects of Anatomy, Physiology, and Pathology. A King's College Hospital Burney Yeo Scholarship of £80 is awarded each year. The Scholarships in Science which are offered by several Colleges are open to those who intend to pursue Medicine. The value of these scholarships is usually £80 a year for four years.

More detailed information may be obtained from the University Calendar, from the Examination Statutes, 1915, from the Student's Handbook to the University (all of which are published by the Clarendon Press), from the Regius Professor of Medicine, and from the Professors in the several departments of medical science.

Professors—Botany (Sherard) S. H. Vines, M.A. Chemistry (Waynflete) W. H. Perkin, D.Sc. Comparative Anatomy (Linacre) G. O. Bourne, D.Sc. Human Anatomy A. Thomson, M.A. Lecturer in Applied Anatomy A. P. Dodds-Parker, B.M. Medicine (Regius) Sir W. Osler, Bart., D.M. Litchfield Lecturer Ernest Mallam, M.D. Surgery, Litchfield Lecturer E. C. Bevers, B.M. Natural Philosophy (Sedleian) A. E. H. Love, D.Sc. Physics (Wykeham) J. S. E. Townsend, M.A. Physiology (Waynflete) C. S. Sherrington, M.D. Zoology E. B. Poulton, D.Sc. Pathology G. Dreyer, M.D. Lecturer E. W. A. Walker, D.M. Morbid Anatomy A. G. Gibson, D.M. Pharmacology (Reader) James Gunn, M.D.

In addition to the University lectures and classes the several Colleges provide their undergraduates with tuition for all examinations up to the B.A. degree.

In the Radcliffe Infirmary and County Hospital clinical instruction is given by the Regius Professor of Medicine, the Litchfield Lecturers in Medicine and Surgery, and the other physicians and surgeons. Instruction is also given in post-mortem work and Clinical Pathology in connexion with the courses in Pathology.

UNIVERSITY OF OXFORD. RADCLIFFE INFIRMARY AND COUNTY HOSPITAL.—Courses of instruction are given in connexion with the Oxford University Medical School. These include (1) a course in Practical Medicine by the Regius Professor of Medicine, (2) Clinical lectures by the Litchfield Lecturers in Medicine and Surgery, and (3) tutorial instruction and demonstrations in special Regional Anatomy (medical and surgical) methods of Medical and Surgical Diagnosis, and Surgical Manipulation. (4) Pathological demonstrations and instruction in post-mortem work are given by the Assistant Pathologist. Practical Pharmacy is taught in the Radcliffe Dispensary. Opportunities are offered to students who wish to act as surgical dressers and clerks. The Hospital contains 170 beds. Honorary Physician Dr. E. B. Grav. Honorary Surgeons Mr. A. Winkfield and Mr. H. P. Symonds. Active Consulting Physician Professor Sir William Osler, Bart. Active Staff—Honorary Physicians Dr. W. Tyrrell Brooks, Dr. W. Collier, and Dr. E. Mallam. Honorary Assistant Physician and

Medical Registrar Dr. A. Waters. Lecturer in Physiology Dr. W. J. Torrell. Honorary Surgeons Mr. R. H. A. Whitelocke, Mr. A. P. Dodds Parker, and Mr. E. C. Bevers. Honorary Assistant Surgeon and Surgical Registrar (Vacant). Consulting Ophthalmic Surgeon Mr. P. E. R. Adams. Honorary Consulting Pathologist Professor G. F. Dreyer. Honorary Assistant Pathologist Dr. A. G. Gibson. Consulting Dental Surgeon Mr. E. A. Bevers. Honorary Radiographer Mr. R. H. Sankey. House Physician Dr. F. Mosse. House Surgeon Mr. D. McDonald. Casualty House Surgeon (Vacant).

UNIVERSITY OF CAMBRIDGE

The student must enter at one of the Colleges, or as a non-collegiate student, and keep nine terms (three years) by residence in the University. He must pass the Previous Examination in Classics, Mathematics, &c., if possible, before he comes into residence in October, or he may obtain exemption through the Oxford and Cambridge Schools Examination Board, the Oxford or Cambridge Senior Local Examinations, the London Matriculation Examination, the Scotch Education Department, Responsions at Oxford, and the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, and Sheffield. The Matriculation Examination of the University of Birmingham, or by being graduates of certain other Universities in the United Kingdom. He may then devote himself to medical study in the University, dissecting, attending the hospital and the medical lectures, &c. Or he may, as nearly all students now do, proceed to take a degree in Arts by passing either (a) the General Examination and the Special Examination or (b) two Special Examinations: the ordinary B.A. degree, or going out in one of the Honour Triposes. The Natural Sciences Tripos is taken most frequently, as some of the subjects are practically the same as those for the first and second M.B.

For the degree of *Bachelor of Medicine (M.B.)* five years of medical study are required either in Cambridge or at one of the recognised Schools of Medicine. The first three or four years are usually spent in Cambridge, the student remaining in the University till he has passed the Tripos and the first and second examinations for M.B. Hospital practice and many of the requisite lectures may be attended in Cambridge, and a certain number of students remain to attend lectures and hospital practice until they have passed the second part of the second examination for M.B. The laboratories for Botany, Chemistry, Physics, Biology, Zoology, Human Anatomy, Physiology, Biochemistry, Pathology, Bacteriology, Pharmacology, Pathology, and Public Health are well equipped. Address: Addenbrooke's Hospital, the Infectious Diseases Hospital, the Cambridge Research Hospital and the Field Laboratories are utilised for study and research.

There are three examinations for M.B. The first includes (1) Chemistry and other branches of Physics and (2) Elementary Biology. These parts may be taken together or separately. The second is divided into two parts: viz., (1) Human Anatomy and Physiology, and (2) Pharmacology and General Pathology. The third is also divided into two parts: (1) Principles and Practice of Surgery (including Special Pathology and Midwifery and Diseases Peculiar to Women), and (2) Principles and Practice of Physics (including Diseases of Children, Medical Diseases, Medical Jurisprudence) Pathology (including Hygiene and Preventive Medicine) and Pharmacology (including Therapeutics and Toxicology). The examinations are partly in writing, partly oral and partly practical in the hospital, in the dissecting room and in the laboratory. An Act has then to be kept in the Public Schools by the candidate reading an original dissertation composed by himself and being examined orally on some subject approved by the Regius Professor of Physics.

Candidates who have passed both parts of the third examination are admitted to the registrable degree of *Bachelor of Surgery (B.S.)* without separate examination and without keeping an Act.

The degree of *Doctor of Medicine (M.D.)* may be taken three years after that of M.B. or four years after that of M.A. The candidate is required to produce evidence of having been engaged in Medical Study for five years.

and if an M.A. some certificates of attendance on Lectures and of attendance on Hospital Practice, and to pass the same examinations as are required for the degree of M.B. An Act has to be kept, consisting of an original Thesis sustained in the Public Schools with viva voce examination, and a short extempore essay has to be written on a topic taken from the general subject of his thesis whether it be Physiology Pathology, Pharmacology, the Practice of Medicine, State Medicine, or the History of Medicine.

For the degree of *Master of Surgery* (M.C.) the candidate must have passed all the examinations for B.C., or, if he is an M.A., have obtained some other registrable qualification in surgery. He is required either (1) to pass an examination in Principles and Practice of Surgery, Surgical Anatomy and Surgical Operations, and Pathology, and to write an extempore essay on a Surgical Subject, or (2) to submit to the Medical Board original contributions to the advancement of the Science or Art of Surgery. Before he can be admitted to the examination two years at least must have elapsed from the time when he completed all required for the degree of B.C. Before submitting original contributions he must have been qualified at least three years.

An abstract of the Regulations and Schedules of the range of the examinations in Chemistry Physics Biology, Pharmacology and General Pathology may be obtained upon sending a stamped directed envelope to the Registrar, the Registrar Cambridge.

The Professors Readers and Lecturers in the various subjects are as follows: Professors—Anatomy A. Macalister, M.D. Biology (Quick) G. H. F. Nuttall Sc.D. Botany A. C. Seward, M.A. Chemistry W. J. Pope M.A. Natural Philosophy (Jacksonian) Sir James Dewar, M.A. Pathology G. Sims Woodhead M.A. Physics (Regius) Sir T. Clifford Allbutt M.D. Physiology J. N. Langley, Sc.D. Surgery (Vacant) Therapeutics (Dorling Professor of Medicine) J. B. Bradbury M.D. Zoology &c. J. Stanley Gardiner M.A. Readers—Botany F. F. Blackman, M.A. Chemical Physiology F. G. Hopkins M.A. Zoology A. E. Shipley Sc.D. Lecturers—Bacteriology Louis Cobbett M.D. Hygiene G. S. Graham Smith M.D. Botany A. G. Tansley, M.A., and R. P. Gregory M.A. Chemistry H. J. H. Featon Sc.D. Organic Chemistry S. Ruhemann M.A. Chemistry and Physics as Applied to Hygiene J. E. Parry M.A. Advanced Morphology of Vertebrates H. Gadow, M.A. Pathology (Huddersfield) T. S. P. Strangeways M.A. Physics G. F. C. Searle Sc.D. and C. T. R. Wilson, M.A. Pharmacology W. E. Dixon M.A. Advanced Physiology L. E. Shore M.D. Physiology W. B. Hardy M.A. Neurology H. K. Anderson M.D. Physiology of the Senses W. H. R. Rivers M.A. Experimental Psychology C. S. Myers M.D. Sc.D. Physical Anthropology W. L. H. Duckworth M.D. Sc.D.

University Prize in Medicine—The one University Prize in Medicine the Raymond Horton Smith Prize (value £19) is awarded to that candidate for the degree of M.D. who presents the best thesis for the degree during the academic year provided that he has taken honours in a tripos examination. Medical Studies are endowed by the numerous Natural Science scholarships at the various colleges. Information about which can be obtained from the respective Tutors.

ADDENBROOKE'S HOSPITAL.—Clinical Lectures in Medicine and Surgery in connexion with Cambridge University Medical School are given at this hospital twice a week during the academic year and practical instruction in Medicine and Surgery is given in the wards and out-patient rooms by the physicians and surgeons daily during the term-time and vacations. The fee for pupilship is 3 guineas a term. Physicians: Professor Sir Clifford Allbutt Professor Bradbury D. I. Humphreys Dr. Lloyd Jones and Dr. Aldren Wagh. Surgeons: Mr. G. E. Wherry Mr. F. Dalton Dr. Griffiths and Mr. Arthur Cooke. All communications should be made to Dr. Wagh.

UNIVERSITY OF LONDON

The University of London was established by Royal Charter in 1275 as an examining and degree-giving body. It was not until 1826 that it began to teach, and in 1830 it was incorporated by Act of Parliament.

1898 and became a teaching as well as an examining body. Many schools already existing became constituent colleges, including all the metropolitan medical schools. Teachers were also appointed in special subjects to give lectures at the University.

Teaching Staff—The teaching staff of the University is organised under two heads: 1. Appointed teachers—i.e., such as are appointed by and are paid out of the funds of the University; 2. Recognised teachers—i.e., those who have been appointed and are paid by the several schools of the University and other institutions at which instruction is given under the auspices of the University, and who have been recognised by the Senate as conducting work of University standard. Courses by non-recognised teachers may also be approved in schools of the University. The lecturers in the Medical Sciences and the professors in the Faculties of Medicine in University College, London, and King's College, London will be found enumerated under their respective medical schools.

Internal and External Students—All the examinations of this University are open to men and women alike. Matriculated students of the University may be either internal or external. Internal students of the University are students who have matriculated at the University and who are pursuing a course of study approved by the University either (a) under the direct control of the University or a committee appointed thereby, or (b) under one or more of the appointed or recognised teachers of the University. Centres for preliminary and intermediate medical studies have been established by the University at University and King's Colleges. Internal students must pursue their studies at one of the above centres or at one of the medical schools connected with the University. These are University College Hospital, King's College Hospital, St. Bartholomew's Hospital, the London Hospital Guy's Hospital St. Thomas's Hospital, St. George's Hospital the Middlesex Hospital, St. Mary's Hospital Charing Cross Hospital Westminster Hospital, and the London (Royal Free Hospital) School of Medicine for Women. The London School of Tropical Medicine and the Lister Institute of Preventive Medicine are also recognised as schools of the University in special departments. External students are all other matriculated students and may pursue their studies at other universities and medical schools presenting themselves for examination at the University of London.

Faculty of Medicine—The Faculty of Medicine grants the joint degrees of M.B. B.S. (*Bachelor of Medicine and Surgery*) and the higher separate degrees of M.D. (*Doctor of Medicine*) and M.S. (*Master of Surgery*).

The curriculum for the medical degrees is now five and a half years from the time of matriculation except in the case of students who have passed the Preliminary Scientific Examination or the First Examination for Medical Degrees before July 1910 and the examinations formerly known as the Preliminary Scientific, the Intermediate, and the Final Examination in Medicine are now respectively entitled the First Second and Third Examinations for Medical Degrees. Part II of the former Preliminary Scientific Examination has now been made Part I of the Second Examination.

A. Internal Students—In order to be admitted to the Bachelor's degrees a student must normally after registration as an internal student, have (1) Attended prescribed courses of study for five and a half years in one or more schools of the University; (2) Passed the following examinations under the conditions mentioned below: (a) The First Examination for Medical Degrees in Inorganic Chemistry Physics and General Biology; (b) the Second Examination for Medical Degrees: Part I, Organic and Applied Chemistry, Part II, Anatomy Physiology and Pharmacology, including Pharmacology and Materia Medica; (c) the Third Examination for Medical Degrees or M.B. B.S. Examination in Medicine including Therapeutics and Mental Diseases Surgery Midwifery and Diseases of Women Pathology Forensic Medicine and Hygiene.

B. External Students—To be admitted to the Bachelor's degrees an external student must (1) have passed the Matriculation examination or have been exempted therefrom under Statute 116 not less than five and a half years previously; (2) have passed subsequent examinations similar to those required of an internal student, and (3) have been examined in professional studies during the five and a half

years subsequently to Matriculation and four and a half years subsequently to passing the First Examination for Professional Degrees at one or more of the medical institutions or schools recognised by this University for the purpose, one year at least of the four and a half years to have been spent in one or more of the recognised institutions or schools in the United Kingdom.

The First Examination for Medical Degrees (Inorganic Chemistry, Physics, and General Biology) will take place twice in each year, commencing on the Monday following Dec 10th and on the second Monday in July. It must as a rule be passed by internal students not less than one academic year after matriculation and by external students not less than nine months after matriculation.

The Second Examination for Medical Degrees (Part I) Organic Chemistry—This examination will take place twice in each year, commencing on the Thursdays following the third Monday in March and the second Monday in July. No candidate will be admitted to this examination within six months of having passed the First Examination. [During the continuance of the war only this examination will be held in December as well as in March and July.]

The Second Examination for Medical Degrees (Part II) takes place twice in every year, commencing on the third Monday in March and on the first Monday in July. The subjects of the examination are Human Anatomy and Embryology, Physiology, and Pharmacology, including Pharmacy and Materia Medica. No candidate shall be admitted to the examination unless he has passed the First Examination for Medical Degrees at least 18 months previously, and has passed Part I of the Second Examination for Medical Degrees.

The Third or M B, B S Examination—The M B, B S examination takes place twice in each year, commencing on the fourth Monday in October and on the first Monday in May. No candidate except those who pass the Preliminary Science or First Examination for Medical Degrees before July will be admitted to this examination within three academic years from the date of passing in Anatomy and Physiology at the Second Examination (Part II), nor unless he has completed that examination together with prescribed courses of study or practice summarised below: (1) Principles and Practice of Medicine, (2) Clinical Methods and Physical Diagnosis, (3) Insanity (with clinical demonstrations at a recognised Asylum), (4) Therapeutics, (5) Vaccination, (6) Principles and Practice of Surgery, (7) Operative Surgery, Surgical Anatomy, Practical Surgery, and the Administration of Anæsthetics, (8) Diseases of the Eye Ear and Throat, (9) Lectures and Demonstrations on Midwifery and Diseases of Women, (10) Practical Midwifery, the conduct of at least 20 Labours, and practice as a Clinical clerk in Gynecological work, (11) Pathology and Bacteriology, (12) work of the Post-mortem room, (13) Forensic Medicine, and (14) Hygiene. He must also have attended the Medical and Surgical practice of a recognised hospital for two years and a course of instruction at a recognised Fever Hospital for two months. He must have had clinical instruction and must have held the posts of medical clinical clerk and surgical dresser for periods of six months each. Candidates will be examined in Medicine (including Therapeutics and Mental Diseases), Pathology, Forensic Medicine and Hygiene, Surgery, Midwifery, and Diseases of Women. The subjects may be divided into two groups—namely (1) Medicine, Pathology, Forensic Medicine and Hygiene, and (2) Surgery, Midwifery,

and Diseases of Women. These groups may be taken either separately or together. The list of candidates who have passed will be published in two parts—namely, an Honour list and a Pass list. Bachelors of Medicine of this University graduated in or before May, 1904, may obtain the B S degree by passing the Surgical part of the M B, B S examination.

Doctor of Medicine—The examination for this degree takes place twice in each year commencing on the first Monday in December and on the first Monday in July. Candidates may present themselves for examination in one of the following branches, namely: (1) Medicine, (2) Pathology, (3) Mental Diseases, (4) Midwifery and Diseases of Women, (5) State Medicine, and (6) Tropical Medicine. Any candidate for the degree of M D may transmit to the Registrar a thesis or published work having definite relation to the branch of Medicine in which he is a candidate, and if the thesis be approved by the examiners the candidate may be exempted from the written examination in the subject.

Master in Surgery—The examination for the degree of Master in Surgery takes place twice in each year and commences on the first Monday in December and on the first Monday in July.

Fees—Matriculation £2, which will be returned if the candidate withdraws his name before the last day of entry. Should he fail to present himself an additional £1 will be charged on subsequent presentation within eight months. £2 will be charged on each subsequent entry. At provincial examinations an additional fee of £1 to £3 is charged by the local authorities at the time of examination. First M B, B S Examination £5 for each entry to the entire examination or £2 each subject if the examination is taken in parts. Second M B, B S Examination Part I £2 repeated on each subsequent entry, Part II £3 for the whole examination. For re-examination in one subject £4. Third (Final) M B, B S Examination £10 for each entry to the whole examination and £5 for examination or re-examination in each group. M D Examination £20, for re-examination £10. M S Examination As for M D.

Full details of the prescribed curricula of study and the names of the recognised Internal and External Schools of the University, can be obtained free on application to the Academic Registrar, University of London, South Kensington, S W.

MEDICAL SCHOOLS OF THE UNIVERSITY OF LONDON¹

ST BARTHOLOMEW'S HOSPITAL AND COLLECT—The hospital contains 757 beds of which 687 are for patients in the hospital at Smithfield and 70 for convalescent patients at Swanley. It receives over 8000 in patients annually and its out-patients and casualties amount to more than 78,000 annually. Special departments have been organised for Diseases of Women and Children, the Eye, Ear, Larynx and Skin as well as for Orthopedic and Dental Surgery, and for Electrotherapeutics and X-ray work. Surgical operations take place every day at 1.30 p.m. and Surgical Consultations are held on Thursdays at the same hour. Medical Consultations are held on Thursdays at 3.15 p.m. The physicians and surgeons deliver clinical lectures weekly during both the winter and the summer sessions. Clinical Lectures on all special subjects are also given. The duties of the physicians and surgeons are made at 1.30.

Ten house physicians and ten house surgeons are appointed annually, and are provided with rooms by the hospital authorities and receive £80 a year a salary. A resident midwifery assistant, an ophthalmic house surgeon and a house surgeon for diseases of the throat, nose and ear are appointed every six months and are provided with rooms and receive a salary of £80 a year. Three resident anaesthetists are appointed annually, and receive salaries of £120, £100, and £100 respectively. An extern midwifery assistant is appointed every three months and receives a salary of £80 a year. The clinical clerks, the obstetric clerks, the clerks to the out-patients, the dressers to the surgical in-patients, and the dressers to the out-patients, and the dressers in the special departments are chosen from the students. A residential clerk is attached to the hospital.

¹ During the continuance of the war students who have not passed the Second Examination for Medical Degrees in Anatomy and Physiology but who have completed one year's study after passing the First Examination for Medical Degrees will be allowed to count not more than six months service as clinical clerk or not more than six months service as surgical dresser in a recognised hospital as if they had so passed the examination in question. Clinical service during the continuance of the war for any period of not more than twelve months in a medical Unit of the Regular or Territorial Forces or in a hospital or detachment of the Red Cross Society or in any hospital recognised by the military or naval authorities for war purposes will be accepted by the University as equivalent to the medical and surgical practice in a recognised hospital for an equal period and further any portion of the whole of the time so spent will be accepted as equivalent to time spent either as a clinical clerk or as a dresser at the choice of the candidate. Clinical service during the continuance of the war, as set forth above will be similarly accepted for a period not exceeding six months from students who have not passed the Second Examination for Medical Degrees in Anatomy and Physiology but who have completed one year of study after passing the First Examination for Medical Degrees, as if they had so passed the examination in question.

¹ For Ancillary Metropolitan Medical School, see p. 359.

New Buildings—The new buildings comprise residential quarters for the resident staff, casualty, medical, surgical, and special out-patient departments, casualty wards, dispensary and clinical lecture theatre. A new chemical laboratory has been added to the Medical School and a laboratory devoted to instruction in Public Health. A second new block is devoted to Pathology, and contains the post mortem room as well as extensive laboratories for bacteriology, clinical pathology, pathological histology, and pathological chemistry. The Medical School Buildings include three large lecture theatres, a large dissecting room, a spacious library (containing 13,000 volumes), a well appointed museum of anatomy, physiology, comparative anatomy, materia medica, botany, and pathological anatomy. The pathological museum is the most complete in the kingdom. There are laboratories for chemistry, physiology, pharmacology, physics, public health, and biology, giving ample accommodation in every department.

Special Classes for the Primary and Final F R C S are held twice yearly. Instruction in Preliminary Science is given to University of London students in chemistry, biology, and physics throughout the year. Laboratory instruction for the D P H is provided during the winter and summer sessions.

The recreation ground of 10 acres is at Winchmore Hill for the use of the members of the Students Union, which all students are expected to join. The Students Union contains a large reading and smoking room, a committee and writing room, luncheon and dining hall, and a miniature rifle range.

Staff—Consulting Physicians: Sir William Church, Dr Hensley, Sir Lauder Brunton, F R S, Sir Dyce Duckworth, Dr N Moore, Dr S West and Dr Ormerod. Consulting Physician Accoucheur: Sir Francis Champneys. Consulting Surgeon: Mr H Cripps. Consulting Aural Surgeon: Mr Cumberbatch. Physicians: Sir Wilmot Herringham, Dr Tooth, Dr Garrod, F R S, Dr Calvert and Dr H M Fletcher. Surgeons: Sir Anthony Bowlby, Mr D Arcey Power, Mr Waring, Mr McA Eccles, and Mr Bailey. Physicians with charge of Out-patients: Dr Drysdale and Dr Hartley. Assistant Physicians: Dr Horder, Dr Langdon Brown and Dr Thursfield. Surgeons with charge of Out-patients: Mr Rawling, Mr Gask and Mr G Watson. Assistant Surgeons: Mr H W Wilson, and Mr W G Ball. Physician Accoucheur: Dr Griffith. Physician Accoucheur with charge of Out-patients: Dr Williamson. Assistant Physician Accoucheur: Dr Barris. Ophthalmic Surgeons: Mr Jessop and Mr Holmes. Spicer Surgeon for Diseases of the Throat and Nose: Mr Harmer. Assistant Surgeon for Diseases of the Throat and Nose: Mr Rose. Aural Surgeon: Mr C E West. Assistant Aural Surgeon: Mr S R Scott. Dental Surgeons: Mr Ackland and Dr Austen. Assistant Dental Surgeons: Mr F Coleman and Mr J G A Fairbank. Orthopaedic Surgeon: Mr Flimelle. Physicians for Diseases of Children: Dr Fletcher and Dr Thursfield. Physician for Diseases of the Skin: Dr Adamson. Medical Officer in charge of Electrical Department: Dr Cumberbatch. Medical Officer to the X Ray Department: Dr Walsham. Pathologist: Dr F W Andrews, F R S. Assistant Pathologist: Dr Gordon. Administrators of Anesthetics: Mr Cross, Mr Boyle and Mr Tremble. Medical Registrars: Dr C M H Howell and Dr Gow. Surgical Registrars: Mr Blakeway and Mr Roberts. Casualty Physicians: Dr Feiling and Dr Trevan. The staff deliver the lectures and demonstrations in their subjects.

Other lecturers and demonstrators are—Practical Midwifery: Dr W Donaldson. Chemical Pathology: Mr Wallis. Clinical Pathology: Dr Stanfield. Mr Vick. Dr Cantt. Mr Davis. Dr T H G Shore, and Mr Junt. Mental Diseases: Dr Armstrong Jones. Forensic Medicine: Dr R A Lester. Surgical Anatomy: Dr Macphail. Practical Anatomy: Mr Sander and Mr Storen. General Anatomy and Physiology: Dr F A Bainbridge. Practical Physiology: Dr Trevan. Materia Medica: Pharmacology and Therapeutics: Dr Hamill. Biology: Dr Shore and Dr Carrington. Chemistry: Dr Hardier. Practical Chemistry: Dr Hurter. Mr Cahen. Physics: Mr Womack. Practical Physics: Mr Womack and Mr Hopwood. Public Health: Dr Trevan. Museum Curator: Dr Andrews. Junior Curator: Mr Armstrong. Dean of the Medical School: Dr Shore. Warden of the College: Mr W G Ball.

Scholarships given in aid of Medical Study—At this school various Scholarships, prizes, &c., are given. For five of the Scholarships and the Exhibition—namely, (a), (b), (c), three Entrance Scholarships of the respective values of £75, £75, and £150, (d) Entrance Scholarship in Arts, £100, (e) Jeaffreson Exhibition £50, and (f) Shuter Scholarship, £50—a full or University course at St Bartholomew's Hospital is required. The awards of (a), (b), and (c) are made after examination in selections from the subjects of Chemistry, Physics, Zoology, Botany, Physiology, and Anatomy, (d) and (e) are awarded after examination in Latin, Mathematics, and Greek or French or German, (f) is awarded after competitive examination among Cambridge Graduates in Anatomy and Physiology. These remaining Scholarships and prizes are as follows—Four Junior Scholarships: (g) No 1, £30, Anatomy and Physiology, (h) No 2, £20, Anatomy and Physiology, (i) No 3, £25, Chemistry, Physics, and Biology, (j) No 4, £15, Chemistry, Physics, and Biology, (k) Senior Scholarship £50, Anatomy, Physiology, and Chemistry, (l) Kirkes Scholarship, £30 and medal, Clinical Medicine, (m) and (n) two Brackenbury Scholarships, £39 each, one in Medicine and one in Surgery, (o) Sir G Burrows Prize £10, Pathology, (p) Skynner Prize, 13 guineas, Regional and Morbid Anatomy, (q) Matthews Duncan Medal and Prize, £20, Midwifery and Gynaecology, (r) Luther Holden Research Scholarship in Surgery awarded by election, £105, and (s) Lawrence Research Scholarship and gold medal in Pathology, awarded by election, £115.

CHARING CROSS HOSPITAL—The Hospital to which the School is attached, contains 300 beds. Over 3000 cases pass through its wards each year and some 24 000 out-patients and casualties are treated. There are special departments for Mental Diseases, Midwifery, Diseases of Women of Children, of the Skin, Eye, Ear, Throat, Nose, and Teeth for Orthopaedic Cases, X Ray work, and for Electrical Examination and Treatment.

Appointments—In the Medical School Demonstratorships and Assistant Demonstratorships are open to students of the School. Medical, Surgical, and Obstetric Registrars to the Hospital are appointed annually. Six House Physicians, six House Surgeons, and two Resident Obstetric Officers are appointed each year after competitive examination.

Primary and Intermediate Studies—These are taken in the laboratories of the University of London (King's College), situated within a few minutes walk of the school and hospital.

Final Studies—These are taken in the school and hospital, where systematic lectures, demonstrations and tutorial classes are arranged to cover all the subjects necessary for qualifying examinations. Departments are also available for other final subjects of Bacteriology, Clinical Pathology, Materia Medica, Toxicology, Public Health, and Operative Surgery, and also for Research Work and Post-graduate Work.

Public Health Laboratories—The fine laboratories of the School have been taken over by the University of London (King's College) to which a full professional and teaching staff has been transferred. The course of instruction for the Diploma of Public Health is given in these laboratories.

The Museum contains over 4000 specimens including a notable collection of over 800 gynaecological specimens, "The Cathbert Locker Collection".

Students Club—The social comfort and convenience of students are met by library, reading and smoking rooms, refreshment-room &c. The Club which is under the control of a Committee of Students provides needful athletics recreation and includes the Medical Society.

Women Students—The Council of the Hospital has recently decided to throw open the Medical School and Hospital to women students. They are received upon the same terms and conditions as men.

Fees—An entrance fee of 10 guineas and 8 guineas is payable by full course and final course students respectively and an annual fee of 25 guineas covers all other expenditure, with the exception of 7 guineas for vaccination, dispensing, and fever hospital attendance which must be taken outside the hospital. Membership of the Students Club is included in these fees.

Consulting Physicians: Dr T H Green, Dr J Mitchell Bruce and Dr F W Moore. Physicians: Dr J Galloway, Dr W Hunter and Dr W C Bosanquet.

Assistant Physicians Dr W J Fenton, Dr D Forsyth, Dr R C Jewesbury, and Dr G Holmes Consulting Obstetric Physicians Dr J W Black and Dr A Routh Consulting Surgeons Mr R Barwell, Mr J A Bloxam, and Mr J H Morgan Surgeons Mr H F Waterhouse, Mr C Gibbs, and Mr H S Ologg Surgeons to Out-patients Mr P L Daniel and Mr W S Fenwick Consulting Dental Surgeon Mr J Fairbank Ophthalmic Surgeon Mr E T Collins Obstetric Physician Dr T W Eden Assistant Obstetric Physician Dr C Lockyer Physician for Diseases of the Skin Dr J M H MacLeod Consulting Physician for Mental Diseases Dr C Mercier Physician for Mental Diseases Dr E D Macnamara Orthopaedic Surgeon Mr H A T Fairbank Nose and Throat and Ear Surgeons Mr E B Waggett and Mr E D Davis Medical Officer Roentgen and Electrical Department Dr W Ironside Bruce Surgeon Dentist Mr J F Colyer Anaesthetists Mr C O Braine, Dr V A L E Corbould, Dr B E Potter, and Mr G R Phillips Curators and Pathologists Dr R O Jewesbury and Dr G Holmes Bacteriologist Dr W W O Topley

The lectures and demonstrations are delivered by the Staff on their respective subjects Other lecturers and demonstrators are—Tropical Diseases Sir Patrick Manson and Mr J Cantlie Medical Jurisprudence Dr W A Brend Toxicology Dr H F Morley

Further information may be obtained on application to the Dean, Dr W J Fenton, Medical School, Charing Cross Hospital, London, W C

ST GEORGES HOSPITAL—This hospital has a service of 436 beds, of which 180 are allotted to surgical, 160 to medical cases, and 100 are at the Convalescent Hospital at Wimbledon One ward is set apart for Diseases Peculiar to Women Children's beds are placed in all the women's wards Two wards are allotted to ophthalmic cases

Entrance Scholarships and Endowed Places of a total value of £482 are awarded annually, a detailed list is placed below The entire teaching and laboratories are now devoted to purely clinical subjects and arrangements have been made with the University of London for students who enter during the first, second, or third year of the curriculum as students of St Georges to carry out the necessary courses of instruction at either University College or King's College Students then complete their course, without payment of any entrance fee in a school entirely devoted to Clinical work The school is admitting a strictly limited number of women students during the war These women students will be allowed to continue their studies until qualification

Eight house physicians and eight house surgeons are appointed annually All house appointments are open without fee to every perpetual student of the hospital and are made strictly in accordance with the merits of the candidates Special attention is directed to the following paid appointments, among others, which are open to students after they have held house office—Medical Registrarship at £200 per annum, Surgical Registrarship at £200, Assistant Curatorship of the Museum at £100, Obstetric Assistantship (Resident) at £50, the post of Resident Anaesthetist at £100, the post of Senior Anaesthetist at £50, the posts (3) of Junior Anaesthetists, each at £30 Great attention is paid by members of the staff to individual teaching A number of special courses are given in which the requirements of university and other examinations receive careful attention The following may be cited as examples—(1) Elementary Bacteriology, (2) Advanced Bacteriology, (3) Clinical Pathology, (4) Systematic Pathology, (5) Histological Pathology and Morbid Anatomy, (6) Pharmacology, (7) Surgical Anatomy, (8) Advanced Anatomy and Physiology, (9) Operative Surgery, (10) Public Health, and (11) Tropical Diseases Special classes are held by members of the staff for all examinations The St. George's Hospital Club with smoking and luncheon rooms on the hospital premises and an athletic ground at Wimbledon, is an amalgamation of the Hurlerian Society the Gaette and the chess lawn tennis, boxing, hockey rifle and golf clubs Students have the advantage of a library of medical and scientific books which is kept up to-date A register of accredited apartments and a list of medical men and others willing to receive St Georges men as boarders may be seen on application to the Dean Further information may be obtained from the Dean of the Medical School

Staff—Consulting Physicians Dr T T Whigham, Isambard Owen, and Dr W Ewart Consulting Surgeon Mr Pick, Mr Haward, Sir W Bennett, Mr Marmada Sheild, and Mr F Jaufrey Consulting Obstetric Physician Dr W R Dakin Consulting Ophthalmic Surgeons V Brudenell Carter and Mr Adams Frost Consulting Assistant Surgeons Sir William Dalby and Mr W C Bull Consulting Dental Surgeon Mr Winterbottom Consulting Bacteriologist Dr Charles Slater Physicians D H Rolleston, Dr O Ogle, Dr A. Scholarships—Five entrance scholarships are awarded annually as follows—(a) one scholarship of £100 for students under 21 years of age Latin English Greek or French or German Arithmetic Euclid and Algebra, (b) one scholarship for students under 21 years £120 Inorganic Chemistry Physics and Biology, (c) a Scholarship of £50 open to candidates under 21 years of age to be awarded either in Arts or in Science according to the discretion of the Examiners and to the percentage of the marks obtained (d) two scholarships one of £75 and one of £35 for students under 25 years of age who have completed the curriculum for or passed the examination in Anatomy and Physiology for a medical degree in any University of the British Empire Subject Any two of the following Anatomy Physiology Pharmacology General Laboratory Organic Chemistry

UNIVERSITY OF LONDON, KING'S COLLEGE—The medical department (Faculty of Science Medical Division) at this College only deals with Intermediate and Intermediate subjects, and instruction in these subjects is given in the College

laboratories by university professors and their assistants. The following four hospital schools prepare their students only for the final examinations—viz., King's College Hospital, Westminster Hospital, St George's Hospital, and Charing Cross Hospital—sending them to King's College for the earlier part of the curriculum. The department is open to both men and women. The Anatomy Section will, from next session, admit women students up to 20 in number.

The following are the teachers in the subjects concerned—Anatomy Dr E Barclay Smith (Professor) Dr Gladstone, and Demonstrators Physiology Dr W D Halliburton (Professor) Dr Rosenheim and Dr Locke (Readers) and Dr de Souza (Lecturer) Psychology Dr W Brown (Reader) Pharmacology Dr W E Dixon (Professor) Zoology Dr A. Dendy (Professor) Botany Dr W B Bottomley (Professor) Chemistry Mr H Jackson (Daniell Professor), Dr Crossley (Professor) Mr P H. Kirkaldy (Assistant Professor) with Lecturers and Demonstrators Physics Dr O W Richardson (Wheatstone Professor), with Lecturers and Demonstrators

Fees—For London University course For First examination for medical degrees, 25 guineas, for the Second examination, 58 guineas, or two instalments of 30 guineas each For Conjoint Board course For First examination, 20 guineas, for Second examination, 58 guineas or two instalments of 30 guineas each For prospectus and further information application should be made to the Dean of the department (Professor Halliburton)

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL—The advanced subjects in the curriculum are dealt with at the Medical School attached to King's College Hospital which is situated at Denmark Hill, S.E. The new hospital stands in the midst of a South London population from which an immense amount of clinical material is forthcoming an average of 3500 out-patients being dealt with weekly. There are 350 beds available for in-patients, and provision will ultimately be made for 600 beds. The hospital contains special departments for diseases of women and children and of the eye, ear, throat and nose, skin, and teeth. There is a special department of radiography radio-therapy, and radium therapy, and recently a department of massage medical gymnastics and electro-therapeutics has been developed. There are special operation theatres for diseases of women for eye and for throat nose, and ear cases. There is a clinical pathologist, and a laboratory in the hospital where histological bacteriological, hematological and chemical investigations are carried out. The appointments open to students are those of senior clinical assistant to the special departments, medical, surgical, and obstetric tutorships, resident casualty officer, resident anaesthetist, resident assistant pathologist, and medical, surgical, and obstetric registrarships. There are 16 resident medical and surgical officers appointed yearly, and the usual senior surgical dressers medical and obstetric clinical clerks surgical dressers and clerks and dressers in all the special departments for in and out-patients and post-mortem clerks.

Hospital Staff—Consulting Physicians Dr Greville Macdonald Sir David Ferrier and Sir Hugh Beevor Consulting Surgeon Mr A B Barrow Consulting Aural Surgeon Dr Urban Pritchard Physicians Sir Nestor Tirard Dr Norman Dalton Dr Raymond Crawford Dr Aldren Turner Dr F W Tannichiffe and Dr J C Briccoe Assistant Physician Dr H W Wiltshire Surgeons Sir W Watson Cheyne Bart Mr A Carless Mr F F Burghard and Mr G L Cheate Assistant Surgeons Mr T P Legg and Mr Arthur Edmunds Obstetric and Gynaecological Surgeon Dr Hugh Playfair Assistant Obstetric and Gynaecological Surgeon Dr W Gilliat Physician for the Diseases of Children Dr George F Still Assistant Physician for Diseases of Children Dr R. S. Frew Surgeon for Diseases of the Throat Sir S. Clair Thomson Assistant Surgeon for Diseases of the Throat Dr C W M Hope Ophthalmic Surgeon Mr I V Carnill Assistant Ophthalmic Surgeon Dr H Willoughby Lyke Aural Surgeon Mr Arthur H Cheate Assistant Aural Surgeon Mr G J Jenkins Physician for Diseases of the Skin Dr A Whitfield Physician for Tropical Diseases Sir Ronald Ross Dental Surgeon Mr C E Wallis Assistant Dr J F W Silk and Dr G B Flux Assistant Anaesthetist Mr Cecil Hughes Radiographer Dr Robert

Knox Clinical Pathologist **Dr d'Este Emery** Pathological Registrar **Dr R S Frew** Medical Tutor **Dr A S Woodward** Surgical Tutor **Mr E G Gauntlett** Obstetric Tutor **Dr W Gillhatt** **Sambrooke** Registrars **Dr G W Shore** and **Mr J Everidge** Obstetric Registrar **Mr A C McAllister** The staff deliver the lectures and demonstrations in their subjects

Other lecturers and demonstrators are—**Psychological Medicine** **Dr Steen** **Forensic Medicine** **Dr W R Smith** **Hygiene** **Dr W J R Simpson** **Surgical Applied Anatomy** **Mr G J Jenkins**

Fees—The composition fee for Hospital work and Final subjects of the curriculum is 70 guineas if paid in one sum, or 72 guineas if paid in two instalments. For information and prospectus application should be made to **Dr H W Lyle**, Dean of the Hospital, or to **Mr S C Ranner, M A**, Secretary of the Medical School **Denmark Hill, S E**

Scholarships and Prizes—For the first two scholarships in the list here shown a complete course at King's College is required. The money value and subjects of examination are as follows—(a) Two **Warneford** Scholarships, tenable for four years, £25 each per annum, (b) **Sambrooke** Scholarship, £50, (c) **Rabbeith** Scholarship, £20, (d) **Medical Entrance Scholarships**, £50, **Anatomy and Physiology**, and, £50, **Pathology and Pharmacology**, open to students who (1) propose to take a degree at any British University and have passed their University examination in **Biology Chemistry, and Physics**, and who (2) will become students at King's College Hospital from date of entering upon Scholarship, (e) Two **Medical Entrance Scholarships** one in **Arts** and one in **Science**, £50 each tenable for five years, successful candidates to study at King's College and King's College Hospital, (f) Three **Medical Scholarships**, £40 for fifth year students, £30 for third year students and £20 for second year students, (g) Two **Sambrooke** Registrarships, open to matriculated students who have filled certain appointments in hospitals, £50 each, (h) **Carter Prize**, £15, **Botany**, (i) **Tanner Prize**, £10, **Obstetrics and Diseases of Women**, (j) **Todd Prize**, £4 4s and medal, **Clinical Medicine**, (k) Two **Burney Yeo Entrance Scholarships**, £80 each, open to students of Oxford and Cambridge

Athletics—The King's College Hospital Clubs and Societies Union was formed in 1908, and consists of the **Lustrian and Musical Societies** the **Hospital Common Room** and the various athletic and sports clubs. Admirable playing fields over six acres in extent, have been provided for the use of the students on **Dog Kennel Hill, Lordship-lane, S E**, about ten minutes' walk from the hospital. There are also **Tennis Courts** in the grounds of the Hospital and of "The Platanes," the hall of residence for students belonging to the hospital.

LONDON HOSPITAL—The hospital has 922 beds in constant use and no beds are closed. It is the only general hospital for East London—i.e., for a million and a half people. In patients last year, 18 933, out-patients 149,507, accidents 8578, major operations 6480. From the beginning of the war to the close of 1915 3277 military patients were admitted, while naval patients (who were first admitted at the end of September) totalled 375. Wards containing 16 beds have recently been provided for the treatment of syphilis, and it is estimated that 2000 patients will pass through in the course of a year. Owing to the enormous number of patients more appointments are open to students than at any other hospital. 141 qualified appointments are made annually and more than 150 dressers, clinical clerks, &c., appointed every three months. All are free to students of the College. Holders of resident appointments have free board. Special classes are held for the degrees of the University of London. The Fellowship of the Royal College of Surgeons and other higher examinations. Special entries for medical and surgical practice can be made. The Students' Hostel provides accommodation for 30 students. The Clubs Union Athletic Ground is within easy reach of the hospital. The Metropolitan and other railways have stations close to the hospital and the college.

Staff—Consulting Physician **Dr Warner** Consulting Surgeons **Mr Couper** **Mr McCarthy**, **Sir Frederick Treves** **Bart.**, **Mr Tay** **Mr Mansell Moullin** **Mr Harry Fenwick** **Mr Dean** and **Sir Frederic Eve** Consulting Obstetric Physician **Dr Lewers** Consulting Dental Surgeon **Mr Barrett** Consulting Aural Surgeon **Mr Mark Howell**

Physicians **Dr Percy Kidd**, **Dr Frederick J Smith**, **Dr W J Hadley** **Sir Bertrand Dawson**, **Dr Henry Hial**, **Dr Robert Hutchison**, **Dr Lewis Smith**, **Dr Cecil Wall** **Dr O Leyton** and **Dr T Thompson** Assistant Physicians **Dr C H Miller** Surgeons **Mr J Hutchison** **Mr T H Openshaw**, **Mr P Furnhill**, **Mr Rigby**, **Mr Sherren**, and **Mr Lett**, Assistant Surgeons **Mr Russell Howard** **R Warren**, **Mr Frank Kidd**, **Mr R Milne**, **Mr A J Walton**, and **Mr H S Souttar** Obstetric Physician **Dr H R Andrews** Assistant Obstetric Physician **Dr E L Holland** Physician to Cardiac Department **Sir James Mackenzie** Demonstrator **Dr J Parkinson** Physician to the Skin and Light Department **Dr J H Sequeira** Ophthalmic Surgeons **Mr A B Roxburgh** and **Mr W T Lister** Surgeon to the Throat Department **Dr Lambert** Lack Demonstrator **Dr N Patterson** Aural Surgeon **Mr Hunter Tod** Surgeon in charge of the Orthopaedic Department **Mr T H Openshaw** Dental Surgeons **Mr H Chapman**, **Sir Francis Farmer**, **Mr G Northcroft** **Mr Paton Pollitt**, **Mr Evelyn Sprawson**, and **Mr Wilton Trow** Medical Officer in charge of the Radiographic Department **Dr Gilbert Scott** Medical Officer in charge of the Electro- and Physio-Therapeutical Departments **Dr R S Wood** Analyst to the Hospital **Mr Hugh Candr** Demonstrator in Chemistry **Mr J F Twort** Bacteriologist to the Hospital Professor **W Bulloch** Assistant Bacteriologist **Dr P Fildes** Demonstrator **Dr L W Rajchman** Inoculation Department **Dr G T Western** Pathological Institute **Dr H M Turnbull**, Director, **Dr G D Bartlett**, Assistant Director, **Dr W W Woods**, Junior Assistant Director, **Clinical Pathologist** **Dr P V Pantou**, Assistant, **Dr H L Tidy** Anaesthetists **Dr Probyn Williams**, **Mr Clapham**, and **Mr Dair** Assistant Anaesthetists **Dr Austin Cooper** and **Mr J D Lyle**

The staff deliver the lectures and demonstrations in their subjects. Other lecturers and demonstrators are **Anatomy** Professor **W Wright**, **Dr N O Rutherford** and **Mr L J Austin** **Physiology and Histology** Professor **E P Cathcart** and **Mr I Feldman** **Physics** **Dr A H Fison** and **Mr W A M Smart** **Biology** **Mr G P Mudge** and **Mr G. T Cunningham** **Mental Diseases** **Dr J Kennedy** **Will Materna Medica and Pharmacy** **Dr E Mellanby** and **Mr F A Hocking** **Aural Surgery** **Dr F F Mnecke** **Obstetric Tutor** **Dr S G Luker** **Dean** Professor **William Wright**, **M B**, **D Sc**, **F R C S** Secretary of College **Mr E J Burdon**

Scholarships and Prizes—At this school the successful candidates for the first items in the list here shown must enter as full students. The value and the subjects of examination are as follows—**Prize Scholarship** £100, and one **Entrance Scholarship** of £50, subjects (1) **First Medical Examination** at the University of London, **Epsom College Scholarship**, free education, subjects of **First Medical Examination** as above, **Prize Scholarship** open to students of Oxford and Cambridge Universities £52 10s, **Human Anatomy and Physiology**, **Barton Scholarship**, £31 10s, subjects of **Preliminary Examination** in Arts, three Scholarships for **Clinical Work** £20 each **Medicine, Surgery, and Obstetrics**, **Tutton Prize** £20, **Pathology**, **Duckworth Nelson Prize** biennial £10 **Pathology, Practical Medicine and Surgery**, **Letheby Prize** (2) £25, **Chemistry**, £25 in **Anatomy and Physiology**, eight **Dressers' Prizes** amounting to £40 each efficient and knowledge of **Elementary Clinical and Minor Surgery**, **Hutchinson Prize** triennial £40 **Clinical Surgery**, two **Practical Anatomy Prizes** £6 and £4 respectively, **Andrew Clark Prize** biennial, £26 **Clinical Medicine and Pathology**, **James Anderson Prize** £9 **Elementary Clinical Medicine**, **Wynne Baxter Prize** £5 5s, **Forensic Medicine**, and **Letheby Prize** triennial £120, subject for 1917 the **Etiology of Rheumatic Fever**

Medical Research Funds—Research Funds of £2160 including the **Eliza Ann Alston Endowment Fund** for Medical Research provide valuable scholarships for men wishing to undertake research or desirous of preparing Theses for University degrees

ST MARY'S HOSPITAL.—305 beds 31 of which are in the Clarence Wing and are devoted to cases requiring treatment by therapeutic inoculation. The number of in-patients treated during 1915 was 3703. The number of out-patients was 17 659 with 23,715 casualty cases at the

of 38 284 The situation of the hospital and Medical School in the centre of the residential districts of Paddington, Bayswater, and North Kensington renders it exceptionally convenient for students rooms, a register of which is kept by the authorities for the use of students

Laboratories &c.—The Medical School provides for the entire curriculum Special laboratories are in use for Biology Chemistry, and Physics, a series of lecture theatres and laboratories for Anatomy and Physiology and a spacious and well lighted dissecting room. The Pathological Department is under the direction of Dr B H Spilsbury, and a block of consulting rooms and laboratories in the New Wing of the Hospital has been equipped for the department of Therapeutic Inoculation to meet the increased amount of work in that department A special laboratory is provided for the study of chemical pathology

Appointments.—All clinical appointments in the hospital are free to students of the Medical School and the resident medical officers are chosen by competitive examination Six house physicians, six house surgeons four obstetric officers, and two Resident Medical Officers for the Inoculation Wards are appointed in each year and receive board and lodging in the hospital Two resident anaesthetists are appointed in each year and receive a salary at the rate of £100 per annum, with board and lodging Four casualty house surgeons are appointed in each year upon the same conditions Several assistants in the department of Therapeutic Inoculation are appointed annually at salaries of £100 per annum and upwards, the total sum available for salaries of assistants in this department being £1600 per annum In addition to the above, the senior appointments medical, surgical and obstetric registrar casualty physician demonstrator of anatomy physiology and biology are made annually Two assistant pathologists are also appointed annually and are eligible for re-election

Clubs &c.—The amalgamated clubs include all the various athletic clubs, as well as the medical society, &c. There is a students club on the Hospital premises the membership of which is included in the amalgamated clubs The athletic clubs ground is situated at Park Royal Action and is easy of access from the Medical School It consists of Rugby and Association football grounds tennis courts and a large cricket pitch and has a large and well equipped pavilion At the present time the pavilion and the greater part of the ground have been commandeered by the War Office

Special Tuition.—In addition to systematic courses of lectures and demonstrations special tuition is provided for the Intermediate and Final Examinations of the Universities of Oxford Cambridge and London and for the Primary and Final F.R.C.S.

The composition fee for full students is £140 if paid in one sum or £145 if paid in four instalments University students who have completed their examinations in Anatomy and Physiology are admitted on payment of a composition fee of 65 guineas (£53 5s) paid in one sum or by payment of two annual instalments of 40 guineas (£42) and 30 guineas (£31 10s) respectively A system of annual fees is also in force as an alternative to composition fees University students who have not completed their examination in Anatomy and Physiology pay revision fees until they have passed these examinations and then pay the composition fee. Separate courses of lectures laboratory work or hospital practice may be taken The School Calendar and full information can be obtained from the Secretary S Marys Hospital Medical School Paddington W

Consulting Physicians. Dr Iuf Consulting Surgeons Mr Herbert Laze Mr A J Pepper Sir G Andersen Citchett Bart and Mr H E Juler (Ophthalmic) Sir Malcolm Morris (Skin) Dr Science (Throat) and Dr M Handfield Jones (Obstetric). Assistant Director Captain S R Douglas, I.M.S. Medical Officer in charge of X Ray Department Dr Harrison Orton Dean Sir John Broadbent

The staff deliver the lectures in the respective subjects, assisted by the following lecturers and demonstrators — Pathology Dr Spilsbury and Dr Kettle Bacteriology Dr Freeman and Mr Fleming Demonstrator in Pathological Chemistry Mr J Webster Descriptive and Surgical Anatomy Professor J Ernest Frazer, Demonstrators Dr R H Robbins and Mr Kenneth Lees Physiology and Histology Dr H E Roaf and Dr Ellison Biology Mr W Repton Chemistry Dr P Haas demonstrator, Mr J O F Fletcher Physics Mr W H White Mental Diseases Dr R H Cole Diseases of the Eye Mr Leslie Paton and Mr Juler Medical Registrar Dr H G P Castellain Surgical Registrar Mr K A Lees Practical Pharmacy Mr E A Andrews School Secretary Mr B E Matthews

Scholarships and Prizes.—The money value and subjects of examination of these are as follows (a) and (b) Entrance Scholarship in Natural Science, £100 and £50 respectively awarded by competition in September, (c) the Frederic John Palmer Scholarship in Natural Science £25, (d) University Scholarship in Natural Science open to members of Oxford or Cambridge University £52 10s, (e) University Scholarship in Natural Science open to members of any British University £52 10s, (f) Epsom Scholarship awarded by nomination £52 10s (g) Gold Medal £20 an Essay on Some Special Point in Clinical Medicine, (h) Dermatology Prize awarded twice in each year £5 5s, (i) Meadows Prize awarded in alternate years £8 Obstetric

MIDDLESEX HOSPITAL.—The Hospital and Medical School are situated in Mortimer street, at the top of Berners-street and only a few minutes walk from Goudge street Station (Hampstead and Charing Cross Tube) Oxford Circus Stations (Bakerloo and Central London Tubes) and Portland Road Station (Metropolitan Railway)

The hospital contains 447 beds including special wards for Cancer Cases Maternity and Gynaecological Cases and for Diseases of Children and the Skin and Eye

The Cancer Charity containing 92 beds and Special Investigation Laboratories offers unrivalled opportunities for the study of Cancer both in its clinical and pathological aspects

In the Electro-Therapeutical Department students obtain instruction in the Treatment of Lupus and Cancer by the X Ray method of treatment An Electrocardiograph Department has recently been established

The Hospital and Medical School are fully equipped for the theoretical and practical teaching of all the subjects of the medical curriculum and for the Diploma in Public Health Ample laboratory and class room accommodation is provided

The Bland Sutton Institute of Pathology contains a new lecture theatre and large pathological bacteriological and clinical laboratories where every facility is given for original research The Anatomical and Pathological Museum is now part of the Institute Special classes are held to prepare students for the Intermediate examinations of the Universities and for the Primary and Final examinations for the F.R.C.S. (England) Diploma There is a Dental College in the hospital for students

Special Appointments.—All appointments are made with or fee of any kind and the following are appointed at intervals annually six house physicians each house surgeon two obstetric and gynaecological house surgeons two casualty medical officers two casualty surgical officers

and two resident officers to the special departments. The medical and surgical casualty officers are appointed twice a year. The medical, surgical, and obstetric and gynaecological registrars are appointed as vacancies arise.

Non resident qualified clinical assistants are appointed to assist in the various out-patient departments. Clinical clerks and surgical dressers are also appointed in every department.

Scholarships Prizes, &c.—(a), (b), and (c) Three Entrance Scholarships, value £100, £50, and £25, and (d) a University Scholarship, value £50 are awarded annually in September. The successful candidates are required to become general students of the school. (e) A Freer Lucas Scholarship for Students of Epsom College is awarded annually on the nomination of the Headmaster. There are also, (f) and (g), two Broderip Scholarships, value £60 and £40 respectively, (h) the Lyell Gold Medal and Scholarship, value £55 5s., (i) the John Murray Medal and Scholarship, value £25 (awarded every third year), (k) the Freeman Scholarship, value £30, (l) the Hetley Clinical Prize value £25, (m) the Leopold Hudson Prize, value 11 guineas, and (n) the Second Year's Exhibition value 10 guineas. There are also numerous class prize examinations.²

In connexion with the Cancer Investigation Department the following Scholarships are awarded—Richard Hollins Research Scholarship, value £105, Salters' Company Cancer Research Scholarship, value £100, and a Cancer Research Scholarship, value £60.

Fees.—The Composition Fee for the curriculum for the diplomas of the Conjoint Board or Society of Apothecaries is 135 guineas, for the curriculum for the degrees of the University of London 145 guineas, for students who have passed the First Examination for Medical Degrees (University of London) 120 guineas, and for those who have completed their Anatomical and Physiological studies, 70 guineas. The fee for Dental students is 54 guineas. The fees may be paid by instalments.

The Amalgamated Students' Club includes the following: the Medical Society, the Common Room Society, the cricket club, the football clubs, the athletic club, the rowing club, the musical society, the chess club, the lawn tennis club, and the hockey club. The athletic ground, which is eight acres in extent, is situated within easy access of the hospital—at Park Royal. There is a gymnasium within the precincts of the hospital. A subscription to the Amalgamated Students Club is payable by all General and Dental students.

Medical and Surgical Staff.—Consulting Physicians: Dr Cayley, Dr Sidney Coupland, Sir Richard Douglas Powell, Bart., and Sir James Kingston Fowler, K.C.V.O. Consulting Surgeon: Sir Henry Morris, Bart. Consulting Obstetric Physician: Dr W. Duncan. Consulting Physician to the Skin Department: Dr Liveing. Consulting Ophthalmic Surgeon: Mr Lang. Consulting Surgeon to the Ear and Throat Department: Mr Stephen Paget. Consulting Dental Surgeons: Mr W. Hern and Mr W. S. Nowell.

Physicians: Dr Pasteur Dr Wynter, Dr Voelcker and Dr Wethered. Surgeons: Sir Alfred Pearce Gould, K.C.V.O., Sir John Bland Sutton, Mr Murray, and Mr Kellock. Physician and Assistant Physician to the Department for Skin Diseases: Dr Pringle and Dr MacCormac. Physician to the Department for Nervous Diseases: Dr Campbell Thomson (Dean of the Medical School). Obstetric and Gynaecological Surgeon and Assistant Obstetric and Gynaecological Surgeon: Mr Berkeley and Mr Bonney. Physician to Out-patients: Dr Young. Surgeons to Out-patients: Mr Handley and Mr Taylor. Assistant Physicians: Dr Lakin, Dr MacCormac and Dr Cockayne. Assistant Surgeon: Mr Webb-Johnson. Ophthalmic Surgeon and Assistant Ophthalmic Surgeon: Mr Lawson and Mr Greeves. Surgeon to the Ear, Nose, and Throat Department: Mr Somerville Hastings. Dental Surgeon and Assistant Dental Surgeon: Mr Turner and Mr James. Anaesthetists: Mr T. G. A. Burns, Mr H. Charles and Mr R. E. Apperly. Assistant Anaesthetist (Resident): Mr Warwick. Registrars: Dr G. E. Beaumont, Mr Rivett, Mr Oliver, and Dr Morson. Resident Medical Officer: Dr D. R. C. Shepherd.

The staff deliver the lectures and demonstrations in their respective subjects. Other lecturers are: Psychiatry: Dr James Chambers. Bacteriology: under the supervision of the director of the Bland Sutton Institute of Pathology.

Dr C. H. Browning. Anatomy and Embryology. Dr Yeates. Physiology and Biology. Dr Strickland Goodall. Chemistry and Physics. Dr A. M. Kellas.

ST THOMAS'S HOSPITAL.—This hospital received its present charter from King Edward VI., but as a monastic institution was in existence prior to the year 1207. The building occupies a unique position by the river, opposite the Houses of Parliament and contains 983 beds, including 530 for military patients. The in-patients last year numbered 9995 whilst the number of attendances as out-patients including the casualty and light departments, was 246,652. There are special departments for the treatment of women, children, the eye, ear, nose and throat, skin, and teeth. Departments for light treatment, X-rays, and physical exercises are also special features. A speech clinic has recently been inaugurated in connexion with the Children's Department. Exceptional facilities are offered in the hospital laboratories for the study of general pathology, clinical pathology, chemical pathology, cardiology and of treatment by serums and vaccines. Surgical operations take place in the main theatres every day except Saturdays at 2 P.M. Clinical teaching in the wards, out-patients and special departments, is available every day of the week. Clinical lectures are delivered every Wednesday during the sessions. All appointments in the hospital are open to students without extra fee. Clinical assistants to all the special departments are appointed every three months. A resident assistant physician and a resident assistant surgeon at a salary of £150 each are appointed biennially, also four hospital registrars (medical, surgical, obstetric and ophthalmic) the two former receive a salary of £150 and the two latter £50. An assistant in the clinical laboratory and an assistant pathologist are paid at the rate of £200 per annum. Appointments open to students before qualification. Clinical clerks and dressers for in and out-patients are selected from students who have completed the third year's work. Every student acts as clerk in the post-mortem room and in one of the pathological laboratories takes his turn on maternity duty under proper supervision in the maternity ward, thus obviating any necessity for seeking instruction elsewhere. Students are instructed in the administration of anaesthetics by one of the hospital anaesthetists. The Students' Club comprises a spacious restaurant and smoking and reading room. There is an occasion for students to leave the hospital buildings during working hours. The curriculum is arranged to meet the requirements of all the Examining Bodies. Special classes are held for the examinations at the University of London and for the First and Final Fellowship Examinations of the Royal College of Surgeons of England. Tutorial classes in all subjects precede the various examinations. The hospital is easily accessible from all parts.

Fees.—The annual composition fee is 30 guineas, covering all tutorial classes—in addition to a fee on entrance. Qualified practitioners are permitted to attend the hospital practice on terms which may be ascertained from the secretary.

Staff.—Consulting Physicians: Dr Harley, Sir Seymour J. Sharkey and Dr Acland. Consulting Obstetrical Physician: Dr Gervis. Consulting Ophthalmic Surgeon: Mr Liebreich. Consulting Anaesthetist: Mr W. Tyrrell. Consulting Dentist: Mr C. E. Truman. Physicians: Dr Hawkins, Dr Mackenzie, Dr Turney, Dr Perkins and Dr Box. Surgeons: Sir G. H. Makins, Mr Battle, Mr Ballance, Mr Robinson, Mr Cathbert Wallace, Mr F. M. Corne and Mr Percy Sargent. Physicians to Out-patients: Dr Russell, Dr Buzzard, and Dr Cassidy. Surgeons to Out-patients: Mr C. A. R. Nitch and Mr J. F. Adams. Obstetric Physicians: Dr Fairbairn and Dr Hedley. Ophthalmic Surgeons: Mr Fisher and Mr Hudson. Physician for Diseases of Children: Dr Box. Surgeon for Diseases of Children: Mr J. E. Adams. Mental Diseases: Dr R. Percy Smith. Surgeon for Diseases of the Throat: Mr W. G. Horwath. Physician for Diseases of the Skin: Dr E. Stainer. Surgeon for Diseases of the Ear: Mr Marriage. Dental Surgeon: Mr P. McKay. Resident Assistant Physician: Dr G. Hoffmann. Resident Assistant Surgeon: Mr S. H. Rouquet. Anaesthetists: Dr H. Low, Dr Mennell, Dr Hedley and Dr D. C. Pharmaceutics: Mr J. A. Jennings. Curator of Museum:

² Certain of these scholarships have been modified for the period of the war.

Professor S G Shattock, Director of Laboratories
Mr L S Dudgeon, Chemical Pathologist
Dr Hugh Maclean, Superintendent of X Ray Department
Mr A D Reid, Physico-therapeutic Department
Mr R Timberg, Dr J B Mennell and **Mr W R Bristow**, Tuberculosis Department
Dr R C Wingfield, Cardiograph Department
Dr M A Cassidy

The staff deliver the lectures in their respective subjects, assisted by the following lecturers and demonstrators—
Anatomy Professor F G Parsons
Chemistry Dr Le Sueur
Physiology Dr J Mellanby
Biology Dr O Donoghue and **Mr W Rushton**
Physics Mr Brinkworth
Midwifery and Diseases of Women Dr Fairbairn
Pharmacology and Therapeutics Dr Woolley
Forensic Medicine and Toxicology Dr E Smith and **Dr J C Withers**
Mental Diseases Dr W H B Stoddart
Public Health Dr H P Newsholme
Tropical Medicine Professor Sandwith
Instruction in Vaccination by Dr Cope.

Dean of the School Dr E Stainer
Sub Dean Dr O R Box
Secretary Mr G Q Roberts from whom any further information may be obtained.

Scholarships and Prizes—At this school there are five Entrance Scholarships—namely two in Arts equivalent to the tuition fees for the first medical examination, two in Natural Science, of the value of £150 and £60 respectively to be taken out in tuition fees, and the University Scholarship of £50 in Anatomy Physiology and Chemistry. The money value and subjects of examination of the remainder are as follows: (a) and (b) two College Prizes one for second year students and one for third year students £10 and £5 respectively, (c) William Tite Scholarship for second year students £25, (d) and (e) Musgrove Scholarship or (alternately) Percock Scholarship, each for third year students and tenable for two years, £35 each, (f) three College Prizes for fifth year students of £10 each and three of £5 each, (g) Cheselden Medal Surgery and Anatomy, (h) Mead Medal Medicine Pathology, and Hygiene, (i) Toller Prize Medicine Pathology and Hygiene, (j) Bristowe Medal Pathology and Morbid Anatomy, (k) Solly Medal and Prize biennially, Surgical Reports, (l) Treasurer's Gold Medal for the most distinguished fifth year student, (m) Wainwright Prize, Medicine Pathology, and Hygiene, (n) Hadden Prize Pathology, (o) Beane Scholarship £50 biennially Surgery and Surgical Pathology, (p) Sutton Sams Prize biennially reports of cases in Obstetric Medicine, (q) Grainger Testimonial Prize, £31 10s Anatomy and Physiology, (r) Salters Company Research Fellowship tenable for three years £100 annually Pharmacology, (s) Louis Jenner Research Scholarship tenable for two years £60 annually Pathology, and (t) Research Scholarship tenable for two years £200 per annum.

UNIVERSITY OF LONDON UNIVERSITY COLLEGE.—University College has been constituted a University centre for the teaching of medical sciences. The College Faculty of Medical Sciences comprises the Departments of Physics Chemistry Botany and Zoology (the Preliminary Medical Sciences) also the Departments of Anatomy Physiology and Pharmacology (the Intermediate Medical Sciences) and the Departments of Hygiene and Public Health and of Pathological Chemistry (Post graduate Study).

Faculty of Medical Sciences—Compensation fees—For the courses required by the University of London: 1 For the First Medical Course 26 guineas entitling to one attendance and to the privileges of the Union Society for one session. 2 For the Second Medical (Intermediate) Course 53 guineas if paid in one sum 60 guineas if paid in two instalments of 30 guineas each. This fee entitles to attendance at Anatomy and Physiology during three years and to one attendance at Organic and Applied Chemistry Pharmacology and Materia Medica, and to the privileges of the Union Society for two sessions.

For the medical education required by the Examining Board in England and the Society of Apothecaries: First examination I, II, III 21 guineas entitling to one attendance and to the privileges of the Union Society for one session. First Examination Part IV and second examination 33 guineas if paid in one sum and 60 guineas if paid in two instalments of 30 guineas each. This fee entitles to attendance during three years and to the privileges of the Union Society for two sessions.

Professors and Lecturers—1. **First Medical Course**.—**Chemistry**—Professors J N Collie F.R.S. and F G Donnan, F.R.S., assistant professor Samuel Smiles D.Sc., teachers of chemistry to medical students R H Plimmer D.Sc., and W B Tuck, D.Sc., assistants Irvine Masson, M.Sc., R E Slade D.Sc., and H Terrey B.Sc., demonstrator W W Reeve B.Sc. **Physics**—Professor W H Bragg, F.R.S., reader in thermo-dynamics A W Porter F.R.S., assistants N Eumorfopoulos, B.Sc. A O Rankine, D.Sc. and D O Wood, M.Sc. **Botany**—Professor F W Oliver, F.R.S., reader in plant physiology T G Hill A.R.C.S., assistant E M Cutting M.A. **Zoology**—Professor J P Hill F.R.S., assistants C H O Donoghue, D.Sc., and F J Bridgman, A.R.C.S. 2. **Second Medical (Intermediate) Course**.—**Anatomy**—Professor G D Thane, F.R.C.S., demonstrator and lecturer in surgical anatomy H T Mant, F.R.C.S., demonstrator, lecturer in physical anthropology, and curator of the museum D E Derr M.B., demonstrator and lecturer in anatomy T B Johnston M.B., assistant demonstrators G V Anderson and R B Green Jodrell Professor of Physiology E H Starling F.R.S. Professor of General Physiology W M Bayliss, F.R.S. Readers G A Buckmaster, M.D. and R H Plimmer, D.Sc. Assistant and Sharpey Scholar C Lovatt Evans, D.Sc. **Pharmacology**—Professor A R. Cushey F.R.S. Assistant J W C Gunn, M.B.

Scholarships and Prizes—The first three items on the present list require a complete intermediate course at University College. The money value and subjects at examinations are as follows: (a) The Bucknill Scholarship 135 guineas, (b) and (c) two Entrance Exhibitions 55 guineas each, Chemistry, Physics Botany and Zoology, (d) Cluff Memorial Prize £15 biennially Anatomy, Physiology, and Chemistry, (e) Schäfer Prize in Physiology, £18 triennially, (f) Sharpey Physiological Scholarship £105, Biological Sciences, (g) Morris Bursary for sons of deceased professional men by nomination tenable for two years £16 a year, and (h) five Gold and five Silver Medals awarded annually in various departments.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL.—Dean J Herbert Parsons, F.R.C.S. Vice-Dean H Morrison Davies F.R.C.S. Secretary L R Thomas Fees for Preliminary and Intermediate Course See under University College. For the Final M.B., B.S. (London) Course 80 guineas if paid in one sum, 82 guineas if paid in two instalments as follows—first year 50 guineas, second year, 32 guineas. This fee entitles to attendance on Lectures and Hospital Practice during three years and to one attendance on Practical Pathology and Practical Surgery. Vaccination and attendance at a Fever Hospital are not included. Students who obtain a medical qualification within three years of the time of commencing this course are not required to pay an additional fee for further attendance. This course of instruction is also suitable for the corresponding examinations at the Universities of Oxford Cambridge and Durham and for the medical education required by the Examining Board in England and the Society of Apothecaries.

There are over 300 beds in the hospital.

Special Departments Clinical and Laboratory Facilities—Those who are desirous of carrying out original research in Pathology including Morbid Anatomy Bacteriology Experimental Pathology and Chemical Pathology are admitted to work in the laboratories of the school by the Director of Pathological Studies and Research and under certain conditions can receive grants from the Charles Graham Medical Research Fund. A special course of instruction is given for preparation for the examinations for Diplomas in Public Health of the various universities and examining bodies, also special courses of Lectures and Demonstrations in Anæsthetics Diseases of the Eye, Ear, Nose and Throat Skin and Diseases of the Teeth in Electrical and Radioscopic Diagnosis and Treatment in Clinical and Tropical Pathology and in Cardiac Pathology. These courses are designed for senior students and graduates.

Apprenticeship for Students—Clerkships and dresser ships to the physicians surgeons anaesthetist, and pathologist are allotted amongst the students of the hospital. Maternity students are appointed each month and reside in the Students' House connected with the Medical School and Hospital. Eight house physicians and house surgeons four senior and four junior obstetric assistants are selected.

annually by examination from among the senior students who have a medical qualification. The house physicians and house surgeons reside free in the hospital for six months, and the senior obstetric assistants for three months. In addition to these posts there are certain special appointments which are vacant from time to time and are filled by senior students of the hospital. 1 The Resident Medical Officer. This officer is appointed for a period of two years and is chosen from amongst the more senior recent residents of the hospital. 2 The two Surgical Registrars are also chosen from among the more senior recent residents of the hospital. 3 The Obstetric Registrar. 4 Two Casualty Medical Officers and a Casualty Surgical Officer are appointed, each for a period of six months. 5 Assistant in Ear and Throat Department, appointed for one year. 6 Assistant in Ophthalmic Department, appointed for one year. 7 Registrar in Anaesthetic Department, appointed for one year. 8 Deputy Anaesthetists. During the absence of one or another of the Anaesthetists in the summer months a senior qualified student is appointed as a substitute and is granted a special certificate.

Museum of Pathological Anatomy—The Museum, a spacious and well lighted room, is open for study from 9 A.M. to 5 P.M. Microscopic sections of most of the specimens in the Museum have been prepared and are available for the use of students on application to the Curator. The Museum contains 1100 admirable paintings by Sir Robert Carswell and Sir Charles Bell and a collection of old surgical instruments formerly belonging to Robert Liston.

The Anatomical Museum of the University of London, University College, is open to all students of University College Hospital and Medical School on the recommendation of the School Committee.

The Medical Library is open daily for the purposes of study to every student of the Medical School from 9 A.M. to 5 P.M., Saturdays 9 A.M. to 1 P.M. It contains about 13,500 works on medical subjects including all the current text-books and works of reference required for study or research.

The Medical Society of University College Hospital Medical School exists for the dual purpose (1) of promoting the study of Medical and Surgical Science, and (2) of promoting social intercourse among its members. All Students of the Medical School are eligible for membership. Meetings are held once a fortnight for the purpose of discussing subjects connected with the study of medicine. In its social aspect the society includes various athletic clubs and superintends the gymnasium and squash racquet court in the Medical School. The Athletic Ground, which is used in conjunction with the Union Society of the University of London University College, is situated near the Great Western Railway station at Perivale.

Residence of Students—A register of boarding residences is kept in the office of the Medical School for the convenience of students, these residences are not under the control of the school authorities. University College Hall, Ealing, is recognised by the Medical School authorities as a residential hostel. The Students House in University street contains large and comfortable rooms. The Maternity Students occupy them on payment of a moderate charge. Gentlemen who desire assistance in their studies should consult the Dean or Lecturers.

Hospital Staff—Consulting Physicians: Sir John Williams, Dr F. T. Roberts and Sir Thomas Barlow. Physicians: Sir John Rose Bradford, Dr Sidney Martin, Dr H. Batty Shaw, Dr F. J. Porvinton and Dr C. Bolton. Assistant Physicians: Dr T. R. Elliott and Dr T. Lewis. Obstetric Physicians: Dr H. R. Spencer and Dr G. F. Blacker. Physician in charge of Skin Department: Dr A. M. H. Gray. Physician in charge of Mental Diseases Department: Dr B. Hart. Consulting Surgeons: Sir John Tweedy (Ophthalmic), Sir Rickman Godlee and Mr B. Pollard. Surgeons: Mr R. Johnson, Mr W. Trotter and Mr H. M. Davies. Assistant Surgeon: Mr G. E. O. Williams. Ophthalmic Surgeons: Mr P. Flemming and Mr J. H. Parsons. Professor and Lecturer on Public Health: Dr H. R. Kenwood. Dental Surgeons: Mr P. S. Spokes and Mr H. J. Shirley. Anaesthetists: Dr D. W. Buxton and Dr H. J. Shirley. Assistant Anaesthetist: Dr A. B. Kingsford. Surgical Registrars: Mr E. K. Martin and Dr C. E. Shattock. Resident Medical Officer: Dr H. L. Tasker. Pathologist:

Mr T. W. P. Lawrence. Bacteriologist: Dr F. H. Teale. Assistant Physician in Charge of Cardiographic Department: Dr T. Lewis. Officer in Charge of Electro-Radiograph Department: Mr R. H. Cooper. Pharmacist: Mr C. H. Hampshire. The staff deliver the lectures and demonstrations in their subjects.

Other lecturers and demonstrators are: Surgical Anatomy: Mr H. T. Mant. Diseases of Childhood: Mr H. Tiller. General Pathology: Dr A. E. Boycott. Practical Pathology: Mr D. Embleton. Mr S. H. Warren and Mr E. Bach. Diseases of the Ear and Throat: Mr H. Tiller and Mr G. S. Hett. In the Dental Department in Great Portland street, formerly known as the National Dental Hospital, there is afforded the opportunity for attending lectures and practical instruction in diseases of the mouth and teeth.

Scholarships and Prizes—At this School the first two Scholarships (a) and (b) require a complete course at University College and University College Hospital Medical School, the second two (c) and (d) require a final course at the Medical School. The money value and subjects of examination are as follows:—(a) Entrance Scholarship, Bucknill 135 guineas, Chemistry, Physics, Botany and Zoology, (b) Epsom Free Medical Scholarship, subjects of Preliminary Scientific Examination and Nomination by Epsom College, (c) and (d) two Goldsmid Entrance Exhibitions, 80 guineas each. Anatomy and Physiology, (e) Graham Scholarship in Pathology, £200 per annum for two years awarded by the Senate of the University of London, (f) Atkinson Morley Scholarship, tenable for three years, £45 per annum, Surgery, (g) Atchison Scholarship, tenable for two years, £55 per annum, General Proficiency in Medical Studies, (h) Magrath Clinical Scholarship, about £100, Clinical Cases, (i) Percival Allyn Scholarship, about £60, Surgery, (j) Filliter Exhibition, £30, Pathology, (k) Erichsen Prize, £10 10s. Practical Surgery, (l) two Senior and two Junior Fellowships. Clinical Medals for Clinical Medicine, (m) two Liston Gold Medals for Clinical Surgery, (n) Alexander Bruce Gold Medal for Pathology and Surgery, and (o) Tuke Silver and Bronze Medals for Pathology.

WESTMINSTER HOSPITAL—The hospital contains 215 beds and affords relief to upwards of 2000 in patients and 30,000 out-patients annually. There are separate departments for Diseases of the Eye, Ear, Skin, Teeth and Throat for Orthopaedic practice, for Diseases of Women for Diseases of Children for Radiography and for the Light Treatment. The Anatomical, Pathological and Materia Medica Museums are open to all students of the school.

A medical and surgical registrar, each with a salary of £50, are appointed annually. Two house physicians, three house surgeons and a resident obstetric assistant are appointed for six months after examination, and are provided with rooms and commons, also one assistant house physician and one assistant house surgeon with commons only. Clinical assistants to the assistant physicians and assistant surgeons and to the officers in charge of special departments are appointed from among qualified students of the hospital.

By a scheme for the concentration of the teaching of the preliminary and intermediate subjects of the curriculum which has the support of the London University an arrangement has been made by the Westminster School for the teaching of these subjects at King's College. Students however join the Westminster Medical School as formerly and may compete for Entrance Scholarships heretofore.

There is laboratory accommodation for practical work in Chemistry, Physics, Biology, Anatomy, Physiology, Histology, Pathology and Bacteriology and a new Clinical Laboratory has recently been erected. Facilities for research are afforded in all the laboratories.

For membership of the Clubs Union students are required to pay the expense being covered by the entrance fee to the school.

Staff—Consulting Medical Staff: Sir Bryan Donkin, Dr de Havilland Hall and Dr Hebb (lecturer in general pathology with Dr Braxton Hicks). Consulting Surgical Staff: Mr Richard Davey, Mr G. Cooper and Mr N. C. Macnamara. Medical In-patient Staff: Dr A. M. Gossage, Dr Purves Stewart and Dr C. W. C.

(b) Darnall Medical Exhibition £60 a year.

LONDON (POSTAL FREE HOSPITAL) SCHOOL OF MEDICINE
 11, WILKINSON STREET, BRANSTON, W.C.—
 The fee for the medical course for the degree of the
 University of London and for the diplomas of the Royal
 College of Physicians and for other qualifications is £160
 for the first year and £175 for the second year. These sums
 include board and lodging fees.
 The Hospital Free School of Medicine is a body of 1,728
 students of the University of London, 13 of whom are medical

tenable for three or five years (c) Bostock Scholarship, tenable for two or four years, and next to be awarded in June, 1919, £60 (d) Mabel Sharman Crawford Scholarship, tenable for four years, £20 a year (e) Mabel Webb Research Scholarship, tenable for one year and renewable, £30, Physiology, Chemistry, or Pathology (f) Fanny Butler Scholarship, tenable for four years, next award in September, 1918, £14 10s (g) John Byron Bursary, tenable from two to four years for students already in the School requiring assistance for the prosecution of their medical studies, application to the Secretary by March 31st, next award in March, 1917, £20 (h) Ellen Walker Bursary tenable for two years, awarded to a student beginning fourth year of medical study, £25 a year (j) Helen Prideaux Scholarship, awarded every second year to a student who has become qualified during the two years immediately preceding the award, and to be spent in assisting the holder to further study, £40 (k) Agnes Guthrie Bursary, value £60, is offered annually to students who desire to pursue a full course of study for the Licentiate'ship in Dental Surgery (l) Dr Edith Pechey Phipson Post-graduate Scholarship of the value of £40, awarded annually in June It is open to all medical women, preferably coming from India, or going to work in India, for assistance in Post-graduate study (m) Sarah Holborn Scholarship, value £20 a year for three or five years, awarded every alternate year, next award in 1917 Two Richardson Kuhlmann Prizes are given each year, value £12 for proficiency in Clinical Obstetrics, value £8, for proficiency in senior subjects respectively Three Evans Prizes of £3 3s, £2 2s, and £1 1s are given in alternate years on the results of the class examination in Midwifery The Evans Prize for Operative Midwifery, value £5 5s, is awarded yearly The Edith Pechey Phipson Prize in Pharmacology, value £3 3s, is awarded annually There is also a small fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help Prizes and Certificates of Honour are awarded in each class at the end of the session

UNIVERSITY OF DURHAM

Two Diplomas, one Licence, and six degrees are conferred—viz., the Diploma in Public Health, Diploma in Psychiatry, the Licence in Dental Surgery, and the degrees of Bachelor of Medicine, Bachelor of Surgery, Master of Surgery, Doctor of Medicine, Bachelor of Hygiene, and Doctor of Hygiene

For the degree of *Bachelor of Medicine* there are four professional examinations The subjects of the First Examination are—Elementary Anatomy Elementary Biology, Chemistry and Physics The subjects of the Second Examination are—Anatomy and Physiology The subjects for the Third Examination are—Materia Medica and Pharmacy, Pathology Medical Jurisprudence, Public Health, and Pathology and Elementary Bacteriology The subjects of the Fourth Examination are—Medicine, Clinical Medicine and Psychological Medicine, Surgery and Clinical Surgery Midwifery and Gynecology, Therapeutics, and Diseases of the Skin of the Throat, Nose, and Ear, and of Children

It is required that at least one of the five years of professional education shall be spent in attendance at the University College of Medicine Newcastle upon Tyne Candidates who have passed the First and Second Examinations of the University will be exempt from First and Second Examinations of the Conjoint Board

For the degree of *Bachelor of Surgery* every candidate must have passed the examination for the degree of Bachelor of Medicine of the University of Durham and must have attended one course of lectures on Operative Surgery and one course on Applied Anatomy Candidates will be required to perform operations on the dead body and to give proof of practical knowledge of the use of surgical instruments and appliances

For the degrees of *Doctor of Medicine* and *Master of Surgery* a candidate must not be less than 24 years of age and must satisfy the University as to knowledge of Greek or German If he has not already satisfied the Matriculation Examiners in either Greek or German he must pass in one of these subjects at one of the ordinary matriculation examinations of the Newcastle division of the University He must also have obtained the degree of Bachelor of Surgery of the University of Durham

and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Surgery, in attendance on the practice of a recognized hospital, or in the naval or military services, or in medical or surgical practice The candidate for the M D degree must present an essay The subjects of examination for the M S are—Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations Clinical Surgery

Doctor of Medicine (without residence)—The University of Durham has instituted a special examination whereby the degree of Doctor of Medicine may be obtained without residence Candidates shall not be under 40 years of age and shall have been in active practice for 15 years as registered medical practitioners They shall produce certificates of moral character from three registered members of the medical profession The fee will be 50 guineas, of which 20 guineas will be retained if the candidate fails to satisfy the examiners

Candidates for any of the above degrees, diplomas or licence, must give at least 28 days' notice to Professor Howden, Secretary, College of Medicine, Newcastle-upon-Tyne In the case of the M D (essay) examination candidates must send in their essays six weeks before the date of the examination

Professors—Principles and Practice of Medicine Sir G H Philipson, M D, Dr David Drummond and Sir T Oliver, M D Psychological Medicine Dr T W McDowall Surgery Mr James Rutherford Morison Mr Henry Branton Angus, and Mr G Grey Turner Ophthalmology Mr John Dobson Wardale Midwifery and Diseases of Women and Children Professor R P Ranken Lyle Pathology Professor Stuart McDonald Medical Jurisprudence Professor Robert A Bolam Public Health Professor Thomas Eustace Hill Therapeutics Professor Thomas Beattie Anatomy Professor Robert Howden, demonstrators, Dr James Dunlop Lichley and Dr E P Stibbe Applied Anatomy Mr John Clay Physiology Professor James Acworth Menzies Materia Medica and Pharmacology Dr W E Hume Comparative Pathology and Bacteriology Professor H J Hutchens, lecturer, Mr Percy Charles W Laws, demonstrator (vacant), assistant demonstrator Dr George Hall

Scholarships and Prizes—In connexion with this University the following Scholarships and prizes are awarded—(a) (b), (c), and (d) Four Scholarships of £25 a year each, tenable for four years, the examination will be the September Matriculation Examination Candidates must take English Latin Arithmetic Euclid, Algebra Geography English History, with Greek or German, or both (See College Calendar for special books) Open to candidates desirous of being admitted as Medical Students The successful candidates must take out their entire curriculum at the University of Durham College of Medicine Newcastle upon Tyne (e) Pears Scholarship of £50 a year (when vacant) tenable for three years, Matriculation Examination—At the College of Medicine are (f) Dickinson Scholarship, interest on £400 and gold medal, examination in Medicine, Surgery Midwifery, and Pathology Open to full students of the College of Medicine who have passed the third M B Examination (g) Tulloch Scholarship interest on £400, examination in Elementary Anatomy Biology Chemistry, and Physics (h) Charlton Memorial Scholarship, interest on £700, examination in Medicine Open to full students of the College entered for the class on the Principles and Practice of Medicine (i) Gibb Scholarship interest on £500, awarded annually as a Scholarship in Pathology to full student who passes the best examination in that subject No student is eligible after completion of his curriculum (j) Lake Armstrong Memorial Scholarship interest on £680 Original Essay on some subject in Comparative Pathology (If no essay of sufficient merit be presented the scholarship may be awarded to the candidate who, in passing the first part of the Examination for the B Hy Degree, obtains the highest number of marks in Comparative Pathology during the year) Open to all Graduates in Medicine or Hygiene and candidates for these degrees who have spent six months at the University and whose age does not exceed 30 years (k) Stephen Scholarship interest on £1000, Original Essay on any Surgical subject Open to any graduate in Medicine or Surgery of the University or any student of the College

of Medicine Student's age must not exceed 30 years
(l) Heath Scholarship, interest on £4000 For 1916
Original Essay on Genito-urinary Tuberculosis Its Etiology,
Pathology, Methods of Spread Prognosis, and Treatment
All Graduates in Medicine or Surgery of the University are
eligible (m) Gibson Prize, interest on £250 stock, examina-
tion in subject of Midwifery and Diseases of Women and
Children Open to students who have attended one
course of lectures on Midwifery and Gynaecology
(n) Outterson Wood Prize, interest on £250, in Psycho-
logical Medicine (o) Turnbull Prize and Medal, exa-
mination in Surface Anatomy Open to students at
end of their second winter session—At the Royal Infirmary
is (p) Goyder Memorial Scholarship, interest on £325,
awarded annually to student who most distinguishes
himself in Clinical Medicine and Clinical Surgery at the
Royal Infirmary For further information apply to Pro-
fessor Howden, Secretary of the College

Hygiene—The regulations with regard to the degrees in
Sanitary Science will be found under the section on Public
Health

THE COLLEGE OF MEDICINE, Newcastle-upon Tyne—
Clinical instruction is given at the Royal Victoria Infirmary,
containing 575 beds In it adequate accommodation is
provided for the study of the various special subjects, in
addition to the ordinary clinical work

NEWCASTLE-UPON TYNE ROYAL VICTORIA INFIRMARY—
The Infirmary was founded in 1751, but has been entirely
rebuilt, the new hospital being opened by His late Majesty
King Edward VII in 1906 The number of beds is 575 The
number of in-patients annually is 9200 and of out-patients
69,000 The medical students of the University of Durham
attend the practice of this hospital Clinical Lectures are
delivered by the Physicians and Surgeons weekly and ward
demonstrations are given daily Tutorial classes are held
by the Assistant Physicians, Assistant Surgeons, and
Surgical Registrars weekly, and demonstrations are given in
the several out-patient departments daily Pathological
demonstrations are given by the Pathologist daily or as
opportunity occurs, and in the new buildings nothing has
been spared in perfecting scientific equipment In addition
to medical and surgical in-patient and out-patient depart-
ments the following special departments are fully equipped
for teaching students Ophthalmic Throat, Nose, and
Ear Skin Gynaecological, and Electrical The hospital
building contains the following laboratories 1 Special
Pathological Laboratory attached to the post-mortem
rooms 2 Bacteriological Laboratory, in which all
clinical bacteriological investigations are carried out—
opsonic indices estimated with a view to treatment by
vaccines and serums, &c 3 There is in addition a
Clinical Laboratory attached to each ward and to the out-
patient department There are five operating theatres in
use in the hospital The surgical practice is especially
good The session opens on April 17th and Oct 2nd of
each year Applications for detailed information should be
made to the Acting Dean, Dr D Wells Patterson, at the
hospital

Staff—Physicians Dr T Beattie, Dr W E Hume
Dr Horsley Drummond and Dr Alfred Parkin Assistant
Physicians Dr George Hall Dr T M Allison, Dr D W
Patterson, and Dr T O Hunter Surgeons Mr
A M Martin, Mr H B Angus, Mr J V W Rutherford,

gate road, Newcastle on Tyne Out-patients, 11,526, in-
patients, 358

UNIVERSITY OF BIRMINGHAM

The University of Birmingham grants the degrees of M B,
Ch B, M D, Ch M, and also a degree and a diploma in
Public Health The course for the Bachelors' degrees ex-
tends over five years from the date of commencement of
professional study As a rule the first four of these
years must be spent in the University, but the Senate has
power of recognising attendance at another University as
part of the attendance qualifying for these degrees and of
recognising examinations passed at such other Universities as
exempting from the examinations in Chemistry Physics, and
Elementary Biology In the case of such students at
least three years must be spent in attendance upon classes
at the University The fifth year may be spent at any
other school or schools of medicine recognised by the
University The students of the Medical Faculty can be
members of the University Club the University Athletic
Club, and the University Officers' Training Corps, while they
possess a guild—the Guild of Undergraduates—which is
designed to be a recognised medium of communication
between the teachers and the taught The University
Medical Society and the Dental Students' Society also offer
opportunities of co-operation for mutual benefit

Degrees of Bachelor of Medicine and Bachelor of Surgery—
The student must have passed either the Matriculation
Examination of the University or one of the following
examinations For the present the University will recognise
any one of the following examinations, in lieu of its own
Matriculation, in the case of medical students, provided
always that such examination shall have included the sub-
jects of Chemistry or Experimental Mechanics or some other
branch of Experimental Physics, English, Mathematics, a
foreign Language, and either another language or an addi-
tional science, and that all the subjects have been passed at
one examination (a) the previous examination of the
University of Cambridge, (b) Responsions of the University
of Oxford, (c) the Preliminary or Matriculation Examina-
tion of a recognised University, (d) the (Higher) Certi-
ficate of the Oxford and Cambridge Examinations Board,
(e) the Oxford or Cambridge Senior Local Examina-
tion, (f) the Senior Certificate of the Central Welsh
Board A Matriculation Examination will commence on
Sept 13th 1916 First Examination—Chemistry and
Physics and Elementary Biology Second Examination—
Anatomy and Physiology Third Examination—General
Pathology and Bacteriology Materia Medica, and Practical
Pharmacy Fourth Examination (at the end of the
fourth year)—Forensic Medicine Toxicology, Public
Health, Therapeutics and Special Pathology Two years'
hospital work must have been accomplished Final
Examination.—Medicine, Surgery, Midwifery, Diseases
of Women, Mental Diseases, and Ophthalmology Atten-
dance at a general hospital for a year after the passing
of the fourth examination will be required, also atten-
dance at a fever hospital three months maternity hospital
one month, and lunatic asylum three months Vaccination
instruction must be taken out and courses of Ophthalmology
Medical and Surgical Anatomy and Operative Surgery

Degrees of Doctor of Medicine and Master of Surgery—
At the end of one year from the date of having passed
the final M B, Ch B examination the candidate will be
eligible to present himself for the higher degrees of either
Doctor of Medicine or Master of Surgery or both

Candidates for either of these degrees have to present a
thesis embodying observations in some subject embraced in
one of the departments of the medical curriculum and in
addition pass a general examination in Principles and

tenable for three or five years (c) Bostock Scholarship, tenable for two or four years, and next to be awarded in June, 1919, £60 (d) Mabel Sharman Crawford Scholarship, tenable for four years, £20 a year (e) Mabel Webb Research Scholarship, tenable for one year and renewable, £30, Physiology, Chemistry, or Pathology (f) Fanny Butler Scholarship, tenable for four years, next award in September, 1918, £14 10s (g) John Byron Bursary, tenable from two to four years, for students already in the School requiring assistance for the prosecution of their medical studies, application to the Secretary by March 31st, next award in March, 1917, £20 (h) Ellen Walker Bursary tenable for two years, awarded to a student beginning fourth year of medical study, £25 a year (j) Helen Prideaux Scholarship, awarded every second year to a student who has become qualified during the two years immediately preceding the award, and to be spent in assisting the holder to further study, £40 (k) Agnes Guthrie Bursary, value £60, is offered annually to students who desire to pursue a full course of study for the Licentiate in Dental Surgery (l) Dr Edith Pechey Phipson Post-graduate Scholarship of the value of £40, awarded annually in June It is open to all medical women, preferably coming from India, or going to work in India, for assistance in Post-graduate study (m) Sarah Holborn Scholarship, value £20 a year for three or five years, awarded every alternate year, next award in 1917 Two Richardson Kuhlmann Prizes are given each year, value £12 for proficiency in Clinical Obstetrics, value £8, for proficiency in senior subjects respectively Three Evans Prizes of £3 3s, £2 2s, and £1 1s are given in alternate years on the results of the class examination in Midwifery The Evans Prize for Operative Midwifery, value £5 5s, is awarded yearly The Edith Pechey Phipson Prize in Pharmacology, value £3 3s, is awarded annually There is also a small fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help Prizes and Certificates of Honour are awarded in each class at the end of the session

UNIVERSITY OF DURHAM

Two Diplomas, one Licence, and six degrees are conferred—viz., the Diploma in Public Health, Diploma in Psychiatry, the Licence in Dental Surgery, and the degrees of Bachelor of Medicine, Bachelor of Surgery, Master of Surgery, Doctor of Medicine Bachelor of Hygiene, and Doctor of Hygiene

For the degree of *Bachelor of Medicine* there are four professional examinations The subjects of the First Examination are—Elementary Anatomy Elementary Biology, Chemistry, and Physics The subjects of the Second Examination are—Anatomy and Physiology The subjects for the Third Examination are—Materia Medica and Pharmacy, Pathology Medical Jurisprudence, Public Health, and Pathology and Elementary Bacteriology The subjects of the Fourth Examination are—Medicine, Clinical Medicine and Psychological Medicine, Surgery and Clinical Surgery Midwifery and Gynecology, Therapeutics, and Diseases of the Skin of the Throat, Nose, and Ear and of Children

It is required that at least one of the five years of professional education shall be spent in attendance at the University College of Medicine Newcastle upon Tyne Candidates who have passed the First and Second Examinations of the University will be exempt from First and Second Examinations of the Conjoint Board

For the degree of *Bachelor of Surgery* every candidate must have passed the examination for the degree of Bachelor of Medicine of the University of Durham and must have attended one course of lectures on Operative Surgery and one course on Applied Anatomy Candidates will be required to perform operations on the dead body and to give proof of practical knowledge of the use of surgical instruments and appliances

For the degrees of *Doctor of Medicine* and *Master of Surgery* a candidate must not be less than 24 years of age and must satisfy the University as to knowledge of Greek or German If he has not already satisfied the Matriculation Examiners in either Greek or German he must pass in one of these subjects at one of the ordinary matriculation examinations of the Newcastle division of the University He must also have obtained the degree of Bachelor of Surgery of the University of Durham

and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Surgery, in attendance on the practice of a recognized hospital, or in the naval or military services, or in medical or surgical practice The candidate for the M D degree must present an essay The subjects of examination for the M S are—Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations Clinical Surgery

Doctor of Medicine (without residence)—The University of Durham has instituted a special examination whereby the degree of Doctor of Medicine may be obtained without residence Candidates shall not be under 40 years of age and shall have been in active practice for 15 years as registered medical practitioners They shall produce certificates of moral character from three registered members of the medical profession The fee will be 50 guineas, of which 20 guineas will be retained if the candidate fails to satisfy the examiners

Candidates for any of the above degrees, diplomas or licences, must give at least 28 days' notice to Professor Howden, Secretary, College of Medicine, Newcastle-upon-Tyne In the case of the M D (essay) examination candidates must send in their essays six weeks before the date of the examination

Professors—Principles and Practice of Medicine Sir G H Philipson, M D, Dr David Drummond and Sir T Oliver M D Psychological Medicine Dr T W McDowall Surgery Mr James Rutherford Morison, Mr Henry Branton Angus and Mr G Grey Turner Ophthalmology Mr John Dobson Wardale Midwifery and Diseases of Women and Children Professor R P Ranken Lyle Pathology Professor Stuart McDonald Medical Jurisprudence Professor Robert A Rolam Public Health Professor Thomas Eustace Hill Therapeutics Professor Thomas Beattie Anatomy Professor Robert Howden, demonstrators Dr James Dunlop Lickley and Dr E P Stibbe Applied Anatomy Mr John Clay Physiology Professor James Acworth Menzies Materia Medica and Pharmacology Dr W E Hume Comparative Pathology and Bacteriology Professor H J Hutchens, lecturer, Mr Percy Charles W Laws, demonstrator (vacant), assistant demonstrator Dr George Hall

Scholarships and Prizes—In connexion with this University the following Scholarships and prizes are awarded—(a) (b) (c) and (d) Four Scholarships of £25 a year each, tenable for four years, the examination will be the September Matriculation Examination Candidates must take English Latin, Arithmetic, Euclid, Algebra Geography English History, with Greek or German, or both (See College Calendar for special books) Open to candidates desirous of being admitted as Medical Students The successful candidates must take out their entire curriculum at the University of Durham College of Medicine Newcastle upon Tyne (e) Pears Scholarship of £50 a year (when vacant) tenable for three years, Matriculation Examination—At the College of Medicine are (f) Dickinson Scholarship, interest on £400 and gold medal, examination in Medicine, Surgery, Midwifery, and Pathology Open to full students of the College of Medicine who have passed the third M B Examination (g) Tulloch Scholarship interest on £400, examination in Elementary Anatomy Biology Chemistry, and Physics (h) Charlton Memorial Scholarship, interest on £700, examination in Medicine Open to full students of the College entered for the class in Principles and Practice of Medicine (i) Gibb Scholarship interest on £500, awarded annually as a Scholarship in Pathology to full student who passes the best examination in that subject No student is eligible after completion of his curriculum (j) Luke Armstrong Memorial Scholarship interest on £680 Original Essay on some subject in Comparative Pathology (If no essay of sufficient merit is presented the scholarship may be awarded to the candidate who, in passing the first part of the Examination for the B Hy Degree, obtains the highest number of marks in Comparative Pathology during the year) Open to all Graduates in Medicine or Hygiene and candidates for the degrees who have spent six months at the University and whose age does not exceed 30 years (k) Stephen Scholarship interest on £1000, Original Essay on a Surgical subject Open to any graduate in Medicine or Surgery of the University or any student of the C

George Heaton Honorary Consulting Surgeon Mr D C Lloyd Owen Surgeons Mr E W Wood White, Mr J Jameson Evans, and Mr W H Fulford Eales Assistant Surgeons Mr T Harrison Butler, Mr R Beatson Hird, and Mr D Priestley Smith Dental Surgeon Mr John Westwood. Anaesthetist Dr S W Haynes Radiographers Mr Hall Edwards and Mr Emrys-Jones Pathologist Dr E W Assinder This hospital possesses 108 beds and there is an average daily attendance of out-patients of over 250 This institution is recognised by Universities and the Royal College of Surgeons, England, and Royal College of Physicians, London, as an ophthalmic hospital at which clinical instruction in ophthalmology may be received Students attending for a period of three months will be granted certificates which will qualify for the University and Conjoint Board examinations

UNIVERSITY OF LIVERPOOL.

The degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M B and Ch B) Doctor of Medicine (M D), Master of Surgery (Ch M), and Master of Hygiene (M H)

Degrees of Bachelor of Medicine and Bachelor of Surgery—Candidates for the degrees of Bachelor of Medicine and of Surgery must have attained the age of 21 years on the day of graduation At least two of the five years of medical study must have been passed in the University, and one year at least must have been passed in the University subsequently to the date of passing the First Examination The other three years may be passed at any college or medical school recognised for this purpose by the University Candidates must pass three examinations entitled respectively the First Examination the Second Examination, and the Final Examination The fee is £5 for each examination The subjects of the First Examination are (1) Chemistry, Inorganic, Organic, and Physical, (2) Biology (Zoology and Botany), and (3) Physics. The examination is divided into two parts—namely (1) Chemistry and Physics, and (2) Biology, and candidates may present themselves in these parts separately The subjects of the Second Examination are (a) Anatomy and Physiology (including Physiological Chemistry and Histology), and (b) Materia Medica Pharmacy, and Pharmacology Candidates may present themselves in (a) or (b) separately The subjects for the Final Examination are (1) General Pathology and Morbid Anatomy, (2) Therapeutics, (3) Forensic Medicine and Toxicology, (4) Public Health, (5) Obstetrics and Diseases of Women (6) Surgery Systematic Clinical Operative and Practical including Ophthalmology, and (7) Medicine Systematic and Clinical including Mental Diseases and Diseases of Children The Final Examination is divided into three parts the first consisting of subject (1) the second of subjects (2) (3) and (4) the third of subjects (5), (6) and (7) Candidates may present themselves in these parts separately Candidates for the third part must have completed the fifth year of medical study

Degrees of Doctor of Medicine and Master of Surgery—No candidate will be admitted to the degree of Doctor of Medicine or Master of Surgery unless he has previously received the Degrees of Bachelor of Medicine and Bachelor of Surgery, and at least one year has elapsed since he passed the examinations for those degrees Candidates for the degree of Doctor of Medicine are required to present a dissertation embodying the results of personal observations or original research either in some department of medicine or of some science directly relative to medicine provided always that onal work published in scientific journals or separately shall be admissible in lieu of or in addition to a dissertation specially written for the degree

Professors—Inorganic Chemistry E O O Baly, FRS Physical Chemistry W C McC Lewis, M.A. DSc Organic Chemistry R Robinson DSc Physiology J S Macdonald, B.A. Physics L R Wilberforce M.A. Natural History W A Herdman, DSc, FRS Botany R J H Gibson, M.A. Anatomy A Melville Paterson, M.D. Medicine T Robinson Glynn M.D. Surgery Rushton Parker FRCS Regional Surgery W Thelwall Thomas Ch.M. At this University the following Scholarships and Fellowships and Prizes are awarded—(a) and (b) Robert Gee Entrance Scholarships, two annually, of £25 each, tenable for two years, Joint Matriculation Board Examination held in July, open to First M B Course Students, (c) Lyon Jones Scholarship, No 1, of £21 per annum, tenable for two years, Competitive Examination among Junior Students in First M B Subjects, Perpetual Course at the University, (d) Lyon Jones Scholarship, No 2, of £21, Competitive Examination among Senior Students in Anatomy, Physiology Pharmacology, and Materia Medica, (e) Derby Exhibition of £15 Competitive Examination among Fourth- or Fifth year Students in Clinical Subjects, and Clinical School Exhibition of £15 annually for Fourth or Fifth year students, (f) University Scholarship of £25 for one year, awarded on results of Second Examination for the degrees, (g) Holt Fellowships Physiology and Pathology of £100 each for one year, (h) Gee Fellowship, Anatomy, of £100 for one year, (i) Alexander Fellowship, Bacteriology and Pathology, of £100, for one year, (j) Johnston Colonial Fellowship Bio Chemistry, of £100, for one year, (k) John W Garrett International Fellowship, Bacteriology, of £100, for one year, (l) Thelwall Thomas Fellowship, Surgical Pathology, of £100 for one year, (m) Ethel Boyce Fellowship in Gynecological Pathology, of £100 for one year, numerous prizes and medals

Medical School Buildings—Medical research has also been endowed with several new laboratories in which students can pursue research work after graduation All the laboratories and class rooms are situated close together, communicating with one another, and are made up of four large blocks of buildings which form one side of the College quadrangle There are the Johnston Laboratories for Experimental Medicine, Bio-Chemistry, and Tropical Medicine, the Medical School for Anatomy Surgery, Toxicology, and Ophthalmology, and the Thompson Yates Laboratories for Physiology and Pathology

Clinical Instruction—The Clinical School of the University now consists of four general hospitals—the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital, and of five special hospitals—the Eye and Ear Infirmary the Hospital for Women, the Infirmary for Children St Paul's Eye Hospital and St. George's Hospital for Skin Diseases These hospitals contain in all a total of about 1134 beds. The organisation of these hospitals to form one teaching institution provides the medical student and the medical practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom All the hospitals are within easy access of the University There are a large number of appointments to house physicianships and surgeons both at the general and special hospitals which are open to qualified students of the school

School of Veterinary Science—There is a school of Veterinary Science in connexion with the University which provides full courses of instruction for the M R C V S Degrees of B V Sc M V Sc, and D V Sc, together with a diploma in Veterinary Hygiene, are also granted by the University

Public Health Department—This is located in a separate building known as Ashton Hall in which full courses of instruction are given to students for the Diplomas and Degrees of the University and of other Examining Boards

Special Diplomas—The University has instituted diplomas in Anatomy Bacteriology Bio-chemistry and Parasitology A special course of study of three terms duration is required in the subject chosen for the diploma and allied subjects

Prospectuses and further information may be had on application to the Dean of the Faculty of Medicine University of Liverpool

Staff of the Royal Infirmary—Consulting Physicians Dr T R Girvan Dr R Caton and Sir James Barr Physicians Dr T R Bradshaw Dr J Hill Abram and Dr R J M Buchanan Assistant Physicians Dr John Hay and Dr W Barnett Warrington Consulting Surgeons Mr Rushton Parker and Mr F T Paul Surgeons Mr R A Bickersteth

BIRMINGHAM AND MIDLAND FRY HOSPITAL
 100, Corporation Street, Birmingham.—Honorary Consulting Physician
 J. Saunders—Honorary Consulting General Surgeon

The Medical School—This medical school is located in a large building, which forms a part of the University. It is provided with large dissecting rooms, physiological laboratories, private laboratories, and work-rooms, besides lecture-rooms, a museum, and a library. In order to give the fullest possible opportunities for teaching and investigation in the departments of Anatomy, Physiology, Pathology and Materia Medica, a large extension of the school buildings was made in 1895. A special laboratory, under the charge of Dr T. Graham Brown, is equipped for experimental work on the central nervous system. In the pathological laboratories ample provision is made for the teaching of pathology and bacteriology and for the prosecution of original research. The Helen Swindells Laboratory under the charge of Dr Powell White, is specially equipped for cancer research and investigation in general pathology. In the public health department, which is lodged in a separate institute in York Place, near the Royal Infirmary, suitable laboratory accommodation is provided for the study of sanitary chemistry, physics and practical bacteriology in the departments of chemistry and physics and in that of pathology.

Clinical Studies—The clinical and practical departments of medical study are taught partly in the Medical School and partly in the Royal Infirmary and St Mary's Hospitals for Women and Children, as well as in a fever hospital, a lunatic asylum and a convalescent home. Medical and Surgical Clinical Classes are conducted in the Infirmary which together with the associated hospitals at Cheadle contains 1158 beds, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis in Obstetric Medicine, Ophthalmic Surgery, and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary.

Clinical Instruction—THE MANCHESTER ROYAL INFIRMARY—The new Royal Infirmary has been built on the pavilion system near the University between the recently enlarged Eve Hospital and the new St Mary's Hospital for Women and Children, and has accommodation for 836 (including 422 temporary military beds). Excluding military beds 46 are allotted to the Special and Emergency Departments, the 360 remaining beds are allocated as follows: 120 for medical practice and 240 for surgical practice (144 for men and 96 for women and children). The medical side consists of five units, each unit having a testing room for the scientific investigation of morbid products and a class-room. The surgical beds are also arranged in five units each unit having its own operation theatre with anaesthetising, recovery, sterilising testing and apparatus rooms, and its own class room attached. Of these units all are occupied. The fine educational block provides very handsomely for the wants and comforts of the students: there being separate suites of rooms for the men and the women, and also a large common reading room, a lecture theatre, and a museum. The present annual average number of in-patients is 10,000, of out- and home patients 32,000, and the list of casualties in the accident room has averaged 22,000 per annum. About 3000 operations are performed annually in the operation theatres. Associated with the infirmary are (1) the Convalescent Hospital at Cheadle containing 136 beds, (2) the Royal Lunatic Hospital at Cheadle, accommodating with its branches 430 patients and (3) the Central Branch in the city for casualty and out-patient work, and 60 temporary military beds. The Associated Hospitals thus contain 1402 beds and are under the same management. Women students are admitted to the practice of the Infirmary on the same terms as men.

Fees—Medical Practice Three months 5 guineas, six months 8 guineas, 12 months 12 guineas, full period required by the Examining Boards 42 guineas.

Two Entrance Scholarships in Medicine of the value of £100 each are offered annually by the Council of the Manchester University and the Medical Board of the Manchester Royal Infirmary for proficiency in Arts and Science subjects respectively. Other scholarships and prizes are in the College Syllabus. Numerous annual appointments and junior appointments may be held by those who have attended the practice of the Infirmary.

Staff—Consulting Physicians: Dr Graham Steell, Dr John S. Barr and Dr A. T. Wilkinson. Physicians: Dr F. S. Percival, Dr G. R. Marrar, Dr R. T. Williamson,

Dr E. M. Brockbank, and Dr E. N. Cunliffe. Assistant Physicians: Dr F. Craven Moore, Dr A. Ramsbottom, Dr E. B. Leech, Dr F. E. Tylecote, and Dr C. E. Melland. Professor of Pathology: Dr H. R. Dean. Pathologist: Dr W. B. Anderton. Consulting Surgeons: Mr F. A. Southam and Mr G. A. Wright. Surgeons: Mr W. Thorburn, Mr J. W. Smith, Mr A. H. Burgess, Mr J. H. Ray, and Mr E. D. Telford. Assistant Surgeons: Mr C. Roberts, Mr P. R. Wingley, Mr H. H. Rayner, Mr W. H. Hey, and Mr J. P. Buckley. Anaesthetist: Mr Alexander Wilson. Consulting Obstetric Physician: Dr Lloyd Roberts. Gynaecological Surgeon: Dr A. Donald. Assistant Gynaecological Surgeon: Dr W. E. Fothergill. Ophthalmic Surgeon: Dr A. Hill Griffith. Aural Surgeon: Sir William Milligan. Assistant Aural Surgeon: Mr H. Westmacott. Consulting Dental Surgeon: Mr W. A. Hooton. Dental Surgeon: Mr E. G. Long. Dean: Dr E. M. Brockbank. Resident Medical Officer: Dr W. J. Reid. Resident Surgical Officer: Mr G. B. Warburton. Pathological Registrar: Dr W. B. Anderton. Medical Registrar: Dr D. T. Harris. Surgical Registrar: Mr Howard Buck. Director of the Clinical Laboratory: Dr G. E. Loveday. Assistant Director of the Clinical Laboratory: Miss Hilda K. Brade. Anaesthetists: Mr S. R. Wilson, Mr Edward Mour, Mr E. Falkner Hill, Mr T. Coogan, Mr G. Benton, and Miss Mabel E. May. Assistant Medical Officers: Dr Core, Dr C. E. Lea, and Dr J. F. Ward. Assistant Surgical Officers: Mr W. R. Douglas, Mr E. E. Hughes, and Mr Howard Buck. Surgical Tutor: Mr W. R. Douglas. Medical Officer for Home Patients: Dr George Ashton. Medical Officer for Radiography and Electricity Department: Dr A. E. Barclay. Resident Medical Officer of the Convalescent Hospital, Cheadle: Dr T. A. Black. Resident Superintendent of the Royal Lunatic Hospital at Cheadle: Mr W. Scowcroft. Medical Officer, Central Branch: Mr J. S. Chorlton. General Superintendent and Secretary: Mr F. G. Hazell.

MANCHESTER CHILDREN'S HOSPITAL, Pendlebury, Gartside-street, Manchester, and St Anne's-on-the-Sea.—The hospital contains 188 beds and 24 in the Convalescent Home, St Anne's-on-the-Sea. The medical staff visit the hospital daily at 10 A.M. Clinical instruction is given by the medical staff at the Hospital and Dispensary. Out-patients are seen daily at 9 A.M. at the new Out-patient Department, Gartside-street, Manchester. Consulting Physician: Dr Hutton. Physicians: Dr Heywood, Dr Lapage, and Dr Ashby. Surgeons: Mr C. Roberts, Mr H. H. Rayner, and Mr John Morley. Honorary Consulting Surgeons: Mr G. A. Wright and Mr J. Howson Ray. Honorary Consulting Aural Surgeon: Mr F. H. Westmacott. Surgeon for Throat, Nose, and Ear Diseases: Mr Arnold Jones. Honorary Ophthalmic Surgeon: Mr J. Gray Clegg. Pathologist: Mr A. H. Miller. Anaesthetists: Mr E. Mour and Mr S. R. Wilson. Honorary Dental Surgeon: Mr E. A. T. Green. Resident Medical Officers: Miss Nesta Perry and Miss D. Potts. Medical Officers at the Dispensary: Mr S. N. Mitra, Mr K. B. Pinson, and Mr A. W. Walsh. Medical Officer, X-Ray Department: Dr W. J. S. Bythell. During 1915 there were 2719 in-patients, and 25101 new out-patients were under treatment at the Dispensary, and there were 98275 attendances made by out-patients. Secretary: Mr W. M. Humphry.

THE MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN, Park-place, Cheetham Hill road, Manchester.—The hospital contains 70 beds. Out-patients are seen daily from 8.30 to 10 A.M. Honorary Consulting Physicians: Dr W. N. Maccall, Dr T. C. Railton, and Dr J. J. Cox. Honorary Consulting Surgeons: Mr Frederick A. Southam and Dr A. W. W. Lea. Honorary Physician for Women: Dr T. Arthur Helme. Honorary Surgeon for Women: Dr G. W. Fitz Gerald. Honorary Physicians for Children: Dr A. A. Mumford, Dr A. C. Starrock, and Dr C. Chisholm. Honorary Assistant Surgeon for Women: Dr D. Dougal. Honorary Surgeon for Children: Mr R. Ollerenshaw. Honorary Ophthalmic Surgeon: Dr H. H. McEabb. Honorary Anaesthetists: Mr G. A. Barrow, Dr C. H. Lee, and Dr D. H. Paul. Honorary Clinical Pathologist: Dr J. Staveley-Dick. Pathologist: Dr A. H. Miller. Assistant Medical Officers: Mr R. W. Walsh and Dr R. C. Holt. House Surgeon (Temporarily filled).

Mr W Thelwall Thomas, and Mr Litter Jones Assistant Surgeons Mr R E Kelly Mr F A G Jeans, and Mr H F Woolfenden Consulting Gynecological Surgeon Mr T B Grimesdale. Gynecological Surgeon Mr W Blair-Bell Ophthalmic Surgeon Mr T H. Bickerton Surgeon to the Throat Department Mr Thomas Guthrie. Physician to the Skin Department Dr L Roberts Lock Department Dr F P Wilson X Ray and Radium Departments Dr C Thurston Holland Dental Surgeon Dr S Hallam Chemical Pathologist Dr Walter Ramsden Pathologist Dr E E Glynn Anaesthetists Mr W England, Mr F W Bailey, Mr H. Armstrong, Mr A. J O'Leary Dr Mona Roberts, Mr Bennett Jones, and Mr G F R Smith

Staff of the David Lewis Northern Hospital—Physician Dr John Owen Assistant Physician Dr J M Bligh. Surgeons Mr K W Monsarrat and Mr G C. E. Simpson. Assistant Surgeons Mr J H Rawlinson and Mr T P McMurray Consulting Neurologist Dr W B Warrington. Consulting Ophthalmic Surgeon Mr A. Nimmo Walker. Consulting Gynecological Surgeon Mr H Leith Murray. Consulting Aural Surgeon and Laryngologist Dr Hugh E Jones. Consulting Dental Surgeon Mr Leslie Councell. Surgeon in Charge of Orthopedics and Massage Dr W H Broad Anaesthetists Dr Robert Stevenson, Dr H J Knox Dr W R Pearce, and Mr A J W Cunningham. Pathologist Dr H S Pemberton Medical Officer in Charge of Finsen Light and Roentgen Ray Department Dr W C Oram Bacteriologist Dr L S Ashcroft.

Women are now accepted for resident appointments.

Staff of the Royal Southern Hospital—Consulting Physician Dr W Williams Consulting Surgeon Mr W Alexander Consulting Bacteriologist Professor J M Beattie. Honorary Physicians Dr C J Macalister and Dr J L Roberts. Honorary Surgeons Mr R Jones, Mr G P Newbolt, and Mr Douglas-Crawford. Honorary Assistant Surgeons Mr T R W Armour and Mr O H Williams. Honorary Dermatologist Dr F H Barendt. Honorary Ophthalmic Surgeon Mr R J Hamilton. Honorary Laryngologist Dr W Permevan. Honorary Assistant Laryngologist Dr W Sanderson Radiologist Dr D Morgan Honorary Dental Surgeon Mr L Osborn Anaesthetists Dr F M Gardner Medwin Dr W J Bennett Jones Dr G F R Smith, and Dr T E Jones.

Staff of the Stanley Hospital—Consulting Physicians Dr R I Richardson and Dr W Whitford. Physicians Dr A. G. Gullan and Dr J Murray Bligh Surgeons Mr F C Larkin and Mr A. J Evans Gynecology Miss F Irens, M B, M S Ophthalmic Physician Dr J Grimshaw Laryngologist Dr J E McDougall Dentist Mr J Woodford Williams

THE VICTORIA UNIVERSITY OF MANCHESTER.

Four degrees in Medicine and Surgery are conferred by the University—viz., Bachelor of Medicine and Bachelor of Surgery (M B and Ch B.), Doctor of Medicine (M D), and Master of Surgery (Ch M). A Diploma in Psychological Medicine is awarded by examination to registered medical practitioners.

Degrees of Bachelor of Medicine and Bachelor of Surgery—Before admission to the degree of M B or Ch B candidates are required to present certificates that they will have attained the age of 21 years on the day of graduation and that they have pursued the courses of study required by the University Regulations during a period of not less than five years subsequently to the date of their registration by the General Medical Council, two of such years having been passed in the University and one year at least having been passed in the University subsequently to the date of passing the first M B Examination. All candidates for the degrees of Bachelor of Medicine and Bachelor of Surgery are required to satisfy the examiners in the several subjects of the following examinations: the First Examination, the Second Examination, the Third Examination and the Final Examination.

The First Examination—The subjects of examination are as follows—(1) Inorganic Chemistry and Physics, (2) Biology, and (3) Elementary Organic Chemistry and Bio-Chemistry. Candidates must have attended during at least one year courses both of lectures and of laboratory work in each of the above-named subjects. The Examination is divided into three parts. Part 1, Inorganic Chemistry

and Physics, Part 2, Biology, Part 3, Elementary Organic Chemistry and Bio-Chemistry, and the candidates may pass in these parts separately under certain conditions.

The Second Examination—The subjects of examination are as follows—(1) Anatomy, (2) Physiology, including Physiological Chemistry and Histology. Candidates may pass in (1) and (2) separately under certain conditions.

The Third Examination—(1) Pathology, (2) Pharmacology and Therapeutics, (3) Hygiene. These subjects may be taken separately under certain conditions.

The Final Examination—The subjects of examination are as follows—(1) Medicine, Systematic and Clinical (including Mental Diseases and Diseases of Children), (2) Surgery, Systematic, Clinical, and Practical, (3) Obstetrics and Gynecology (including Clinical and Practical), (4) Forensic Medicine (including an Oral Examination). These subjects may be taken separately under certain conditions.

Candidates for the Final Examination must have completed the fifth year of medical study.

Degree of Doctor of Medicine—Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates may elect either (1) to present an original dissertation, or (2) to undergo an examination. The dissertation must embody the results of personal observation or original research, either in some department of medicine or of some science directly relative to medicine. The examination, which will be partly written, partly practical, is in the Principles and Practice of Medicine, in Pathology and in some other subject to be selected by the candidate.

Degree of Master of Surgery—Candidates are not eligible for the degree of Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. The subjects of examination are as follows: (1) Surgical Anatomy, (2) Surgery, (3) Operative Surgery, (4) Clinical Surgery, (5) Ophthalmology, and (6) Pathology and Bacteriology.

Scholarships, Fellowships, and Prizes—At this University there are 22 Foundation Scholarships, 12 Exhibitions, five being for subjects connected with medical study, a Surgical Prize, a Fellowship Research Fellowships in Public Health, and Honorary Research Fellowships. 13 Scholarships are Entrance Scholarships one is Medical and there are one each for Surgery Biology Physiology and Diseases of Children and one General Medical and Surgical. Three of the Exhibitions are for Physiology one for Anatomy, and one for French and German. The Surgical Prize named 'The Dumville,' is awarded on the results of the Final Examination in Surgery in the Summer Term, £15. The Leech Fellowship (£100) is for the encouragement of study and research and is open to persons who have graduated M.B., Ch.B. in the University not more than 18 months previously. The Honorary Research Fellowships, tenable for two years, conferring the right of free use of the laboratories, are awarded generally in October on application with evidence of capacity for independent investigation. There are many entrance scholarships the examinations for which are held in the month of May. Full particulars can be obtained from the Dean.

The Medical School—This medical school is located in a large building, which forms a part of the University. It is provided with large dissecting rooms, physiological laboratories, private laboratories, and work rooms, besides lecture rooms, a museum, and a library. In order to give the fullest possible opportunities for teaching and investigation in the departments of Anatomy, Physiology, Pathology, and Materia Medica, a large extension of the school buildings was made in 1895. A special laboratory, under the charge of Dr T. Graham Brown, is equipped for experimental work on the central nervous system. In the pathological laboratories ample provision is made for the teaching of pathology and bacteriology and for the prosecution of original research. The Heisen Swindells Laboratory under the charge of Dr Powell White, is specially equipped for cancer research and investigation in general pathology. In the public health department, which is lodged in a separate institute in York Place, near the Royal Infirmary, suitable laboratory accommodation is provided for the study of sanitary chemistry, physics and practical bacteriology in the departments of chemistry and physics and in that of pathology.

Clinical Studies—The clinical and practical departments of medical study are taught partly in the Medical School and partly in the Royal Infirmary and St Mary's Hospitals for Women and Children, as well as in a fever hospital, a lunatic asylum and a convalescent home. Medical and Surgical Clinical Classes are conducted in the Infirmary, which together with the associated hospitals at Cheadle contains 1158 beds, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis in Obstetric Medicine, Ophthalmic Surgery, and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary.

Clinical Instruction—THE MANCHESTER ROYAL INFIRMARY—The new Royal Infirmary has been built on the pavilion system near the University, between the recently enlarged Eye Hospital and the new St Mary's Hospital for Women and Children, and has accommodation for 836 (including 422 temporary military beds). Excluding military beds 48 are allotted to the Special and Emergency Departments, the 360 remaining beds are allocated as follows: 120 for medical practice and 240 for surgical practice (144 for men and 96 for women and children). The medical side consists of five units, each unit having a testing room for the scientific investigation of morbid products and a class-room. The surgical beds are also arranged in five units, each unit having its own operation theatre, with anaesthetising, recovery, sterilising testing and apparatus rooms and its own class-room attached. Of these units all are occupied. The fine educational block provides very handsomely for the wants and comforts of the students there being separate suites of rooms for the men and the women and also a large common reading room, a lecture theatre, and a museum. The present annual average number of in-patients is 10,000 of out- and home patients 32,000, and the list of casualties in the accident room has averaged 22,000 per annum. About 3000 operations are performed annually in the operation theatres. Associated with the infirmary are (1) the Convalescent Hospital at Cheadle containing 136 beds, (2) the Royal Lunatic Hospital at Cheadle, accommodating with its branches 430 patients and (3) the Central Branch in the city for casualty and out-patient work, and 60 temporary military beds. The Associated Hospitals thus contain 1402 beds and are under the same management. Women students are admitted to the practice of the Infirmary on the same terms as men.

Fees—Medical Practice. Three months 5 guineas, six months 8 guineas, 12 months 12 guineas, full period required by the Examining Boards 42 guineas.

Two Entrance Scholarships in Medicine of the value of £100 each are offered annually by the Council of the Manchester University and the Medical Board of the Manchester Royal Infirmary for proficiency in Arts and Science subjects respectively. Other scholarships and prizes are in the College Syllabus. Numerous annual appointments and junior appointments may be held by those who have attended the practice of the Infirmary.

Staff—Consulting Physicians: Dr Graham Steel, Dr J. S. Barr, and Dr A. T. Wilkinson. Physicians: Dr F. S. Reynolds, Dr G. R. Murray, Dr R. T. Williamson,

Dr E. M. Brockbank and Dr E. N. Canliffe. Assistant Physicians: Dr F. Craven Moore, Dr A. Ramsbottom, Dr E. B. Leech, Dr F. E. Tylecote, and Dr C. E. Melland. Professor of Pathology: Dr H. R. Dean. Pathologist: Dr W. B. Anderton. Consulting Surgeons: Mr F. A. Southam and Mr G. A. Wright. Surgeons: Mr W. Thorburn, Mr J. W. Smith, Mr A. H. Burgess, Mr J. H. Ray, and Mr E. D. Telford. Assistant Surgeons: Mr C. Roberts, Mr P. R. Wrigley, Mr H. H. Rayner, Mr W. H. Hey, and Mr J. P. Buckley. Anaesthetist: Mr Alexander Wilson. Consulting Obstetric Physician: Dr Lloyd Roberts. Gynecological Surgeon: Dr A. Donald. Assistant Gynecological Surgeon: Dr W. E. Fothergill. Ophthalmic Surgeon: Dr A. Hill Griffith. Aural Surgeon: Mr W. H. Westmacott. Assistant Aural Surgeon: Mr F. H. Westmacott. Consulting Dental Surgeon: Mr W. A. Hooton. Dental Surgeon: Mr E. G. Long. Dean: Dr E. M. Brockbank. Resident Medical Officer: Dr W. J. Reid. Resident Surgical Officer: Mr G. B. Warburton. Pathological Registrar: Dr W. B. Anderton. Medical Registrar: Dr D. T. Harris. Surgical Registrar: Mr Howard Buck. Director of the Clinical Laboratory: Dr G. E. Loveday. Assistant Director of the Clinical Laboratory: Miss Hilda K. Brade. Anaesthetists: Mr S. R. Wilson, Mr Edward Moir, Mr E. Falkner Hill, Mr T. Coogan, Mr G. Benton, and Miss Mabel E. May. Assistant Medical Officers: Dr Core, Dr C. E. Lea, and Dr J. F. Ward. Assistant Surgical Officers: Mr W. R. Douglas, Mr E. E. Hughes, and Mr Howard Buck. Surgical Tutor: Mr W. R. Douglas. Medical Officer for Home Patients: Dr George Ashton. Medical Officer for Radiography and Electricity Department: Dr A. E. Barclay. Resident Medical Officer of the Convalescent Hospital, Cheadle: Dr T. A. Black. Resident Superintendent of the Royal Lunatic Hospital at Cheadle: Mr W. Scowcroft. Medical Officer, Central Branch: Mr J. S. Chorlton. General Superintendent and Secretary: Mr F. G. Hazell.

MANCHESTER CHILDREN'S HOSPITAL Pendlebury, Gartside-street, Manchester and St Anne's-on-the-Sea.—The hospital contains 188 beds and 24 in the Convalescent Home, St Anne's-on-the-Sea. The medical staff visit the hospital daily at 10 A.M. Clinical instruction is given by the medical staff at the Hospital and Dispensary. Out-patients are seen daily at 9 A.M. at the new Out-patient Department, Gartside-street, Manchester. Consulting Physician: Dr Hutton. Physicians: Dr Heywood, Dr Lapage, and Dr Ashby. Surgeons: Mr C. Roberts, Mr H. H. Rayner, and Mr John Morley. Honorary Consulting Surgeons: Mr G. A. Wright and Mr J. Howson Ray. Honorary Consulting Aural Surgeon: Mr F. H. Westmacott. Surgeon for Throat, Nose and Ear Diseases: Mr Arnold Jones. Honorary Ophthalmic Surgeon: Mr J. Gray Clegg. Pathologist: Mr A. H. Miller. Anaesthetists: Mr E. Moir and Mr S. R. Wilson. Honorary Dental Surgeon: Mr E. A. T. Green. Resident Medical Officers: Miss Nesta Perry and Miss D. Potts. Medical Officers at the Dispensary: Mr S. N. Mitra, Mr K. B. Puxon, and Mr A. W. Walsh. Medical Officer X-Ray Department: Dr W. J. S. Bythell. During 1915 there were 2719 in-patients, and 25101 new out-patients were under treatment at the Dispensary, and there were 96,275 attendances made by out-patients. Secretary: Mr W. M. Humphry.

THE MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN Park place, Cheetham Hill road, Manchester.—The hospital contains 70 beds. Out-patients are seen daily from 8.30 to 10 A.M. Honorary Consulting Physicians: Dr W. N. MacCall, Dr T. C. Railton, and Dr J. J. Cox. Honorary Consulting Surgeons: Mr Frederick A. Southam and Dr A. W. W. Lea. Honorary Physician for Women: Dr T. Arthur Helme. Honorary Surgeon for Women: Dr G. W. Fitz Gerald. Honorary Physicians for Children: Dr A. A. Vamford, Dr A. C. Sturrock, and Dr C. Chisholm. Honorary Assistant Surgeon for Women: Dr D. Dougal. Honorary Surgeon for Children: Mr R. Ollerenshaw. Honorary Ophthalmic Surgeon: Dr H. H. McNabb. Honorary Anaesthetists: Mr G. A. Barrow, Dr C. H. Lee, and Dr D. H. Paul. Honorary Clinical Pathologist: Dr J. Staveley-Dick. Pathologist: Dr A. H. Miller. Assistant Medical Officers: Mr R. W. Walsh and Dr R. C. Holt. Honorary Surgeon (Temporarily filled).

UNIVERSITY OF LEEDS

Four degrees in Medicine and Surgery are conferred—viz. Bachelor of Medicine and Bachelor of Surgery (M B and Ch B), Doctor of Medicine (M D), Master of Surgery (Ch M), also Degrees and Diplomas in Dental Surgery and Diploma in Public Health. A Diploma in Psychological Medicine is also granted.

Degrees of Bachelor of Medicine and Bachelor of Surgery—Candidates for the degrees of Bachelor of Medicine and of Surgery are required to present certificates showing that they will have attained the age of 21 years on the day of graduation, and have attended courses of instruction approved by the University extending over not less than five years, two of such years at least having been passed in the University subsequently to the date of passing the First Examination. Candidates must also satisfy the examiners in the several subjects of the following examinations entitled respectively the Matriculation Examination or such other examination as may have been recognised by the Joint Matriculation Board in its stead, the First Examination, the Second Examination, and the Final Examination.

The First Examination—The First Examination consists of Part I, Physics and Chemistry, Part II, Biology. Candidates will be allowed to pass the two parts separately.

The Second Examination—The Second Examination consists of Part I, Anatomy and Physiology, Part II, Materia Medica and Pharmacy. Candidates will be allowed to pass the two parts separately.

The Final Examination—The Final Examination consists of Part I, Pathology and Bacteriology, Part II, Forensic Medicine and Public Health, Part III, Medicine Systematic and Clinical, including Mental Diseases and Diseases of Children, Surgery Systematic, Clinical, and Practical, Obstetrics, and Gynaecology Systematic Clinical and Practical, Pharmacology and Therapeutics. Candidates will be allowed to pass Parts II and III separately or together, and they may present themselves for examination in Part I at the end of the tenth term.

Degree of Doctor of Medicine—Candidates are not eligible for the degree of Doctor of Medicine or Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees. Candidates for the degree of Doctor of Medicine are required to present a dissertation and, if the dissertation be accepted, to pass an examination.

Professors—Physics W Bragg, M.A., F.R.S. Chemistry A Smithells, B.Sc., F.R.S. Organic Chemistry J B Cohen, B.Sc., Ph.D., F.R.S. Zoology W Garstang, M.A., D.Sc. Botany J H Priestley. Anatomy J K Jamieson, M.B., O.M. Physiology and Histology De Burgh Birch, M.D., C.M., F.R.S.E. Pathology A S Leyton, M.A., M.D., Sc.D., F.R.C.P., D.P.H. Clinical Medicine A G Barrs, M.D., F.R.C.P. Medicine T W Griffith, M.D., F.R.C.P. Surgery R L Knaggs, M.A., M.D., M.O., F.R.C.S. Clinical Surgery Sir B G A Moynihan, M.S., F.R.C.S. Obstetrics J B Heller, M.D. Public Health W Angus, M.D., D.P.H. (Acting Professor). Therapeutics H J Campbell, M.D., F.R.C.P. Forensic Medicine F W Eurch, M.D., O.M. Mental Diseases J S Bolton, M.D., D.Sc., F.R.C.P.

Information concerning scholarships and prizes can be obtained from the Dean of the Medical School.

Clinical Instruction—THE LEEDS GENERAL INFIRMARY, in connexion with this medical faculty, has accommodation for 520 in-patients including 88 beds at branch hospitals in the country. During the last year 9319 in-patients and 41,183 out-patients were treated. Clinical teaching takes place daily in the wards and Clinical lectures are given in Medicine and Surgery by the Physicians and Surgeons. There are Medical, Surgical, Ophthalmic, Aural, Electro-therapeutic, and Radiographic Departments in each of which special instruction is imparted to students. A Gynaecological and Extern Obstetric Department, in which there were 410 confinements, together with Laryngeal and Skin Clinics, are in operation. Several valuable prizes are given at the end of each session. Numerous appointments at the Infirmary are annually open to students after qualification.

Staff of Leeds General Infirmary—Consulting Physicians Sir Thomas Clifford Allbutt, K.O.B., Dr John E Eddison,

Dr Charles M Chadwick, and Dr Alfred George Barrs. Consulting Surgeons Mr Thomas Pridgen Teale, Mr A W Mayo Robson, Mr Edward Ward, and Mr Harry Littlewood. Physicians Dr Thomas Churton, Dr T Wardrop Griffith, and Dr W H Maxwell Telling. Surgeons Mr R Lawford Knaggs, Sir Berkeley Moynihan, Mr Walter Thompson, and Mr J Faulkner Dobson. Ophthalmic Surgeons Mr H Secker Walker and Mr A L Whitehead. Ear, Nose, and Throat Surgeons Mr G Constable Hayes and Mr E W Bain. Obstetric Physician Dr J B Heller. Assistant Physicians Dr Geo W Watson, Dr R A Veale, and Dr O W Vining. Assistant Surgeons Mr H Colhoun, Mr L R Branthwaite, Mr J A Coupland, and Mr S W Daw. Pathologist Dr A S Leyton. Dental Surgeon Mr J B Hordern. Director of the Electro-Therapeutic Department Mr L A Rowden. Clinical Pathologist Mr M J Stewart. Assistant Clinical Pathologist (Vacant). Medical Tutor Dr J Le F O Burrow. Surgical Tutor Mr A Richardson. Anaesthetists Dr Douglas Seaton, Dr S T Rowling, Dr F Whalley, Dr Macvean, Dr F Marshall Greaves, Dr A E Hutton, Dr C T Matthews, Dr W Maxwell Munby, Dr R H B Adamson, and Dr C E Dawson. General Manager Mr Fred J Bray.

UNIVERSITY OF SHEFFIELD

The Degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M B Ch B), Doctor of Medicine (M D), and Master of Surgery (Ch M). The courses and degrees in the Faculty of Medicine are open to men and women alike.

Candidates for a medical degree shall have matriculated in the University or have passed such other examination as may be recognised for this purpose by the University and sanctioned by the Joint Matriculation Board.

A candidate for the degrees of M B, Ch B, shall produce certificates that he will have attained the age of 21 years on the day of graduation, that he has pursued the courses of study required by the University regulations during a period of not less than five years subsequently to the date of his matriculation, three of such years at least having been passed in the University one at least being subsequent to the passing of the First Examination.

Degrees of Bachelor of Medicine and Bachelor of Surgery

The First Examination—The subjects of the examination are Chemistry, Physics, and Biology. The Intermediate B.Sc. Examination in these subjects will, on payment of the required additional fee, be accepted instead of this examination. Candidates must, after matriculation and registration as medical students have attended courses of instruction (lectures and laboratory work) in chemistry, physics, and biology for one year each.

The Second Examination—The subjects of the examination are Anatomy and Physiology.

The Third Examination—The subjects of the examination are Pathology and Pharmacology. A candidate entering for the first, second, or third examination who shall pass creditably in one subject of either examination and obtain a certain minimum of marks in the other, may enter for such other subject separately in a subsequent examination. Candidates must have completed the fourth year of professional study.

The Final Examination—The subjects of the examination are Medicine (including Forensic Medicine, Public Health, Mental Diseases, and Diseases of Children), Surgery, and Obstetrics (including Gynaecology). Candidates must satisfy the examiners in all subjects at the same examination. Candidates must have completed the fifth year of professional study.

Degree of Doctor of Medicine—Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M B, Ch B at least one year previously, must present a thesis embodying observations in some subject approved by the professor of medicine and must pass an examination in the Principles and Practice of Medicine.

Degree of Master of Surgery—Candidates for the degree of Ch M must have passed the examination for the degrees of M B, Ch B at least one year previously, and must, since taking the degrees of M B, Ch B, have held for not less than six months a surgical appointment in a public hospital.

or other public institution affording full opportunity for the study of Practical Surgery.

The subjects of examination are Systematic, Clinical and Operative Surgery, Surgical Anatomy, Surgical Pathology, and Bacteriology.

Professors—Physics W. M. Hicks Sc.D., F.R.S. Chemistry W. Palmer Wynne D.Sc. F.R.S. Biology Alfred Denny M.Sc. F.L.S. Anatomy C. J. Patten M.A. M.D. Sc.D. Physiology J. B. Leathes M.B., F.R.S. Medicine A. J. Hall, M.A., M.D. F.R.C.P. Surgery Sinclair White, M.D., M.Ch. F.R.C.S. Pathology J. Sholto C. Douglas, M.A. M.D. Midwifery P. E. Barber B.A. M.R.C.S. L.R.C.P. Public Health H. Scarfield M.D. D.P.H. Dean of the Medical Faculty J. B. Leathes M.B. F.R.S.

Scholarships &c.—At this University in addition to four Edgar Allen scholarships of £100 a year for three years holders of which can take the courses in the Faculty of Medicine, there are 8 scholarships and a Town Trust Fellowship. Full particulars as to curriculum scholarships &c., may be had on application to the Registrar or to the Dean of the Medical Faculty.

The Medical School—The new buildings of the University opened in 1905 are situated at the west end of the city, adjoining Weston Park and the Medical Department occupies the entire north wing of the University quadrangle. The various athletic and other students' societies are under the management of a Students' Representative Council, elected annually. There are large and comfortable common rooms both for men and women students. A refectory is open daily at the University where students may obtain refreshments lunch dinner &c., at extremely moderate prices. The University journal *Floreat* edited by a committee of staff and students is published each term. The University Hostel, Ashgate road, is recognised by the Senate as a residence for women students, full particulars of which may be obtained of the tutor for women students.

Clinical Instruction—The University is within easy reach of the various hospitals with which it is connected for clinical purposes. These are as follows: The Royal Infirmary containing 320 beds with an annual average number of over 3500 in patients over 11 500 out-patients and over 23 000 casualties; the Royal Hospital with 191 beds and an annual number of 3000 in patients over 20 000 out-patients and nearly 20 000 casualties; and the Jessop Hospital for Diseases of Women with 60 beds about 750 in patients and over 3000 out-patients also a Maternity department with about 450 in patients per annum and about 700 out-patient cases attended. Special courses on Fevers are held at the City Fever Hospital (570 beds) and on Mental Diseases at the South Yorkshire Asylum (1610 beds). For purposes of clinical practice the practices of the Royal Infirmary and Royal Hospital are amalgamated giving a total of 511 beds for the treatment of medical, surgical and special cases. There are special departments for the treatment of Diseases of the Eye at each institution with wards assigned to them. In addition to these the Royal Infirmary has special departments for the treatment of Diseases of the Skin and Ear with beds assigned to them whilst at the Royal Hospital there are special out-patient departments for Diseases of the Throat Ear Skin Orthopaedics, and Mental Diseases. During the last year over 6000 patients passed through the wards of the two institutions while those attending as out-patients numbered over 45,000. The department of Pathology and Bacteriology in the University is fitted with every requirement for the most advanced work in these subjects.

Fees—The Composition Fees are as follows: A for University Lectures and Practical Classes £80, B for Clinical Hospital Practice £49 17s. 6d. These two composition fees entitle the student to attendance on all the Lectures Laboratory Classes and Hospital practice (except Pharmacy) required for a Medical and Surgical Degree in the University or for the ordinary qualifying examinations of the various Examining Boards. The composition fees do not cover the cost of apparatus instruments parts for dissection in anatomy &c. all of which must be provided by the student when and as required. The fees are payable in instalments extending over the five years of the curriculum.

Staff of the Royal Infirmary, Sheffield—Physicians Dr W. S. Porter Dr A. E. Barnes, and Dr A. G. Yates. Surgeons Professor Sinclair White, Mr Arthur Connell, and

Mr Archibald Cuff Assistant Surgeons Mr Ernest Finch and Mr T. B. Mount. Dermatologist Dr Rupert Hallam. Honorary Pathologist Professor J. Sholto C. Douglas. Medical Officer to the Far and Throat Department Mr W. S. Kerr. Ophthalmic Surgeon Mr G. H. Pooley. Medical Registrar Dr W. W. King. Medical Officer in Charge of Electrical Department Dr Rupert Hallam. Anaesthetists Dr W. D. Mart, Dr W. Sneddon and Dr T. Robertson. Clinical Pathologist Dr W. W. King. Honorary Secretary to the Medical and Surgical Staff Mr W. S. Kerr. Secretary to the Infirmary Jno. W. Barnes.

Staff of the Sheffield Royal Hospital—Physicians Professor Arthur Hall and Dr A. E. Naish. Surgeons Mr Graham Simpson and Mr Garrick Wilson. Assistant Physician Dr Herbert Henry. Assistant Surgeons Mr Ferguson Wilson and Mr Vincent Townrow. Ophthalmic Surgeon Dr Percival J. Hay. Assistant Ophthalmic Surgeon Mr Herbert Emmerson. Aural Surgeon Dr George Wilkinson. Physician for Mental Diseases Mr Gilbert E. Mould. Medical Officer to the Electrical Department Dr W. Harwood Nutt. Physician for Skin Diseases Dr E. F. Skinner. Anaesthetists Mr Herbert Hallam, Dr C. Graham Murray, Dr R. G. Abercrombie, Dr Vernon Favell and Mr J. B. H. Holrood. Pathologist Professor J. Sholto C. Douglas. Honorary Secretary to the Medical and Surgical Staff Mr Graham Simpson (*pro tem*). Dental Surgeons Mr F. G. Mordaunt, Mr H. J. Morris, Mr P. S. Stokes and Mr H. J. Stoner. Assistant Dental Surgeons Mr R. Cecil Webster, Mr F. W. Goodwin, Mr J. H. Skerritt, Mr W. Skerritt and Mr Frank C. Harrison. Honorary Secretary to the Dental Staff (Vacant).

UNIVERSITY OF BRISTOL

In the Faculty of Medicine there are the following degrees—Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Dental Surgery (B.D.S.), and Master of Dental Surgery (M.D.S.). There are also the following diplomas: Diploma in Public Health (D.P.H.), Diploma in Dental Surgery (L.D.S.) and Diploma in Veterinary State Medicine.

All candidates for degrees in Medicine Surgery and Dentistry are required to pass an examination called the Matriculation Examination, which must include Latin, or to pass such examination as may be regarded as equivalent by the Senate. All courses degrees and diplomas are open to men and women alike.

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery—Candidates shall be not less than 21 years of age and shall have pursued the courses prescribed by University Regulations during not less than five and a half years of which three shall have been passed in the University, and two of these three subsequent to pass in the second examination. All candidates for the degrees of M.B. Ch.B., are required to satisfy the examiners in the several subjects of three examinations: the First Examination, the Second Examination and the Final Examination.

The First Examination—The subjects of examination are Chemistry (Inorganic) Physics and Biology the courses pursued being those for the time being approved for the intermediate part of the B.Sc. curriculum. This part of the curriculum shall extend over one year.

The Second Examination—The subjects of examination are Organic Chemistry and Elementary Anatomy (Part I) and Advanced Anatomy and Physiology (Part II). Parts I and II may be passed separately or together.

The Final Examination—The subjects of examination are Materia Medica and Pharmacy Pharmacology and Therapeutics General Pathology, Morbid Anatomy, and Bacteriology (Part I), Special Pathology Forensic Medicine Toxicology and Public Health, Obstetrics (including Diseases of Women), Surgery (Systematic Clinical, Practical and Operative) Medicine (Systematic Clinical and Practical including Mental Diseases) (Part II). Candidates may pass I and II together or separately, and Forensic Medicine and Toxicology may at the option of the candidate, be taken either with Part I or Part II.

Degree of Doctor of Medicine—Candidates shall be Bachelors of the University of not less than two years standing as such and may elect either (1) to pass an examination in General Medicine or (2) to pass an examination in

State Medicine, or, (3) to present a Dissertation. The candidate who elects to pass the examination in State Medicine must hold a diploma in Public Health of some University or College, and the candidate who elects to present a Dissertation may be examined in the subject thereof.

Degree of Master of Surgery.—Candidates shall be Bachelors of not less than two years as such during which period they shall have attended the Surgical Practice of an institution approved for the purpose. They shall pass an examination in Surgical Anatomy, Pathology, and Bacteriology, and Operative, Clinical, and General Surgery, and present to the University a Dissertation on some subject of Surgery.

Professors.—Chemistry Francis Francis, D.Sc., Ph.D. Anatomy Edward Fawcett, M.D., C.M. (Dean of the Faculty of Medicine) Physiology A.F. Stanley Kent, M.A., D.Sc. Pathology I. Walker Hall, M.D., C.M. Obstetrics W.C. Swayne, M.D., B.S. Surgery O.A. Morton, F.R.C.S., and James Swain, M.D., F.R.C.S. Medicine F.H. Edgeworth, M.D., B.O., D.Sc., and J. Michell Clarke, M.D., LL.D., F.R.C.P.

Clinical Instruction.—The allied hospitals (Bristol Royal Infirmary and Bristol General Hospital) have between them about 600 beds and extensive out-patient departments, special clinics for Diseases of Women and Children and those of the Eye, Throat, and Ear, in addition to large and well equipped departments for Dental work and large outdoor Maternity Departments.

At each of these institutions there are well arranged pathological museums, post-mortem rooms, and laboratories for Morbid Anatomy. There are also laboratories for work in Clinical Pathology, Bacteriology, and Cytology, in which special instruction is given in these subjects. Departments are provided and well equipped for X-ray work, both for diagnosis and treatment, the various forms of Electrical treatment, including High Frequency Currents, Electric Baths, Finsen Light treatment, and Massage.

The students of the school also attend the practice of the Royal Hospital for Sick Children and Women, containing 140 beds, and that of the Bristol Eye Hospital, with 40 beds. The total number of beds available for clinical instruction is therefore about 750.

Staff of the Bristol Royal Infirmary.—Honorary and Consulting Physicians: Dr R. Shingleton Smith, Dr H. Waldo, and Dr J. E. Shaw. Honorary and Consulting Surgeons: Mr E. O. Board, Mr W. H. Harsant, Mr A. W. Prichard, Mr G. Munro Smith, and Mr J. Paul Bush. Honorary and Consulting Ophthalmic Surgeon: Mr F. Richardson Cross. Honorary Physicians: Dr A. B. Prowse, Dr F. H. Edgeworth, Dr J. A. Nixon (Dean of the Faculty of the Royal Infirmary), and Dr J. R. Charles. Honorary Surgeons: Dr J. Swain, Mr T. Carwardine, Mr H. F. Mole, and Mr C. F. Walters. Honorary Ophthalmic Surgeon: Mr E. H. E. Stack. Honorary Obstetric Physician: Dr Walter Swayne. Honorary Dental Surgeon: Mr W. R. Ackland. Honorary Physician to the Nose and Throat Department: Dr P. Watson Williams. Honorary Assistant Physicians: Dr J. M. Fortescue Brickdale and Dr Richard Clarke. Honorary Assistant Surgeons: Mr A. Rendle Short and Mr H. Chitty. Honorary Assistant Dental Surgeon: Mr F. O. Nichols. Pathologist: Dr I. Walker Hall. Honorary Demonstrator of Morbid Anatomy: Dr J. J. S. Lucas. Assistant Pathologist: Dr J. R. Kay Mouatt. Honorary Anaesthetist: Mr A. L. Flemming. Honorary Assistant Anaesthetists: Mr S. V. Stock, Mr Leonard Moore, and Mr B. O. Eskell. Honorary Skiagraphist: Mr James Taylor.

Staff of the Bristol General Hospital.—Honorary and Consulting Physicians: Dr A. J. Harrison and Dr J. Barclay Baron. Honorary and Consulting Surgeons: Mr George F. Atchley, Mr Nelson O. Dobson, Mr F. Poole Lansdown, Mr Chas. F. Pickering, and Mr H. Greville Kyle. Physicians: Dr J. Michell Clarke (Dean of the Faculty of the Bristol General Hospital), Dr George Parker, and Dr J. O. Symes. Surgeons: Mr O. A. Morton, Mr R. G. Poole Lansdown, Mr J. Lacy Firth, and Mr E. W. Hey Groves. Physician Accoucheur: Dr W. H. O. Newham. Physician to Department for Diseases of the Skin: Dr W. Kenneth Wills. Physician in Charge of Out-patients: Dr N. Neild. Surgeon to the Throat and Nose: Mr A. J. Wright. Surgeon to the Ear: Mr J. Lacy Firth. Ophthalmic Surgeon: Mr Cyril H. Walker. Assistant Physicians: Dr Newman Neild and Dr Carey F. Coombs. Assistant Surgeon: Mr C. A. Moore. Assistant

Physician Accoucheur, with charge of Out-patients: Mr D. C. Rayner. Anaesthetists: Dr J. Freeman and Dr Hedley Hill. Dental Surgeon: Mr E. A. G. Dowling. Assistant Dental Surgeon: Mr H. J. Wyatt. Pathologist: Mr G. Scott Williamson. Assistant Anaesthetist: Dr O. Corfield. Curator of Museum: Mr G. Scott Williamson. Electrical Department: Dr George Parker, Dr J. Ellington Jones. Skiagraphist: Dr F. G. Bergin.

Further information as to scholarships, curricula, and fees can be obtained from the Dean of the Faculty of Medicine or the Registrar of the University.

UNIVERSITY OF WALES

This University has the privilege of granting degrees in Medicine and Diplomas in Public Health. At the three constituent Colleges of Aberystwyth, Bangor, and Cardiff there are Professors of Chemistry, Botany, Zoology, and Physics, so that the students of the University can obtain proper instruction in the ancillary subjects. The foundation of a Medical Faculty has been laid at University College, Cardiff, where there is a recognised school of medicine.

University College, Cardiff School of Medicine.—All classes are open to both men and women students who may spend three or four out of their five years of medical study at Cardiff. The courses of instruction given at Cardiff are recognised as qualifying for the examinations of the Universities, Royal Colleges, and other licensing bodies of Great Britain and Ireland, and they are specially adapted to meet the needs of those University students studying for Cambridge and London degrees. Students who are preparing for these examinations may compound for their courses by paying a fee of £63, while a composition fee of £41 10s. includes all the necessary courses for the first and second examinations for the Diploma of the Conjoint Board. In all cases the composition fees may be paid by instalments. Hospital instruction is given at the King Edward VII.'s Hospital, Cardiff. The attention of students about to matriculate is drawn to the numerous entrance scholarships offered for competition at University College, Cardiff, in April next, most of which may be held by medical students. Full particulars of the examination for these may be obtained by application to the Registrar. In the department of Public Health established in 1899 instruction is given qualifying for the D.P.H. examinations. Further information may be obtained from the Dean of the Faculty of Medicine.

Lecturers.—Physics: Professor A. L. Selby. Chemistry: Professor O. M. Thompson. Zoology: Professor W. N. Parker. Botany: Professor A. H. Trow. Anatomy: Professor David Hepburn. Physiology: Professor J. B. Haycraft. Materia Medica and Therapeutics: Dr W. Mitchell Stevens. Pathology and Bacteriology: Professor Emrys Roberts. Hygienic Chemistry: Mr J. H. Sugden. Public Health and Hygiene: Dr E. Walford and Dr D. J. Morgan. Midwifery (for Midwives): Dr E. J. Maclean. Vaccination: Professor Emrys Roberts.

Clinical Instruction.—KING EDWARD VII.'S HOSPITAL, CARDIFF.—Students can attend the practice of this Hospital, which contains 311 beds, 104 beds for military patients. Founded 1837. In-patients, 2260, out-patients, 13,604.

Staff.—Consulting Physician: Dr Herbert Vachell. Consulting Surgeon: Dr T. Wallace. Consulting Dental Surgeon: Mr John C. Oliver. Physicians: Dr Mitchell Stevens and Dr Cyril Lewis. Surgeons: Mr P. Rhys Griffiths, Mr William Sheen, and Mr J. Lynn Thomas. Assistant Physicians: Dr Alfred Howell, Dr Ivor Davies, and Dr Herbert Evans. Assistant Surgeons: Dr H. G. Cook, Mr Cornelius A. Griffiths, and Mr William Martin. Ophthalmic Surgeons: Mr F. P. S. Cresswell and Mr R. Russell Thomas. Assistant Ophthalmic Surgeon: Dr D. Leighton Davies. Gynaecologist: Dr Ewen J. Maclean and Mr E. Tenison Collins. Ear, Throat, and Nose Surgeon: Dr D. R. Paterson. Pathologists: Mr H. A. Schölberg and Professor Emrys Roberts. Sanitary Adviser: Dr E. Walford. Anaesthetist: Mr Frederick W. S. Davies. Assistant Anaesthetists: Mr A. C. Devereux, and Dr J. Sydney Rowlands. Dental Surgeons: Mr W. Kittow and Mr Thomas Quinlan. Electrical Department: Dr Owen L. Rhys. Resident Medical Officer: Dr I. A. Razzak.

SWANSEA GENERAL AND EYE HOSPITAL AND SWANSEA HOSPITAL CONVALESCENT HOME.—Hospital, 72 beds, Convalescent Home, 20 beds Consulting Physicians Dr D A Davies Dr John A Rawlings and Dr J S H Roberts Consulting Surgeons Mr J Thomas, Mr H A Latimer, and Mr W F Brook. Honorary Consulting Gynaecologist Dr R Nelson Jones Physicians Dr E Le C Lancaster and Dr D E Evans Surgeons Mr R C Elsworth, Mr C L Isaac, and Dr W L Griffiths Physician Accoucheur Dr F Knight Gynaecologist Dr Edgar Reid. Ophthalmic Surgeons Dr Frank G Thomas and Dr E Quick. Surgeon to the Throat, Nose, and Ear Department Mr Alban Evans Assistant Physicians Dr A. Clarke Begg and Dr Urban Marks Assistant Surgeons Dr A. W. Cameron and Dr Trevor Evans Vaccine Therapist Dr A. Clarke Begg Medical Officers for Out-door Patients Dr A. W. Cameron Dr Trevor Evans and Dr Urban Marks Surgeon Dentist Mr H J Thomas Electro-Therapeutic Officer Dr D R. Edwards Anaesthetists Dr H. W. ENGLISH MEDICAL CORPORATIONS GRANTING DIPLOMAS

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE ROYAL COLLEGE OF SURGEONS OF ENGLAND

Under this heading we give the regulations for the examinations enjoin by the Conjoint Examining Board of the Royal Colleges of Physicians of London and Surgeons of England and of the Society of Apothecaries upon students desiring their respective diplomas of qualification. We do not give any list of schools recognised by these bodies as eligible to prepare students for their examinations beyond mentioning that all the schools which we have already described (under the heading of the Universities to which they are attached) are recognised as suitable places of instruction by the corporations granting medical diplomas. The courses of study at the principal colonial medical schools are also recognised as qualifying for the examinations of these corporations.

Any candidate who desires to obtain both the Licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England is required to complete five years of professional study at recognised Medical Schools and Hospitals and to comply with the following regulations and to pass the examinations hereinafter set forth. Six months of the curriculum may be spent in an Institution recognised by the Board for instruction in Chemistry, Physics, Practical Chemistry and Biology.

Professional Examinations.—There are three Examinations called herein the First Examination, the Second Examination, and the Third or Final Examination, each being partly written, partly oral and partly practical. These examinations will be held in the months of January, April, July and September or October, unless otherwise appointed. Every candidate intending to present himself for examination is required to give notice in writing to Mr F G Hallett, secretary of the Examining Board Examination Hall, Queen square Bloomsbury, W.C. 14 clear days before the day on which the examination commences transmitting at the same time the required certificates.

The subjects of the First Examination are—Chemistry, Physics, Elementary Biology and Practical Pharmacy. A candidate may take this examination in three parts at different times (Chemistry and Physics must be taken together until the required standard is reached in both or in one of these subjects but a candidate will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other). A candidate will be admitted to examination in Chemistry and Physics in Practical Pharmacy and Elementary Biology on producing evidence of having passed the required Preliminary Examination and of having received instruction in these subjects at a recognised institution but he may take Pharmacy at any time during

the curriculum. A candidate rejected in one part or more of the First Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection, and he will be re-examined in the subject or subjects in which he has been rejected. If referred in Chemistry, Physics or Biology he must produce evidence of further instruction at a recognised institution. Any candidate who shall produce satisfactory evidence of having passed an examination for a degree in Medicine on any of the subjects of this examination conducted at a university in the United Kingdom in India, or in a British colony will be exempt from examination in those subjects in which he has passed.

The fees for admission to the First Examination are as follows. For the whole examination, £10 10s., for re-examination after rejection in Parts I and II £3 3s., and for re-examination in each of the other parts, £2 2s.

The subjects of the Second Examination are Anatomy and Physiology. Candidates will be required to pass in both subjects at one and the same time. Candidates will be admissible to the Second Examination on production of the required certificates of professional study. The study of Anatomy and Physiology before passing in two of first three parts of the First Professional Examination is not recognised.

A candidate referred on the Second Examination will be required before being admitted to re-examination, to produce a certificate that he has pursued to the satisfaction of his teachers, in a recognised place of study his Anatomical and Physiological studies during a period of not less than three months subsequently to the date of his reference.

The fees for admission to the Second Examination are £10 10s. for the whole examination and £6 6s. for re-examination after rejection.

The subjects of the Third or Final Examination are Part I. Medicine, including Medical Anatomy, Pathology, Practical Pharmacy, Therapeutics, Forensic Medicine, and Public Health. Candidates who have passed in Practical Pharmacy at the First Examination will not be re-examined in that subject at the Third Examination. Part II. Surgery including Pathology, Surgical Anatomy and the use of Surgical Appliances. Part III. Midwifery and Diseases Peculiar to Women. Candidates may present themselves for Parts I, II, and III of the examination separately or together at the expiration of not less than two years (24 months) from the date of passing the Second Examination on production of the certificates of study required for the respective parts, provided that the examination is not completed before the expiration of five years from the date of passing the Preliminary Examination.

The fees for admission to the Third or Final Examination are as follows. For the whole examination £21. Part I. For re-examination in Medicine, including Medical Anatomy, Pathology, Therapeutics, Forensic Medicine, and Public Health £5 5s., for re-examination in Practical Pharmacy (if taken at this examination) £2 2s. Part II. For re-examination in Surgery, including Pathology, Surgical Anatomy, and the use of Surgical Appliances £5 5s. Part III. For re-examination in Midwifery and Diseases Peculiar to Women, £3 3s.

A candidate referred on the Third or Final Examination will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection and will be required before being admitted to re-examination, to produce a certificate, in regard to Medicine and Surgery, of having attended the Medical and Surgical Practice or the Medical or Surgical Practice, as the case may be during the period of his reference, and in regard to Midwifery and Diseases Peculiar to Women a certificate of having received subsequently to the date of his reference, not less than three months instruction in that subject by a recognised teacher.

Students of recognised universities in England, Scotland, and Ireland, who have passed examinations for a degree in Medicine at their universities in the subjects of the First and Second Examinations of the Examining Board may enter for the Final Examination at the expiration of two years from the date of passing in Anatomy and Physiology on production of the required certificates.

Members of certain recognised Indian Colonial and Foreign universities who have passed examinations for the

Degree of Doctor or Bachelor of Medicine or Surgery in the subjects of the First and Second Examinations of the Examining Board may present themselves for the Final Examination under special conditions which can be ascertained on application to the Secretary

ROYAL COLLEGE OF PHYSICIANS OF LONDON THE MEMBERSHIP AND FELLOWSHIP

In addition to the diplomas granted by the English Conjoint Board, the Royal College of Physicians of London and the Royal College of Surgeons of England grant honour diplomas, which no longer give the right to practise professionally if held separately. The Royal College of Physicians of London has two such diplomas, the *Fellowship* which is a purely honorary distinction and the *Membership* which is obtained by examination.

Membership—Every candidate for the Membership of the College must furnish proof of having attained the age of 25 years. Candidates must not be engaged in trade, dispense medicine, make any arrangement with a chemist or any other person for the supply of medicine, or practise medicine or surgery in partnership, by deed or otherwise. Any candidate being already registered or having passed a qualifying examination in accordance with the Medical Act of 1886 who has obtained the degree of Doctor or Bachelor of Medicine at a University in the United Kingdom, in India, or a British colony, or who has obtained a foreign qualification entitling him or her to practise medicine or surgery in the country where such qualification has been conferred, wherein the courses of study and the examinations to be undergone previously to graduation have been adjudged by the Censors' Board to be satisfactory will (if the Censors think fit) be admitted to the Pass Examination. The nature and extent of this examination will, in the case of each candidate, be determined by the Censors' Board. All other candidates must produce proof of having passed the examinations required for the Licence of the College. The examination is directed partly to pathology and partly to the practice of medicine and may be modified in circumstances to be ascertained by application to the Registrar. For example, candidates under 40 years of age are examined in an ancient and a modern language, a test from which their seniors are exempt. The fee for admission as a Member of the College is 40 guineas, except when the candidate for Membership is a Licentiate of the College, in which case the fee already paid for the Licence shall be deducted from the 40 guineas. The fee for the examination is £3 6s.

Fellowship—The *Fellows* are selected annually from the ranks of the *Members* by the Council of the College.

ROYAL COLLEGE OF SURGEONS OF ENGLAND THE FELLOWSHIP

The Royal College of Surgeons of England confers its diploma of Fellow upon a few distinguished persons in an honorary capacity. Two Members of long standing may also be elected to the Fellowship annually. But the bulk of the *Fellows* obtain the diploma as the result of examination.

Fellowship—The examination for the Fellowship is divided into two parts—viz, the First Examination and the Second Examination. The subjects of the First Examination are Anatomy and Physiology, and the questions on these subjects may require an elementary acquaintance with Comparative Anatomy and Physiology. The examination is partly written and partly *visà voce*. The subjects of the Second Examination are Surgery including Surgical Anatomy and Pathology. The examination is partly written and partly *visà voce* and includes the examination of patients and the performance of operations on the dead body. The examinations are held during the months of May and November of each year.

The fees for examination are—First Examination, each admission, 5 guineas. Second Examination, each admission, 12 guineas. Of such examination fees 17 guineas will be reckoned as part of the fee payable upon admission to the Fellowship. The fee to be paid upon admission to the Fellowship is 30 guineas, except when the candidate is a Member of the College, in which case the fee is 23 guineas. A Member of the College is admissible to the First Examination at any time after receiving his Diploma of Membership. A candidate who is not a member of the College is

admissible to the first Professional Examination for the Fellowship on the production of evidence of having passed the First and Second Examinations of the Examining Board in England by the Royal College of Physicians of London and the Royal College of Surgeons of England (or, if a member of a University recognised by the College for the purpose, of having passed the Examinations in his University equivalent to the First and Second Examinations of the Board) and on the production of certificates of attendance upon certain courses of study described in the Regulations.

A Member of the College is admissible to the Second Examination at any time after having passed the First Examination, on producing satisfactory evidence of having been engaged not less than six years in the study (or study and practice) of the profession.

A candidate who is not a Member of the College must possess the registrable surgical and medical degrees of universities recognised by the Council and must have been engaged in the study (or study and practice) of the profession for not less than four years subsequent to the date of obtaining the recognised qualification, one year of which shall have been spent in attendance on the Surgical Practice of a recognised hospital. The diploma of Fellow is not conferred upon successful candidates until they have attained the age of 25 years.

The Regulations may be obtained on application to the Director of Examinations Examination Hall, Queen square, Bloomsbury, London, W.C.

SOCIETY OF APOTHECARIES OF LONDON

There are two examinations—Primary and Final. The Final examination is divided into Section I and Section II. The Primary examination is held quarterly. Final examinations are held monthly. No examinations are held in the month of September.

The Primary examination consists of two parts. Part I. Elementary Biology, Chemistry, Chemical Physics, including the Elementary Mechanics of Solids and Fluids, Heat, Light and Electricity, Practical Chemistry, and Maternal Medicine and Pharmacy. Part II includes Anatomy, Physiology, and Histology. This examination cannot be passed before the completion of twelve months' Practical Anatomy with Demonstrations, and these subjects cannot be taken separately except in the event of the candidate having previously passed in one. A schedule for the Primary examination, to be obtained of the Secretary, must be signed by the Dean of the Medical School or other authority. Section I of the Final examination consists of three parts. Part I includes the Principles and Practice of Surgery, Surgical Pathology, and Surgical Anatomy, Operative Manipulation, Instruments and Appliances. Part II includes the Principles and Practice of Medicine, Pharmacology, Pathology and Morbid Histology, Forensic Medicine, Hygiene, Theory and Practice of Vaccination, and Mental Diseases. Part III includes Midwifery, and Diseases of New-born Children and the Gynaecology, and Diseases of the Female Sex. Section II. Use of Obstetric Instruments and Appliances. Section I of the Final examination cannot be passed before the expiration of 45 months from the date of commencement of medical study, during which time not less than three winter sessions and two summer sessions must have been passed at one or more of the medical schools connected with a general hospital recognised by the Society. Section II of the Final examination consists of two Parts. Part I. Clinical Surgery, Part II. Clinical Medicine and Medical Anatomy. Section II cannot be passed before the end of the fifth year.

The course of study for the Primary examination is as follows—Elementary Biology not less than three months, Chemistry and Chemical Physics six months, Practical Chemistry, three months, Pharmacy and Dispensing, three months, Anatomy six months, Physiology six months, Histology with Demonstrations, three months. The study of these subjects must be pursued at a Medical School recognised by the Society. Instruction in Pharmacy and Dispensing must be given by a registered medical practitioner or by a member of the Pharmaceutical Society by examination, or in a public hospital, infirmary, or dispensary.

The course of study for the *Final examination Section I*, includes attendance on the Surgical and Medical Practice (with Post-mortem Examinations) at a hospital connected with a medical school for a period of one winter and one summer session, lectures on the Principles and Practice of Surgery, six months, Practical Surgery, three months, Clinical Surgical Lectures nine months, Dressership six months, Performance of Surgical Operations on the Dead Body, lectures on Principles and Practice of Medicine, six months, Pathology, three months, Clinical Medical Lectures, nine months, Clinical Clerkship, six months, Forensic Medicine, Hygiene and Insanity, three months, Midwifery and Gynaecology three months, Clinical Instruction in the same three months, a course of Practical Midwifery, attendance on 20 Midwifery cases. The course of medical study must extend over the above-mentioned period of 45 months and the offices of dresser or clinical clerk must be held at a hospital or other institution recognised by the Society.

The course of study for the *Final examination, Section II*, includes either attendance on the Practice of Medicine and Surgery at a hospital or other institution recognised by the Society for a further period of 12 months, or six months as above and six months as a pupil of a registered practitioner holding a public medical or surgical appointment or attendance at two special hospitals for six months (three months at each hospital) and for six months at a general hospital, all such hospitals to be recognised by the Society. Evidence shall also be given of practical instruction in Infectious Diseases and in Mental Diseases (at a lunatic asylum or in the wards of an institution containing a special ward set apart for the treatment of mental diseases) and in any two of the following subjects: Ophthalmic Surgery, Laryngology with Rhinology and Otology, Dermatology, and Diseases of Children. No candidate is eligible for the Final examination who has not completed the curriculum prescribed by the Society in evidence of which a schedule to be obtained of the Secretary must be produced, signed by the Dean of the Medical School or other authority. Prior to Section II of the Final examination the candidate must produce certificates: (1) of being 21 years of age, (2) of moral character, (3) of the course of medical study, (4) of proficiency in vaccination signed by a teacher authorised by the Local Government Board, and (5) of instruction in the administration of anaesthetics. Candidates intending to present themselves for examination are required to give 14 days notice. A form for this purpose will be sent on application.

Licentiatees are eligible for the Membership of the Society of Apothecaries. Particulars may be obtained on application to the clerk.

The fee for the Licence is 20 guineas. Female candidates are admitted to examinations. The examination offices are open from 10 A.M. to 4 P.M. on Saturdays from 10 A.M. to 1 P.M. All letters should be addressed to the Secretary, Court of Examiners, Society of Apothecaries of London, Blackfriars E.C.

METROPOLITAN ANCILLARY SCHOOLS AND HOSPITALS AFFORDING FACILITIES FOR CLINICAL OBSERVATION

The institutions which follow provide to the medical student and medical graduate facilities for different forms of instruction and clinical observation. In each case further information can be obtained from the secretary of the hospital.

THE SPANISH HOSPITAL SOCIETY possesses two hospitals—the *Dreadnought* Hospital at Greenwich, 250 beds, and the Branch Hospital in the Royal Victoria and Albert Docks, E., 50 beds. It has also two Dispensaries—one in the East India Dock road and the other at Gravesend—from which the patients are transferred to the hospitals. The London School of Clinical Medicine is attached to the *Dreadnought* Hospital and the medical staff is as follows—Physicians: Sir Dyce Duckworth, Bart., Dr F. Taylor, Sir J. Ross, Bradford K.C.V.G., Dr Guthrie Rankin and Dr S. Russell Wells. Surgeons: Mr W. Turner, Mr L. H. McGavin, Mr F. Rock Carling and Mr C. C. Choyce. Ophthalmic Surgeon: Mr L. V. Cargill. Surgeon for Diseases of the Skin: Sir Malcolm Morris, K.C.V.O. Surgeon for Diseases of the Throat, Nose, and Ear: Mr Richard Lake. Neurologist:

Dr Gordon Holmes. Physician in Charge of the Electrical Department. Colonel Collis Barry. Assistant Physicians: Dr C. E. Sundell, Dr H. B. Carhill, and Dr H. R. Prentice. Assistant Surgeons: Mr P. Cole, Mr C. Rowntree, and Mr E. G. Stanley. Assistant Physician for Diseases of the Skin: Dr H. MacCormac. Assistant Ophthalmic Surgeon: Mr R. Bickerton. Assistant Surgeon for Diseases of the Throat, Nose, and Ear: Mr G. N. Biggs. Director of Pathology: Professor R. Tanner Hewlett. Anaesthetists: Dr E. W. Gandy and Dr W. E. Robinson. Dean: Mr C. C. Choyce. Medical Superintendent: Dr R. S. Lawson. The London School of Tropical Medicine is attached to the Albert Dock Hospital of the Society and the medical staff is as follows: Physicians: Sir Patrick Manson G.C.M.G., Professor F. M. Sandwith, Dr O. W. Daniels and Dr G. C. Low. Surgeon: Mr J. Cantlie and Colonel J. J. Pratt. Ophthalmic Surgeon: Mr L. V. Cargill. Dental Surgeon: Mr T. H. Vaughan. Director: Mr H. B. Newham. Medical Officer East India Dock road Dispensary: Mr W. H. F. Oxley. Surgeon Gravesend Dispensary: Mr O. E. Robbs. Secretary: Mr P. J. Michelli, C.M.G.

WEST LONDON HOSPITAL, Hammersmith, W.—This hospital has 160 beds, all of which are constantly in use. 2714 in patients and 34,754 out-patients whose attendances numbered 147,687, were treated last year. Attached to the hospital is the West London Post-Graduate College. The practice of the hospital is reserved exclusively for qualified men, no junior students being admitted. Instruction is given in the medical and surgical out-patient rooms and demonstrations are given in the wards every morning and afternoon. Lectures and demonstrations are in abeyance during the war. Special Classes are held in Diseases of the Throat and Nose, Skin, and Eye and in Gynaecology, Medical Electricity, Operative Surgery, Bacteriology, Anaesthetics, Intestinal Surgery, Medical and Surgical Diseases of Children, Blood and Urine, Clinical Microscopy, Tropical Medicine, Cystoscopy, Venereal Diseases, and Operative Ophthalmology. The accommodation for post-graduates consists of a large lecture room, together with reading, writing, and class rooms, &c. The hospital has a fully equipped pathological laboratory at which instruction is given in elementary bacteriology, a class being held every month. The fees for hospital practice including lectures, are £6 6s. for three months or £15 15s. for one year. The certificate of the hospital is accepted by the Admiralty War Office, Colonial Office, and India Office in cases of study leave. Further information can be obtained on application to the Dean, Mr Donald Armour, or Vice Dean, Mr Bishop Harman, at the hospital. Physicians: Dr A. P. Beddard, Dr E. A. Saunders, and Dr H. Pritchard. Physician for Diseases of Women: Dr Drummond Robinson. Assistant Physician for Diseases of Women: Dr H. J. F. Simson. Surgeons: Mr A. Baldwin, Mr Donald Armour, and Mr J. Pardoe. Surgeon for Diseases of the Eye: Mr Bishop Harman. Assistant Surgeon for Diseases of the Eye: Mr H. P. Gibb. Assistant Physicians: Dr Grainger Stewart, Dr J. M. Burnford, and Dr Sydney A. Owen. Assistant Surgeons: Mr O. L. Addison, Mr H. Tyrrell Gray, and Mr H. S. Souttar. Surgeon-Dentist: Mr H. Lloyd Williams. Physician in charge of Throat and Nose and Aural Department: Dr H. J. Banks Davis. Physician in charge of Children's Department: Dr E. A. Saunders. Surgeon in charge of Orthopaedic Department: Mr A. Baldwin. Pathologist: Dr R. R. Elworthy. Dermatologist: Dr G. Pernet. Administrators of Anaesthetics: Dr G. P. Shuter, Dr H. M. Page, and Dr W. E. Robinson. Assistant Anaesthetists: Mr G. R. Phillips, Mr J. H. Newmarch, and Mr R. W. Ironside. Electrical Department: Mr E. D. MacDougal. X-Ray Department: Dr R. Morton. Medical Registrar: Dr A. J. Scott. Pinchin. Surgical Registrar: Mr S. G. MacDonald. Secretary of the Hospital: Mr A. Betteridge.

GREAT NORTHERN CENTRAL HOSPITAL, Holloway road, N.—This hospital is recognised by the Examining Board in England of the Royal Colleges of Physicians and Surgeons as a place of study during the fifth year of the medical curriculum. Besides the Honorary Staff Officer, two resident House Physicians, and three resident House Surgeons. The hospital contains 325 beds (including emergency beds), which are fully occupied.

There is also a ward for children under five years of age. The large rectangular and circular wards, each of which contains 24 beds, the observation wards, the two operation theatres, general and special out-patient and pathological departments, are specially designed with a view of offering the greatest facilities for clinical work. There is also a well appointed electrical department. The Pathological Department has been extended and is under the control of a Director of Clinical Pathology. The Reckitt Convalescent Home at Oulton on Sea belongs to the hospital. It contains 40 beds. Medical practitioners are cordially invited to see the general and special practice of the hospital. Demonstrations are given daily in the wards and out-patient departments. Clinical assistants (qualified), clinical clerks, and pathological clerks are appointed in the general and special departments and may receive certificates at the end of their terms of office. Further particulars from the Secretary of the Medical Committee at the Hospital. Consulting Physicians Sir R. W. Burnet and Dr E. C. Beale. Consulting Surgeon Mr. Peyton T. B. Beale. Consulting Ophthalmic Surgeon Mr. A. Stanford. Morton. Consulting Radiologist Dr. Robert Knox. Physicians Dr. A. Morrison, Dr. Symes Thompson, Dr. Hinds Howell, Dr. F. W. Price, Dr. H. L. Tidy, and Dr. E. Bellingham. Smith. Obstetric Physicians Dr. G. F. Blacker and Dr. Outhbert Lockyer. Physician for Skin Dr. Henry C. Semon. Surgeons Mr. G. B. M. White, Mr. Arthur Edmunds, Mr. C. O. Choyce, Mr. Gwynne Williams and Mr. Barrington Ward. Ophthalmic Surgeon Mr. A. H. Payan. Dawney. Throat and Ear Surgeons Mr. J. Gay French and Mr. H. T. Mant. Dental Surgeon Mr. C. F. Peyton. Baly. Medical Officers in charge of Electrical Department Dr. Robert Knox and Dr. John Morison. Director of Clinical Pathology Dr. Ernest H. Shaw.

PRINCE OF WALES'S GENERAL HOSPITAL, Tottenham, N.—This general hospital is in the midst of a densely populated neighbourhood of more than half a million inhabitants. It contains medical, surgical, gynaecological, and children's wards, having in all 125 beds. There are special departments for gynaecological cases, diseases of the eye, ear, throat, and nose, skin diseases, medical electricity, radiography, and dentistry. Operations are performed every afternoon of the week (except Saturday) at 2.30 p.m. Clinical instruction, laboratory classes, and lectures are given in the wards and out-patient departments, laboratories, and lecture hall in connexion with the North East London Post-Graduate College attached. There are four Resident Medical Officers, and Clinical Assistants are appointed under certain conditions. Further particulars in regard to the hospital may be obtained from Mr. H. W. Carson, Secretary to the Medical Committee, 111, Harley-street, W., or from Dr. A. J. Whiting, Dean of the North-East London Post-Graduate College 19A, Cavendish square, W. Consulting Physicians Sir James Reid, Bart., and Dr. Percy Kidd. Consulting Surgeon Mr. Walter Edmunds. Physicians Dr. R. Murray Leslie, Dr. G. P. Chappel, and Dr. A. J. Whiting. Assistant Physicians Dr. A. G. Auld and Dr. T. R. Whigham. Surgeons Mr. H. W. Carson and Mr. J. Howell Evans. Assistant Surgeon Mr. E. Gillespie. Gynaecologist Dr. A. E. Giles. Assistant Gynaecologist Dr. J. Bright Banister. Surgeon to Ear, Nose, and Throat Department Mr. H. D. Gillies. Ophthalmic Surgeon Mr. R. P. Brooks. Assistant Ophthalmic Surgeon Mr. E. A. Dorrell. Physician for Skin Diseases Dr. H. W. Barber. Physician to Electrical Department Dr. Metcalfe. Anaesthetists Dr. C. F. Hadfield, Dr. W. E. Hills, and Dr. Shannon. Bacteriologist Mr. Benians. Secretary Mr. F. W. Drewett.

LONDON TEMPERANCE HOSPITAL Hampstead road, N.W. (Established 1873).—Consulting Physician Dr. Fenwick. Physicians Dr. Parkinson, Dr. Addinsell and Dr. Kevin Byrne. Consulting Surgeon Sir William Collins. Surgeons Mr. Arthur Evans and Mr. H. J. Paterson. Assistant Surgeons Mr. James McClure and Mr. Chad Woodward. Ophthalmic Surgeon Mr. J. Stroud. Hospital. Physician for Diseases of the Skin Dr. Sommerville. Ear, Nose, and Throat Surgeon Mr. Harold L. Whale. Medical Officer in charge of Electrical Department Dr. Herbert Rhodes. Dental Surgeon Mr. A. Alexander. The hospital contains 116 beds. The in-patients in 1915 were 1233, and the out-patients and casualties numbered 19,546.

new cases. The medical and surgical practice of the hospital is open to students and practitioners. Operations Mondays at 2 P.M., Tuesdays, Wednesdays, and Fridays at 9 A.M.

HAMPSTEAD GENERAL AND NORTH WEST LONDON HOSPITAL.—The Hampstead General Hospital (Haverstock Hill) and the North West London Hospital (formerly at Kentish Town) have been amalgamated since 1907. The Hampstead General Hospital (137 beds—viz., 118 free, 6 isolation, &c., and 13 paying or contributory, out of these, 53 beds are reserved for soldiers) accommodates the in-patients from the districts hitherto served by both hospitals. The out-patients, with the exception of Hampstead casualty and emergency cases, attend exclusively at the Out-patients Department Bayham street, Camden Town, where there are usually two Resident Medical Officers as well as resident nurses. Physicians to In-patients Dr. G. A. Sutherland and Dr. C. O. Hawthorne. Surgeons to In-patients Mr. J. Jackson Clarke and Mr. J. W. Thomson Walker. Physicians to Out-patients Dr. A. Manuel, Dr. F. G. Crookshank, and Dr. A. J. Scott Pinchin. Surgeons to Out-patients Mr. G. E. Waugh, Mr. Sidney A. Boyd, and Mr. Chad Woodward. Physician for Diseases of the Skin Dr. S. E. Dore. Gynaecologist Mr. Bryden Glendinning. Ophthalmic Surgeon to In-patients Sir William J. Collins. Ophthalmic Surgeon to Out-patients Mr. T. W. Letchworth. Throat and Ear Mr. H. L. Whale. Dental Surgeon Mr. O. H. J. Acret. Anaesthetists Dr. G. A. H. Barton, Mr. Hedley O. Visick, and Dr. Fraser. Pathologist Dr. Herbert W. Perkins. Further particulars from the secretary at the hospital (Haverstock Hill, N.W.).

NEW HOSPITAL FOR WOMEN, 144 Enston road, N.W.—Physicians for In-patients Miss Macdonald, M.B., and Mrs. Flemming, M.D. Surgeons for In-patients Miss Aldrich-Blake, M.D., M.S., and Miss Chadburn, M.D., B.S. Physicians and Surgeons for Out-patients Miss Anderson, M.D., B.S. Miss Woodcock, M.D., B.S. Miss Bolton, M.D., B.S., and Miss Hamilton, M.D., B.S. Children's Department Miss Hamilton, M.D., B.S. Ophthalmic Surgeon Miss Sheppard, M.B. Senior Assistants for Out-patients Miss Mildred Burgess, M.D., Mrs. Sinclair, M.D., and Miss M. Paine, M.D. Obstetricians Miss Chadburn, M.D., B.S. Miss Turnbull, M.D., and Miss Davies Colley, M.D., F.R.C.S. Anaesthetists Miss Browne, L.S.A., and Miss Payne, M.D. A considerable number of the students work in the New Hospital under the visiting staff, and in return for much valued clinical teaching they perform the duties assigned to students in the wards of a general hospital. Secretary Miss Imogen H. Murphy.

THE SOUTH LONDON HOSPITAL FOR WOMEN 103 South Side, Olapham Common, S.W., Out-patient Department 88-90 Newington Causeway, S.E.—This hospital, officered entirely by medical women, is a general hospital for women girls, and small children of both sexes, and provides accommodation for 80 patients. All diseases are treated with the exception of acute infectious fevers and mental disease. There are Ophthalmic, X Ray, and Pathological Departments. The provision of additional facilities for post-graduate training for medical women is one of the special objects of the hospital. At the Out-patient Department in Newington Causeway 5765 new cases were treated during the past year, the total number of out-patient attendances amounting to 21,371. Clinical assistants (qualified women only) are from time to time appointed in the Out-patient Department. Consulting Surgeon Mrs. Scharlieb. Physicians Dr. Fraser and Dr. Pulteney. Assistant Physicians Dr. Thackrah and Dr. Pickard. Surgeons Miss Chadburn and Miss Turnbull. Assistant Surgeons Miss Davies Colley, Miss Huxley, and Miss MacKenzie. Ophthalmic Surgeon Miss Roberts. Radiographer Miss Bernard. Secretary Miss M. E. Ridler.

No fees are charged. The physicians treating out-patients are Dr Harry Campbell, Dr Frederick S Palmer, Dr Eric D Macnamara Dr Purves Stewart, Dr Frederick Golla, Dr H Ridley Prentice, and Dr Hildred Carill Dr Dundas Grant demonstrates on throat and ear cases.

The Savill Prize and Medal is awarded to the student who makes the best *virâ voce* examination and presents the best thesis after attending at least 25 demonstrations.

Owing to the war, demonstrations by the staff have been discontinued for the present.

BETHLEM ROYAL HOSPITAL.—This hospital is open for the admission of two Resident House Physicians who have recently obtained their diplomas to practise Medicine and Surgery. They are permitted to reside in the hospital for a term generally not exceeding six months commencing May 1st and Nov 1st, and are provided with apartments, complete board, attendance laundry, and a salary at the rate of £100 per annum. They are under the direction of the Medical Superintendent and are elected by the Committee from candidates whose testimonials appear to be most satisfactory. The students of certain specified London Medical Schools receive Clinical Instruction in the wards of the hospital and qualified practitioners and other students may attend for a period of three months on payment of a fee. Medical Superintendent Dr Porter Phillips Senior Assistant Physician Dr Ralph Brown Junior Assistant Physician Dr H L McCarthy

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton (333 beds).—The hospital contains 333 beds. The Sanatorium at Frimley contains 100 beds and 50 beds for paying patients. Six House Physicians reside in the hospital for a term of six months, their duties include attendance in the out-patient department. Pupils are admitted to the practice of the hospital terms, £1 1s for one month, three months, £2 2s, perpetual, £5 5s. Clinical Demonstrations are given throughout the year by members of the medical staff. Lectures have been suspended for the duration of the war. Clinical Assistants are appointed to the Assistant Physicians in the out-patient department and Clinical Clerks to the Physicians in the wards. The hospital has been recognised by the Conjoint Board for England as a place where six months of the fifth year may be spent in clinical work. The medical practice of the hospital is also recognised by the University of London the Apothecaries Society and the Army and Navy and Indian Medical Boards. Consulting Physicians Sir Richard Douglas Powell Dr F T Roberts Dr J M Bruce Dr T H Green Dr T D Acland Sir J K Fowler Dr P Kidd and Dr H W G Mackenzie Physicians Dr F J Wethered Dr P Horton Smith Hartley, Dr J J Perkins, Dr H Batty Shaw Dr W O Bosanquet, and Dr R A Young Assistant Physicians Dr C Wall, Dr W J Fenton Dr A J Jex Blake, Dr Burrell and Dr Gosse Consulting Surgeon Sir R J Godlee Surgeon Vacancy Dental Surgeon Mr A E Ironside Surgeon to Throat and Ear Department Dr Dundas Grant Superintendent of Laboratories Dr A O Inman X Ray Department Dr S Melville Resident Medical Officer Dr Jones Dean of the Medical School Dr Cecil Wall

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST Victoria Park, E.—During the past year 947 inpatients have been treated in the wards and the large number of 47 389 cases since the opening of the wards in 1855. The number of out-patients treated during 1915 was 7928 and 820 009 since the commencement of the institution in 1848. Information as to medical instruction can be obtained on application to the Secretary of the Medical Committee at the hospital. Consulting Physicians Dr Vincent D Harris Sir William S Church Bart. Dr E Clifford Beale, Dr Harrington Sainsbury and Sir Hugh Beaver Bart. ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City road (80 beds)—This hospital provides accommodation for 80 in-patients. Expenditure for 1915 £8100, income £7000. The attendance of out-patients averages 19,000 annually. Consulting Physicians Dr Horace Dobell, Dr P J Hensley Professor D W Finlay, Sir Wm Osler, Bart and Dr W H White. Physicians Dr A Davies, Dr J Calvert, Dr M Leslie, Dr J H Drysdale, Dr A G Phear, and Dr H E Symes Thompson. Assistant Physicians Dr Barty King and Dr Stott. Consulting Surgeons Sir A Pearce Gould and Mr W Turner. Surgeon Mr Arthur Evans. Anaesthetist Mr H Drinkwater. Clinical Pathologist Dr Carnegie-Dickson. Dental Surgeon Mr G Thomson. Radiographers Dr A C Jordan and Dr Mowat. Cardiologist Dr A W Stott. Laryngologist Dr Mant. Medical Registrar Dr Comyn. Resident Medical Superintendent Colonel Murray, I M S. Secretary Mr A. T. Mays.

THE MOUNT VERNON HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, NORTHWOOD, CENTRAL OUT-PATIENT DEPARTMENT, Fitzroy square, W.—The hospital contains 110 beds. Number of in-patients 498, out-patients, 2159. Resident Medical Staff. Clinical Demonstrations are given by the Visiting Medical Staff at the hospital at Northwood. Clinical assistants are appointed to physicians in the wards and in the out-patient department. Physicians Dr George Johnston, Dr T N Kelynaek, Dr T D Lister, Dr Alexander Morrison, Dr Halls Dally, Dr Basil Price, and Dr Reeve. Surgeon Mr D C L Fitzwilliams. Surgeon Laryngologist Mr J C Porter. Radiographer. Mr J S Part. Secretary Mr W J Morton. Offices 7 Fitzroy square, W.

QUEEN CHARLOTTE'S LYING-IN HOSPITAL AND MIDWIFERY TRAINING SCHOOL, Marylebone road, N W.—This hospital receives about 1800 patients annually, besides having a large out-patient department. Medical pupils are received at all times of the year. Pupils have unusual opportunities of seeing obstetric complications and operative midwifery, on account of the very large number of primiparous cases—nearly one half of the total admissions. Clinical instruction is given on the more important cases which present themselves. Certificates of attendance at this hospital are recognised by all the Universities, Colleges, and licensing bodies. Pupil midwives and monthly nurses are received and specially trained. A Residential College provides accommodation for five men at a time, students and qualified practitioners and is opposite the hospital, with which it is in telephonic communication. Arrangements have been made for Medical Students to receive the preliminary instruction in Practical Midwifery recommended by the General Medical Council. For further particulars application should be made to Mr Arthur Watts Secretary at the hospital. Consulting Physicians Dr George B Brodie Dr W S A Griffith, Dr W J Gow, and Dr T W Eden. Physicians to In-patients Dr A. F Stabb Dr O Hubert-Roberts Dr Thomas G Stevens, and Dr O White. Physicians to Out-patients Dr J B Baister and Dr Wm Gilliatt. Women students are received, and the Resident Medical Officers are women at present.

THE HOSPITAL FOR WOMEN Soho-square, W.—In connexion with the out-patient department there has been for some years a well organised Clinical Department. Gentlemen are appointed to act as clinical assistants to the gynecologists to out-patients. The appointments are open to qualified medical men and women. Every facility is afforded them by the gynecologists in the out-patient department of obtaining experience in diagnosis and treatment and the practical use of instruments. Fee for one month £2 2s, for each subsequent month the same. The hospital contains 67 beds. In the out-patient department there were over 4000 new cases during the past year the total number of out-patient attendances being 14 500. This large number affords exceptional opportunities for examining and studying most of the varieties of the diseases of women. Applications should be made to the Secretary. Gynecologists Dr Bedford Fenwick, Dr James Oliver Dr T G Stevens Dr H J F Simson and Dr Trevor B Davies. Surgeons Mr D Drew and Mr L H McGavin.

Surgeon Dentist Mr W J May. Anaesthetists Mr Ogle, Dr M Horne, Dr Pinto-Leite, and Dr J Mackenzie. Pathologist and Registrar Dr Trevor Davies. Secretary Alfred Hayward.

SAMARITAN FREE HOSPITAL FOR WOMEN, Marylebone road, N W.—Qualified practitioners are admitted as clinical assistants to both the in and out-patient departments. Demonstrations are given daily in both departments. Fees, payable in advance, are £3 3s for three months. Particulars may be obtained on application to the Secretary at the hospital. There are 67 beds. Consulting Staff A Routh, Dr W A Meredith Dr A H G Doran, and A C Butler Smythe. Physician Dr H W G Macken. Surgeons to In-patients Mr J D Malcolm, Dr C Roberts, Mr F J McCann, Mr O Keep and Mr O Lock. Surgeons to Out-patients Mr J A Willett Mr G F Smith, Mr C White Mr D W Roy and Mr W Gill. Registrar Mr A W Bourne. Anaesthetists Mr G Jones Mr H Robinson Mr R W Ironside Mr E Drinkwater, and Mrs M Brady. Resident Medical Officer Miss A Doherty. Secretary Mr G H Hawkins.

EAST LONDON HOSPITAL FOR CHILDREN AND DISPENSARY FOR WOMEN, Glamis road, Shadwell E—The hospital maintains 128 cots, and on an average 1000 out-patients are seen daily. Clinical instruction is given by the physicians and surgeons to the hospital, which is recognised by the Conjoint Board for England as a school of medical teaching for students in the fifth year of the curriculum. All particulars may be obtained on application to the Secretary. Two clinical clerkships for qualified or unqualified students are open every three months subject to reappointment if desired. Clinical assistants (qualified men only) are from time to time appointed in the out-patient department. Any additional information may be obtained on applying to Mr W J Wilcox the Secretary, at the hospital. Physicians I E Graham Little, Dr A. M Gossage Dr Clive Rivier and Dr T Fisher. Surgeons Mr R Warren and Mr J E Adams. Assistant Physicians Dr O K Williams Dr R S Frew, and Dr G Graham. Assistant Surgeons Mr J E H Roberts and Mr C M Kennedy. Ophthalm Surgeon Mr F Juler. Pathologist Dr E A Ros. Dental Surgeon Mr E S Pierrepont. Medical Officer for the Electrical Department Dr Collis Barry. Medical Officer for the Casualty Department Dr T B Jones. Resident Medical Officer Mr H L Cronk. House Physician Mr K. S Bhat. Secretary Mr W M Wilcox.

THE HOSPITAL FOR SICK CHILDREN, Great Ormond street, W O, contains 240 beds besides 30 beds at the convalescent branch, Highgate. The hospital having been recognised by the Conjoint Board for England as a place where, under the new curriculum, six months of the fifth year may be spent in clinical work, the practice is arranged to meet this need and is open to students of both sexes who have completed four years of medical study and also to qualified medical men and women. The medical staff are recognised by the University of London as teachers in Diseases of Children. Appointments are made every three months to six medical clerkships which are open to students of the hospital. Clinical instruction is given daily by members of the visiting staff. Fees for hospital practice, one month £2 2s, three months 5 guineas, perpetual ticket, 10 guineas. Clinical Clerks, 1 guinea for three months. Ophthalmological Clerkships—Clinical Clerks are appointed once a month. Fees £1 1s for one month's attendance. Pathological Clerkships—Facilities are afforded for obtaining theoretical and practical instruction in Clinical Pathology and Bacteriology in the Pathological Laboratories. Clerks attend for about four hours daily. Fees for one month £3 3s, for two months, £5 5s, for three months £6 6s. A reduction is made in the case of those already holding tickets for general attendance at the hospital. Special Post-graduate Classes are held throughout the year particulars of which may be obtained from the Dean or Secretary. Consulting Physicians Sir Thomas Barlow Bart Dr F G Penrose and Dr A. E Garrod. Physicians Dr A F Voelcker Dr W S Colman, Dr F E Batten and Dr G F Still. Physicians to Out-patients Dr F J Poynton, Dr Robert Hutchison, Dr H. Thurstield Dr T Thompson and Dr F Langmead. Consulting Surgeons Mr John H Morgan C V O Surgeons Emeritus Surgeon Sir

THE TREATMENT OF DIABETES

Diabetifuge treatment is constituted on sound, practical, scientific lines, and yields most satisfactory results in the gradual diminution of the sugar percentage, which is in most cases of a permanent character

It has been well proven that **PEROXIDE OF MANGANESE** is one of the best producers of glycolysis, being a true oxygen carrier that readily yields some of its oxygen after absorption into the organism, and has the power of replenishing itself immediately after

BICARBONATE OF SODA is also a good oxygen carrier which has a high reputation in the treatment of Diabetes **CHLOR-HYDRO-METHYL-ARSENATE OF LITHIA** in small doses favours glycolysis both as an oxygen carrier and as an aid to assimilation

ANTI-PYRINE, URANIUM NITRATE, and **SANTONIN** also enter into the composition of **DIABETIFUGE**. These three substances are the most powerful restrainers and regulators of the glycogenic function known, and each is looked upon as a well-tried drug for the special purpose of preventing the formation of sugar

By the combination of these substances in **DIABETIFUGE**, a preparation is placed at the disposal of the Medical Profession which invariably effects a marked improvement in the condition of the diabetic patient and frequently a permanent cure

Price per box of 80 Cachets
(for one month's treatment), 7/6

NOT ADVERTISED TO THE PUBLIC.

URASEPTINE

ROGIER

1907—1916.

The Most Powerful of
Urinary Antiseptics.

Uraseptine is a granulated product entirely soluble in water, its bases being **Piperazine, Urotropine, Helmitol, Benzoates of sodium and lithium**, and containing 60 centigrams (10 grs) of active matter to each tea spoonful. Dose 2 to 6 teaspoonfuls daily. It purifies the urines, and this action is due to its three principal properties

1. IT IS A URINARY ANTISEPTIC.
2. A SOLVENT OF URIC ACID AND OF PHOSPHATES.
3. A MILD NON-TOXIC DIURETIC.

NOTE THE FOLLOWING POINTS —

1 The **Benzoic acid** and the **Benzoates** are transformed in the system into hippuric acid and consequently make the urine acid, which is necessary when the latter is alkaline and ammoniacal

2 Moreover, this acid medium is indispensable for the cleavage of the **Urotropine** (Hexamethylenetetramine), which thus furnishes a certain quantity of Formol, the bacteria destroying properties of which are well known

3 **Helmitol** (anhydro methylene, citrate of Hexamethylenetetramine) possesses not only the property of disinfecting urinary apparatus to a greater extent than Urotropine, but it also possesses sedative anæsthetic properties of utmost value in painful affections

4 Lastly, the **Piperazine** (diethylene diamine) will cause the rapid elimination of uric acid and urates in the form of soluble compounds

URASEPTINE is put up in bottles containing 3½ oz, 4/6, 12 oz, 10/6

NOT ADVERTISED TO THE PUBLIC.

Flemming Mr J. H. Fisher Mr C. D. Marshall Mr J. H. Parsons Mr C. Worth, and Mr M. L. Hepburn. Assistant Surgeons Mr A. C. Hudson Mr R. Foster Moore and Mr R. Affleck Greaves. Dental Surgeon Mr R. M. Fickling. Medical Officer to the X-ray Department Mr R. Higham Cooper. Curator and Librarian Mr F. A. Juler. Bacteriologist Mr S. H. Browning. Three Refraction Assistants. 3 Resident House Surgeons, Chief Clinical Assistants, Clinical Assistants, and Junior Assistants.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL, King William street, West Strand—The hospital contains 40 free beds. The Out-patient Department has been reconstructed and enlarged, whereby the convenience for treatment and examination has been considerably improved. Patients, who number over 15,000 annually are seen at 1 P.M., and operations are performed daily at about 2 P.M. The following are the days of attendance of the surgeons: Mr Grimsdale and Mr Brewerton, Mondays and Thursdays; Mr Rolland and Mr McMullen Tuesdays and Fridays; and Mr Cruise, Mr Viner, and Mr Hine, Wednesdays and Saturdays. The practice of the hospital is open to practitioners and students. Fees for six months, £3 3s., perpetual, £5 5s., shorter periods by arrangement. Students of the hospital are eligible for the posts of house surgeon, assistant house surgeon, pathologist, and clinical assistants. Clinical Assistants (who must be duly qualified) to the Surgical Staff are appointed twice a year for periods of six months. Secretary Mr John Hy Johnson.

ROYAL EYE HOSPITAL, St. George's circus, Southwark, S.E.—There are 40 beds and 2 cots. There were 64,446 attendances in the Out-patient Department last year, and the new patients numbered 21,949. Out-patients are seen daily 1.30 to 2.30 P.M. Surgeons: Sir William J. Collins, Mr L. V. Carpell, Mr J. Stroud, Hosford Mr E. Brooksbank James, Mr E. A. Dorrell, Dr H. Willoughby Lyle, and Mr A. D. Griffith. Physician: Dr James Stansfield Collier. Consulting Radiographer: Dr J. H. Rhodes. Pathologist: Dr Effie Gordon Brander. Dean: Mr A. D. Griffith.

CENTRAL LONDON OPHTHALMIC HOSPITAL, Judd street, St. Pancras, W.C.—This hospital, which has lately been rebuilt, has 40 beds and possesses a well equipped laboratory and every facility for clinical teaching daily. Last year there were 355 in- and 11,105 out-patients (entailing 29,206 attendances). The out-patient work begins at 1 o'clock, and operations are performed daily between 1 and 4. Consulting Physician: Sir Dyce Duckworth, Bart. Consulting Surgeons: Mr A. P. L. Wells and Mr Ernest Clarke. Surgeons: Mr Stephen Mayou, Mr J. F. Cunningham and Mr A. Levy. Assistant Surgeons: Mr F. A. Juler, Mr H. P. Gibb, and Mr M. W. B. Oliver. Physician: Dr. Charles O. Hawthorne. Pathologist: Mr F. A. Juler. Bacteriologist: Dr W. Armstrong. Radiographer: Dr B. Salmond. Dentist: Mr E. P. May. Secretary: Mr H. R. S. Druce.

HOSPITAL FOR DISEASES OF THE THROAT, Golden-square, London, W., with which is amalgamated **THE LONDON THROAT HOSPITAL, Portland road**—The hospital contains 60 beds. There is an out-patient attendance of over 50,000 yearly. Clinical instruction in the Diagnosis and Treatment of Disease is given in the out-patient department from 2 to 5 P.M., on Tuesdays and Fridays from 6.30 to 9 P.M., and Mondays at 9 A.M. Practitioners and Students are admitted to the Practice of the Hospital at a fee of 5 guineas for three months, 7 guineas for six months, or 10 guineas for a Perpetual Studentship. Each course may commence at any date. Special terms to men in actual practice who can only attend the hospital once or twice a week. Gentlemen may enter to the practice of the hospital at any time. From amongst the students Junior Clinical Assistants are selected whose duty it is to assist the member of the staff to whom they are appointed. Two Systematic Courses of Lectures are given during the Winter Session, the one before and the other after Christmas, which are free to medical men and students on presentation of their cards. A Course will also be given during May and June. A syllabus of these lectures can be obtained on application to the honorary medical secretary Mr George W. Badgerow. Consulting Staff: Mr T. Mark Howell, Dr. H. Lambert Lack, Dr. Edward Law and Mr E. B. Waggett. Advisory Staff—Physicians: Dr. A. O. Latham and Dr. C. E. Lakin. Neurologist: Dr E. F. Buzzard. Ophthalmologist: Mr W. Lang. Radiographer: Dr W. Ironside Bruce. Surgeons: Dr. J. W. Bond, Mr C. A. Parker, Mr O. Woakes, Mr G. O. Cathcart, Dr W. H. Nelson, Mr Jefferson Faulder, Mr George Badgerow, Mr. Norman Patterson, and Mr Irwin Moore. Assistant Surgeons: Mr L. Colledge, Mr F. F. Muecke and Mr G. W. Dawson. Dental Surgeon: Mr A. T. Pitts. Assistant Dental Surgeon: Mr W. G. Oliver.

CENTRAL LONDON THROAT AND EAR HOSPITAL, Gray's Inn road—In addition to the new In-patient Department and operation theatre the hospital has a very extensive out-patient department, which is open to all medical practitioners and students for the purpose of clinical demonstration and instruction during the hours of the surgeons' visits. During the past year 10,680 out-patients (involving close upon 50,000 attendances) and 688 in-patients were treated. The fee for three months' attendance is 5 guineas, for six months, 8 guineas. The post-graduate teaching consists of successive series of practical demonstrations by the members of the staff delivered twice weekly during the winter and summer sessions. They are so arranged that practitioners joining at any part of the course are enabled to complete the group of subjects. A special Operative Surgery class is held at intervals. The fee for each course is 2 guineas with daily attendance at the out-patient department during the period of the course. Details of subjects, &c., will be afforded by the Dean. Considerable attention is given to scientific work, particularly with regard to Bacteriology of the ear and respiratory passages. Operation days in patients, Monday, Tuesday, Wednesday, Thursday, and Friday, at 2 P.M., out-patients, daily at 9 A.M. Consulting Physician: Dr Parves Stewart. Consulting Surgeons: Sir Watson Cheyne, Bart., Dr Dundas Grant, and Dr Percy Jakins. Consulting Ophthalmic Surgeon: Mr Stanford Morton. Surgeons: Mr Chichele Nourse, Dr Abercrombie, Mr Stuart-Low, Dr. Andrew Wylie, Dr Atkinson, and Dr McKenzie. Assistant Surgeon: Mr H. Kisch. Tuberculosis Department: Mr John MacKeith. Pathologist: Dr Wyatt Wingrave. Dental Surgeons: Mr Whishaw Wallis and Mr Henning James. Anaesthetists: Dr Beresford Kingsford, Dr Mortimer, and Dr Crampton. Assistant Anaesthetist: Dr Leshe Rawes. In addition the following appointments are open to qualified members of the profession—Six Registrars, tenable for twelve months, and sixteen Clinical Assistants tenable for three or six months. Secretary: Mr Richard Kershaw.

THE METROPOLITAN EAR, NOSE, AND THROAT HOSPITAL (1838) (unincorporated)—The hospital was founded in 1838, and is situated in Fitzroy square. The Out-patient Department is opened daily at 2.30 P.M. to all medical practitioners and senior students for acquiring clinical instruction and technical knowledge. Operations upon in-patients are performed on Tuesdays, Wednesdays, Thursdays and Fridays at 10 A.M. Fee for one month's attendance at the hospital £1 1s., and for three months £2 2s. During the forthcoming session practical demonstrations will be given by members of the staff on the diagnosis and treatment of diseases of the ear and respiratory passages. Each course may commence at any time. Clinical Assistants are appointed as vacancies occur, and have responsible duties. Consulting Surgeon: Mr J. Pickett. Surgeons: Mr H. Pegler, Mr F. Spicer, Mr W. J. Horne, Mr J. C. Potter, and Mr. H. Buckland Jones. Anaesthetists: Mr C. Looseley, Mrs. Brady and Mr C. T. W. Hirsch. Pathologist: Mr A. B. Leatham. Dentist: Mr J. A. Bowes.

ROYAL EAR HOSPITAL, Dean street, Soho (Founded 1816)—Courses of instruction of a practical character in Diseases of the Ear and Nose are given by the members of the staff throughout the year. Clinical assistants are also appointed. Students may join at any time. For information address the Honorary Secretary of the Medical Board Royal Ear Hospital, Dean street Soho. Surgeons: Mr N. Anaesthetist Mr J D Mortimer. Physician Electro-Therapeutic Department Dr Charles P. Pathologist Mr A Fleming. Dental Surgeon Mr S Lafitte. House Surgeon at the Female Hospital Dr V S Bonard. House Surgeon at Male Hospital and Out-patients' Department Mr S Chittopadhyay. Secretary Henry J Eason. Head office 233 Harrow road W.

ENGLISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS

Under this heading we include all the hospitals which are recognised by the English Portal Colleges for a part of the required attendance on medical and surgical practice for medical clerkships and surgical dressships. The list includes nearly every hospital of a general character in the country having more than 150 beds though occasionally a large hospital is admitted because equally good opportunities are afforded to students at other institutions in its neighbourhood while a small hospital may be included because no such facilities for study are present elsewhere. The list is arranged alphabetically as to the town where the hospital is located.

BATH ROYAL UNITED HOSPITAL. Bath.—This hospital contains 120 beds and possesses a fine library. Consulting Physician Dr A. E. W. Fox. Consulting Surgeon Mr R. J. H. Scott. Physicians Dr G. A.

Bannat-ne, Dr T W Smith and Dr E J Cave. Assistant Physicians Dr G E Bowker Dr L H. Walsh and Dr R Waterhouse. Surgeons Mr H G Terry Mr F. Lacey, and Mr F Fraser. Assistant Surgeons Mr W S Melsome, Mr A. L. Fuller, and Mr W G Mumford. Physician to Electrical Department Dr P King. Assistant Physician to Electrical Department Dr G E Bowker. Pathologist and Curator of Museum Dr R Waterhouse. Anaesthetist Mr A. de V. Blathway. Assistant Anaesthetist Dr Ray Edridge. Dental Surgeons Mr W J Royal and Mr S Carter. Secretary Mr J M. Sheppard.

BEDFORD COUNTY HOSPITAL. Bedford.—This hospital has 100 beds with X Ray and Pathological Departments. Consulting Physician Dr G P Goldsmith. Consulting Surgeons Mr E C Sharpin and Mr R. H. Kinsey. Physicians Dr R. Coombs and Dr W Phillips. Surgeons Mr W Gifford Nash and Mr Henry Skelding. Ophthalmic Surgeon Dr H Goldsmith. Assistant Physicians Dr A. C. Perram and Dr G T Burs. Assistant Surgeons Dr S J Ross and Mr Walter Sharpin. Dental Surgeon Mr F W Williams. House Surgeon (Vacant). House Physician Mr S N Kaul. Secretary Mr Beauchamp Wadmore.

BRADFORD ROYAL INFIRMARY. Bradford.—This hospital contains 210 beds. The maternal passing through the Surgical wards consists of major operations chiefly abdominal, and gynaecological work, and affords excellent facilities for either students or post-graduates. Plans for a new hospital of 352 beds have been adopted, and the building operations will be commenced as soon as the funds in hand will allow. Consulting Physicians Dr Herbert C Major Dr David Goyder Dr Richard Honeyburne, and Mr Thomas Wilmot. Physicians Dr Henry J Campbell Dr F W Eurich, Dr J Beattie Dunlop Dr W Wragham and Mr W Mitchell (in charge of Electrical Department). Consulting Surgeon Mr Harry Meade. Surgeons Mr Charles F M. Althorp Dr Thomas J Wood, Mr John B Hall, and Mr James Phillips. Consulting Gynaecologist Dr A. C. F. Babaghani. Gynaecologist Mr Charles F M. Althorp. Consulting Laryngologist Dr Adolph Bronner. Laryngologist Dr Andrew Little. Assistant Surgeons Mr Francis W Goyder and Mr Peter McKwan. Assistant Physicians Mr W Messer and Dr W N West-Watson. Anaesthetists Dr W E Hayburn Dr R. A. Lankester, Mr J B Lockerbie, and Dr J D McCulloch. Pathologist Mr B Hughes. Consulting Dental Surgeon Mr Arthur A. Matthews. Dental Surgeon Mr H Alvin Mahony.

THE ROYAL SUSSEX COUNTY HOSPITAL. Brighton (264 beds).—This hospital affords ample facilities for students possessing a large out-patient department a library and a well appointed clinical research and bacteriological department. The hospital does not take resident pupils but out-patients may attend the practice of the hospital for any period not exceeding two years on payment in advance of such a fee not exceeding 20 guineas as the Board of Management shall direct. Consulting Physicians Dr Hollis and Dr Branfoot. Physicians Dr J F G Dill Dr Hobhouse and Dr Marnard. Assistant Physicians Dr W Broadbent Dr D Hall and Dr Bailey. Consulting Surgeons Mr N P Blaker Mr W Farmer and Mr T J Veall. Surgeons Mr R F Jowers Mr F J Paley and Mr A. H. Beck. Assistant Surgeons Mr T H Iorides Mr W A. Boring and Mr H N Fletcher. Honorary Medical Clinical Assistant Dr R. Clapham. Honorary Surgical Clinical Assistant Mr A. G. Bate. Ophthalmic Surgeon Mr W W Griffin. Dermatologist Dr A. W. Williams. Dental Surgeon Mr W R Wood. Assistant Dental Surgeon Mr T S Worboys. Pathologist Dr H M Galt.

KENT AND CANTERBURY GENERAL HOSPITAL. Canterbury.—The hospital contains 103 beds. Pupils of the staff are admitted to the practice of the hospital and have the use of the library of the East Kent and Canterbury Medical Society for £7 7s. A Roentgen ray apparatus has recently been given to the hospital. Operation day Thursday 11 A.M. Physicians Dr Harold Wacher and Dr M. T. Williams. Consulting Surgeons Mr Frank Wacher and Mr Z. head Peck, and Mr P J Ferguson. House Surgeon Mr P. A. C. Parnham. Dentist Mr R. S. N. Faro. Secretary Mr Arthur J Lancaster.

DERBYSHIRE ROYAL INFIRMARY, Derby—This hospital contains 260 beds. It was founded in 1810, and was entirely rebuilt and enlarged 1892-1915 on the most modern lines at a cost of over £144,000. There is a separate ophthalmic block of 33 beds, a separate children's block of 34 beds, and a special department for gynaecological cases. There are three resident house surgeons and a resident house physician. There is also a well equipped Finson light and X ray department. Registered medical students are admitted to witness the medical and surgical practice on payment of 10 guineas annually. Consulting Physicians: Dr Charles A. Greaves and Dr G. Rice. Physicians: Dr Edmund Vaudrey, Dr Maurice Parry-Jones, and Dr Hugh Barber. Consulting Surgeons: Mr John A. Sharp, Mr Charles H. Hough, and Mr John L. Wright. Surgeons: Dr Richard H. Luce, Mr John A. Southern, Mr Francis L. A. Greaves, and Mr John E. Kilvert. Ophthalmic Surgeon: Mr Edwin Collier Green. Gynaecologist: Mr Henry T. Hicks. Anaesthetists: Mr W. St. A. St. John, Dr J. D. O. Allen, and Dr A. D. Hunt. Pathologist: Dr Hugh Barber. Dental Surgeons: Mr Charles J. Allin and Mr J. Montague Murphy.

ROYAL DEVON AND EXETER HOSPITAL, Exeter—Medical and Surgical Staff. Consulting Surgeons: Mr J. D. Harris and Mr E. J. Domville. Physicians: Dr H. Davy and Dr William Gordon. Surgeons: Mr Charles E. Bell and Mr A. C. Roper. Assistant Surgeons: Mr Brennan Dyball and Mr A. L. Candler. Assistant Physician and Pathologist: Mr Reginald V. Solly. Surgical Registrar and Assistant Pathologist: Mr A. L. Candler. Surgeon Dentist: Mr J. M. Ackland. Anaesthetists: Mr Henry Andrew and Mr J. Shirley Steele-Perkins. Medical Officer in Charge of the Electrical Treatment Department: Mr J. Delpratt Harris. Assistant Medical Officer in charge of the Electrical Treatment Department: Mr Frank A. Roper. Surgeon in charge of the Ear, Throat and Nose Department: Mr Robert Worthington. The hospital contains 200 beds (including special children's wards) and has a good library, museum, dissecting room, and post-mortem room. Attendance on the practice of this hospital qualifies for all the examining boards. There is also a Private Nursing Staff attached to the hospital. For particulars as to fees, &c., apply to the Matron. A new wing was added in 1897. Arrangements may be made by which gentlemen in practice desiring to increase their qualifications may have the use of the museum and library and other facilities and by which students may attend midwifery. A new Operating Theatre was opened in 1906 (the gift of Mrs. Nosworthy of Newlands, Dawlish, Devon). The Electrical Treatment Department (the gift of Mrs. M. A. Sanders) was opened in 1907 by Lady Duckworth King.

WEST OF ENGLAND EYE INFIRMARY, Exeter—Physician: Dr William Gordon. Surgical Staff: Mr A. C. Roper and Mr Ransom Pickard. Assistant Surgeon: Mr G. P. Hawker. Secretary: Mr W. W. Beer. The infirmary contains 64 beds. Students of the Exeter Hospital can attend the practice of the Eye Infirmary. Patients for the year ending Michaelmas, 1916, 2617.

THE GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION, Gloucester—This hospital, which was granted the title of "Royal" on the occasion of King Edward VII's visit to Gloucester in the year 1909, has 140 beds. Consulting Surgeons: Mr T. S. Ellis, Mr R. M. Cole, Mr H. E. Waddy, and Mr E. Dykes Bower. Physicians: Dr W. W. Grosvenor and Dr D. E. Finlay. Assistant Physician: Dr H. Cairns Terry. Surgeons: Mr W. Washbourn, Mr G. W. Ancrum, and Mr C. V. Knight. Ophthalmic Surgeon: Mr E. Dykes Bower. Assistant Surgeon: Mr A. Alcock. Secretary: Mr H. P. Pike. In-patients, 1652; out-patients, 7230.

NORTH STAFFORDSHIRE INFIRMARY, Hartshill, Stoke-on-Trent—The New Infirmary, opened in 1869, is built on the pavilion plan, has accommodation for about 240 patients, including Children's wards, and a special department for the treatment of Diseases of the Eye, a special X Ray and Electrical Department, and a special department for the treatment of Diseases of the Ear, Nose and Throat, so that there are excellent facilities for acquiring a practical knowledge of the profession. During the last six years the sum of £35,000 has been spent on new buildings and

alterations. A new Out-patient Department, costing £12,000, a new Children's Ward of 30 beds, a new Pathological Department, and a second large Operation Theatre are amongst the structural improvements already completed. The whole institution is now equipped in a thoroughly up-to-date manner. Honorary Consulting Physician: Dr A. M. McAldowie. Honorary Consulting Surgeons: Mr W. D. Spanton and Mr G. Stokes Hutton. Physicians: Dr S. King Alcock, Dr H. Nicholls, and Dr J. Russell. Surgeons: Mr Wheelton Hind, Mr Reginald Alcock, and Mr W. O. Allardice. Assistant Physicians: Dr W. E. L. Horner, Dr G. H. Sowry, and Dr E. O. Myott. Assistant Surgeons: Mr Harold Hartley, Mr Eric E. Young, and Mr W. Webster. Consulting Ophthalmic Surgeon: Mr H. H. Folker. Ophthalmic Surgeon: Mr R. H. Dickson. Assistant Ophthalmic Surgeon: Mr S. McMurray. Medical Officers in charge of the Electrical Department: Dr G. H. List and Dr A. H. John. Surgeon in charge of Ear, Nose, and Throat Department: Mr G. A. Carter. Dental Surgeon: Mr J. D. Skae. Honorary Anaesthetists: Dr G. Blair and Dr C. H. McT. Secretary and House Governor: Mr T. Basil Rhodes.

HULL ROYAL INFIRMARY, Hull—This hospital contains 244 beds. Consulting Physician: Dr Edward O. Daly. Consulting Surgeons: Sir John Sherburn, Mr Thomas M. Evans, Mr Robert H. B. Nicholson, and Mr Edmund H. Howlett. Consulting Dental Surgeon: Dr J. Charles Storey. Consulting Ophthalmic Surgeon: Dr W. O. Rockliffe. Physicians: Dr Frank Nicholson, Dr Frank C. Eye, and Dr Edward Turton. Surgeons: Mr Alfred G. Francis, Mr Henry W. Pigeon, Mr Edward Harrison, and Mr Edward M. Hainworth. Ophthalmic Surgeon: Dr Duncan Mackay. Assistant Ophthalmic Surgeon: Mr William Bainbridge. Assistant Surgeons: Mr Harold Upcott, Mr Robert Grieve, and Mr Guy B. Nicholson. Assistant Medical Officer: Mr Stanley E. Denyer. Dental Surgeon: Mr Arthur W. Turton. Assistant Dental Surgeon: Mr Stanley R. Storey. Anaesthetists: Mr Harry L. Evans and Dr Arthur T. Sissons.

LEICESTER ROYAL INFIRMARY, Leicester—Instruction in the infirmary for first-year students is duly recognised by the various examining bodies. At the General Infirmary there are 230 beds, and at the Children's Hospital in connexion 70, total 300. The number has been temporarily increased and 180 beds have been placed at the disposal of the War Office for wounded soldiers. A new wing containing 100 beds was recently opened by H. R. H. the Duchess of Argyll, and a new Nurses' Home containing separate accommodation for 100 nurses has also been opened. A reconstruction scheme has been carried out, and £120,000 spent on bringing the accommodation of the institution to a modern standard of efficiency. This scheme has included the provision of two modern operating theatres, as well as a self-contained out-patients' department. The Children's Hospital has been reconstructed and enlarged by the addition of a third ward at a cost of £14,500. Open air balconies on all three floors are a feature. A central sterilising department has been provided. Plans have been passed for a new Pathological Laboratory and post-mortem rooms at an estimated cost of £5000. There are eight resident medical officers—viz., two house surgeons, one house physician, two assistant house surgeons, one assistant house physician, and two dressers. All receive salaries. The dressers are given an honorarium of £10 10s on completion of six months' satisfactory service. Consulting Surgeons: Mr George C. Franklin, Mr Claude Douglas, and Mr C. J. Bond. Physicians: Dr Reginald Pratt, Dr Astley V. Clarke, Dr Robert Sevestre, Dr T. Villiers Crosby, and (temporary) Dr J. D. Slight. Surgeons: Mr Henry J. Blakesley, Mr Cecil E. Marriott, Mr J. S. Sloane, and Mr F. Bolton Carter. Ophthalmic Surgeon: Mr Nicholas C. Ridley. Aural Surgeon: Dr Frederick W. Bennett. Physician to Out-patients: Dr T. Arnold Johnston (Honorary Pathologist). Surgeons to Out-patients: Mr W. I. Camberidge and Mr T. O. Clare. House Governor and Secretary: Mr Harry Johnson.

NORTHAMPTON GENERAL HOSPITAL, Northampton—Two new wings were opened in 1904 and the old building entirely renovated and rearranged. The number of beds is 298. Non-resident pupils are received and have every opportunity of acquiring a practical knowledge of their profession. The fee is £10 10s. Pupils can be received at any time.

Clinical Assistants in the Ophthalmic Department Mr O B Baxter, Mr R H Cotton, and Mr F H P. Willis. Clinical Assistant in the Aural Department Mr L. Powell.

SALISBURY GENERAL INFIRMARY, Salisbury.—This hospital contains 200 beds. Consulting Physician Dr G G Morrice. Consulting Surgeon Mr L S Luckham. Physicians Dr W W Ord and Mr J E Gordon. Surgeons Dr O G B Kempe and Dr E T Fison. Assistant Surgeons Mr J Armitage and Mr T B Henderson. Physician in charge of the X Ray Department Dr G E Thornton. Ophthalmic Surgeon Mr P C Bardsley. Surgeon Dentist Mr F Gordon. Honorary Anaesthetists Dr G E Thornton and Dr L D Saunders. Secretary Mr S B Smith. In patients, 135 weekly average, out-patients, 1013, including dental cases 347, ophthalmic cases 72, and X ray cases 416, attendances on 2842 casuals.

ROYAL SALOP INFIRMARY, Shrewsbury.—This hospital has 150 beds. Consulting Physicians Dr E Burd, Mr R. W O Withers, Dr E Lycett Burd, and Colonel E Cureton, M D V D. Physicians Dr H W Gardner, Dr R H Urwick, and Dr F Whincup. Consulting Surgeon Mr W Eddowes. Surgeons Mr A Jackson, Mr H H B MacLeod, and Mr L J Godson. Ophthalmic Surgeon Mr O G Russ Wood. Pathologist Dr F A. Anderson. Assistant Pathologist Dr R. Osborn Smyth. Radiographer Mr W S Edmond. Dental Surgeon Mr W E Harding. Honorary Health Officer Mr James Wheatley. Secretary Mr Alfred Sugden. In patients, 1468, out-patients 904, out-patients' attendances for the year, 15,846.

ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL, Southampton.—This hospital contains 130 beds. Physicians Dr N E Aldridge and Dr H P Ward. Assistant Physicians Dr J H P Fraser, Dr B N Tebbs, and Dr H J Nightingale. Surgeons Extraordinary Mr W Sims and Mr A B Wade. Surgeons Mr H W Shettle, Mr J R Keele, and Mr W P Purvis. Assistant Surgeon Mr G H Cowen. Throat and Ear Surgeon Mr W P Purvis. Dental Surgeon Mr E G Robertson. Electro-Therapeutic Department Dr N E Aldridge. Secretary Mr T A. Fisher. Hall. In patients 2107, out-patients, 10,024.

STAFFORDSHIRE GENERAL INFIRMARY, Stafford.—This hospital has 77 beds. Honorary Consulting Physician Dr G Reid. Physicians Dr O Reid and Dr L Gray. Surgeons Mr F M Blumer and Mr F H Marson. Assistant Honorary Surgeon Mr F N Cookson. Ophthalmic Surgeon Mr A B Ordland. Surgeon Dentist Mr W H Ridge. Secretary Mr R Battle. In patients, 839, out-patients, 2399.

ROYAL HANTS COUNTY HOSPITAL, Winchester.—This hospital has 108 beds. Honorary Consulting Physicians Dr W M Harman and Dr H E Wingfield. Physicians Dr G F A. England, Dr A. E. Bodington, and Dr G A. Tullis. Surgeons Mr H J Godwin, Mr F J Child, and Mr G A Roberts. Honorary Ophthalmic Surgeon Mr A. Zorab. Honorary Dental Surgeon Mr L M Balding. Honorary Medical Officer in charge of the X Ray Department Dr Norman Aldridge. Secretary Mr Edwin J Pearce.

WOLVERHAMPTON AND STAFFORDSHIRE GENERAL HOSPITAL, Wolverhampton.—There are 208 beds. Special departments for Children, Gynaecology, Ear Throat, and Nose Diseases. Electro-therapeutic and X ray and Pathological departments. There is an excellent library and three house surgeons. Consulting Surgeon Mr W H T Winter. Physicians Dr H Malet, Dr J A Codd, and Dr A. H Carter. Surgeons Mr E Deanesly, Mr A. H. Hunt, Mr W F Cholmeley, and Mr Howard Dent. Assistant Physicians Dr E H Coleman and Dr T H Galbraith. Assistant Surgeon Mr O A. Stidston. Anaesthetists Dr E W Strange, Mr David Mann, Dr F R Armitage, and Dr J N McTurk. Pupils are allowed to witness the whole of the practice of the hospital and to be present at practical knowledge of their profession. Fees £3 3s a quarter, £10 10s the first year and £5 5s subsequent years. A course of Practical Pharmacy is given by the dispenser. Fee £3 3s for three months. Applications should be made to the Secretary of the Medical Committee.

WORCESTER GENERAL INFIRMARY, Worcester—This hospital has 132 beds (temporarily reduced to 70) Pupils are taken by members of the Honorary Medical and Surgical Staff Number of operations last year 899 New X Ray and Electrical Departments have been recently erected and are now in use Additional accommodation for the Honorary Staff and Out patients and also an Outdoor Shelter in connexion with the Children's Ward have been built as a memorial to King Edward VII Consulting Physician Dr M Read Physicians Dr G W Crowe Dr H A Watson and Dr Neville Crowe Surgeons Mr T P Gostling, Mr C Pollard, and Mr T Bates, jun. Secretary Mr E J Holland In patients, 1250, out-patients, 3758

YORK COUNTY HOSPITAL, York—This hospital contains 170 beds, 120 beds are in use by military patients, 50 of which are included in the 170 mentioned There are balconies for outdoor treatment and two installations of X Ray apparatus Consulting Physicians Dr Richard Petch and Dr Richard Turner Physicians Dr William A Evelyn and Dr G W Micklethwait Consulting Surgeons Mr Frederick Shann and Mr William H Jalland Surgeons Mr G Wilfred Gostling, Dr Noel L Hood, Mr Gerald S Hughes, and Mr W Paynter Noall Ophthalmic Surgeon Dr Peter Macdonald Assistant Ophthalmic Surgeons Dr M D Ferguson, Dr J Acomb, and Dr T H Barton Electro therapeutic Department Dr Hinton E Bateman and Dr J G Craig Anaesthetists Mr Robert Fell and Dr Stanley Upton Assistant Anaesthetist Dr J H Sutcliffe Consulting Dental Surgeon Mr Walter Glaisby Dental Surgeon Mr Leonard A Glaisby

II—SCOTLAND

THE UNIVERSITIES

UNIVERSITY OF EDINBURGH

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh—viz, Bachelor of Medicine (M B), Bachelor of Surgery (Ch B) Doctor of Medicine (M D), and Master of Surgery (Ch M) The degree of Bachelor of Surgery cannot be conferred on any person who does not at the same time obtain the degree of Bachelor of Medicine and similarly the degree of Bachelor of Medicine is not conferred on any person who does not at the same time obtain the degree of Bachelor of Surgery

A diploma in Tropical Medicine and Hygiene (D T M and H) is granted to graduates in Medicine and Surgery of the University of not less than six months' standing, and to Registered Medical Practitioners who, having resided in a tropical country, may be approved by the Senatus, on the recommendation of the Faculty of Medicine

No one is admitted to the degrees of *Bachelor of Medicine* and *Bachelor of Surgery* who has not been engaged in Medical and Surgical study for five years. No course of lectures will be allowed to qualify unless the lecturer certifies that it has embraced at least 100 lectures or 50 lectures as may be required by the regulations, and that the student has also duly performed the work of the class

Candidates for the degrees of M B and Ch B must have attended for at least three academic years the medical and surgical practice either of the Royal Infirmary Edinburgh or of a general hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons They must have attended Clinical Surgery during a course or courses extending over not less than nine months and courses of instruction in all the subsidiary subjects They must have personally conducted, under the superintendence of a registered medical practitioner 20 cases of labour at least.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations have effect—Two of the five years of medical study must be spent in the University of Edinburgh The remaining three years may be spent in any University of the United Kingdom, or in any Indian, Colonial, or Foreign university recognised for the purpose by the University Court or in such medical schools or under such teachers

as may be recognised for the purpose by the University Court Of the subjects of study—viz Anatomy Practical Anatomy, Chemistry, Practical Chemistry, Materia Medica, Physiology, Practical Physiology Practice of Medicine Surgery, Midwifery and Diseases of Women, Pathology, Practical Pathology Physics, Botany, Zoology, Medical Jurisprudence, and Public Health—not less than one half must be taken in the University of Edinburgh, which corresponds to the two years above referred to

Women are admitted to graduation in medicine under practically the same conditions as men, excepting that, until provision is made in the University for instruction of women in all subjects of the medical curriculum the regulations as to places of study contained in the foregoing paragraph do not apply to them Women who study in Edinburgh receive their instruction from recognised Extra Academical Teachers, who are Lecturers in the School of Medicine for Women, Surgeons Hall

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery is £23 2s, and the proportion of this sum to be paid by a candidate at each division of the examination shall be as follows—viz. For the First Division of the Examination (Botany, Zoology, Physics and Chemistry), £6 6s, for the Second Division (Anatomy and Physiology), £5 5s, for the Third Division (Pathology and Materia Medica and Therapeutics) £4 4s, and for the Final Division (Surgery and Clinical Surgery Medicine and Clinical Medicine, Midwifery, Clinical Gynaecology, and Forensic Medicine and Public Health), £7 7s

Bachelors of Medicine and Bachelors of Surgery may proceed to the degrees of *Doctor of Medicine* and *Master of Surgery* after they have spent one year in the medical or surgical wards respectively of a hospital or the Military or Naval Medical Services, or in scientific work bearing directly on their profession, or two years in practice In each case an examination must be passed and a thesis submitted for approval of the Faculty The fee to be paid for the degree of M D is £15 15s and the fee to be paid for the degree of Ch M is £15 15s

Diploma in Psychiatry—Courses of instruction have also been instituted for a Diploma in Psychiatry open to all legally qualified Medical Practitioners who conform with the Regulations There shall be two examinations for the Diploma, the first comprising the subjects of Anatomy of the Nervous System, Physiology Histology and Chemistry of the Nervous System, Pathology of the Brain and Nervous System, and Practical Bacteriology in its relation to Mental Diseases, and the second examination comprising the subjects of Psychology with Experimental Psychology, Clinical Neurology, and Psychiatry (systematic and clinical). The fee for each examination shall be £5 5s

Professors—Chemistry James Walker D Sc, FRS Zoology J Cossar Ewart, M D Botany I Bayley Balfour, M D Physiology Sir E A Schäfer FRS Anatomy Arthur Robinson M D Pathology James Lorrain Smith M D Materia Medica Sir Thomas R Fraser, M D, FRS Forensic Medicine Harvey Littlejohn, M B, F R O S E Public Health C Hunter Stewart M B, D Sc. Midwifery Sir John Halliday Croom, M D Surgery Alexis Thomson, M D F R O S E Medicine Geo Lovell Gulland M D Clinical Surgery F M Caird M B F R O S Clinical Medicine Sir Thomas R Fraser, M D William Russell, M D and Geo Lovell Gulland

The University of Edinburgh is especially rich in scholarships and prizes in medical subjects Full particulars can be obtained from the Dean of the Medical Faculty

SCHOOL OF MEDICINE OF THE ROYAL COLLEGES Edinburgh—The number of students varies much in the classes and subjects It is within the limit to say that about 1000 students avail themselves each session of the opportunity of attending the school The lecture-qualify for the University of Edinburgh and other Universities, the Royal Colleges of Physicians and Surgeons of London, Edinburgh and Dublin, the Faculty of Physicians and Surgeons of Glasgow, and other Medical and Surgical and Public Boards

The anatomy rooms and laboratories will open and the lectures commence on Oct 10th

In accordance with the statutes of the University of Edinburgh one-half of the qualifying classes required for graduation may be attended in this school The regulations require that the fee for any class taken for graduation in

Edinburgh shall be the same as that for the corresponding class in the University. The whole education required for graduation at the University of London may be taken in this school.

The appointment of Resident Physician to the wards in the Royal Infirmary under the care of the Ordinary Physicians is open to those members of their clinical class who have held the office of clerk in their wards for at least six months. Six Residencies are appointed for a period of six months each. Resident Surgeons are also appointed by the Ordinary Surgeons to the Hospital. In all respects the students are taught under regulations similar to those at the University of Edinburgh and the other Universities of Scotland and they receive similar certificates at the close of each session. The courses of special non-qualifying subjects have for the last quarter of a century formed a marked feature of the school. Indeed, such medical subjects could be studied in Edinburgh only in this school until lately when the University of Edinburgh appointed from the school lecturers on Diseases of the Eye, Insanity and Diseases of Children to take charge of classes intramurally. A list of the classes and lecturers will be found below. Special courses of instruction for dental students and for women are also included in the curriculum of this school.

Lecturers and Fees—Winter Session. Anatomy Practical Anatomy, and Demonstrations Dr Ryland Whitaker (£3 5s. and £4 4s.), Chemistry (Practical) Mr Gemmell and Dr T W Drinkwater*, Physiology (Institutes of Medicine) Dr Alex. Goodall (£3 5s.), General Pathology &c Dr James Miller (£3 5s.), Biology Mr Malcolm Laurie and Mr C R Whittaker (£3 5s.), Zoology, Mr Malcolm Laurie and Mr H. Miller, Physics Dr Dawson Turner and Mr A. McKendrick (£3 5s.), Meteorology Dr Dawson Turner and Mr A. McKendrick (£2 2s.), Bacteriology Dr Taylor Grant and Dr James Miller, Practice of Physics Dr R A. Fleming, Dr E Bramwell and Dr A. Dingwall Fordyce (£3 5s.) Surgery Mr Scot Skirving Mr Chiene Mr H Wade Mr J W Struthers Mr W J Stuart and Mr L Beesly (£3 5s.), Maternal Medicine &c Dr Craig and Dr J Orr (£3 5s.), Midwifery, &c. Dr Hart Dr Ballantyne Dr Haig Ferguson Dr Elsie Inglis, Dr McGibbon Dr Barbour Simpson, and Dr Davidson (£3 5s.) Medical Jurisprudence &c, Dr Aitchison Robertson (£3 5s.), Public Health Dr W Robertson (£2 2s.), Hospital Practice (Edinburgh Royal Infirmary) Physicians Sir R W Philip Dr Graham Brown Dr F D Boyd Dr R A. Fleming and Dr Brewis for Gynaecology Surgeons Mr Cathcart Mr Hodson Mr Wallace and Mr Miles (perpetual hospital ticket £12) Clinical Medicine Sir R W Philip Dr Graham Brown Dr F D Boyd Dr R A. Fleming and Dr Brewis for Gynaecology (£3 5s.), Clinical Surgery Mr Cathcart, Mr Hodson Mr Wallace and Mr Miles (£3 5s.), Tuberculosis Sir R W Philip (Clinical) Dr Miller (Pathological) Vaccination Dr W G A Robertson and Dr Wm D D Small (£1 1s.), Diseases of Ear, Nose, and Throat Dr J Malcolm Farquharson and Dr J S Fraser (£2 2s.) Diseases of the Eye Dr J V Paterson (£2 2s.) Ophthalmoscopy Dr A. H H Sinclair (£2 2s.), Gynaecology Dr Haig Ferguson and Dr Elsie Inglis (Systematic) Dr Brewis and Dr J Haig Ferguson (Clinical) and Dr J W Ballantyne (Advanced) (£2 2s.) Physical Methods Dr A. D Webster (£2 2s.), Medical Electricity Dr Dawson Turner (£2 12s. 6d.) Tropical Diseases Major D G Marshall I.M.S. (£2 2s.) Diseases of Children Dr A. Dingwall Fordyce (£2 2s.) Diseases of the Skin Dr F Gardiner (£2 2s.) Summer Session. Practical Anatomy and Demonstrations Dr Ryland Whitaker (£2 2s.), Practical Physiology Dr Goodall (£3 3s.) Biology Mr W Laurie & Dr Newbigin and Mr C R Whittaker (£3 5s.) Practical Chemistry and Analytical Chemistry Mr Gemmell and Dr Drinkwater*, Practical Bacteriology Dr Taylor Grant and Dr James Miller, Maternal Medicine Dr Craig and Dr J Orr, Diseases of the Eye Dr J V Paterson (£2 2s.); Medical Psychology and Insanity, Dr John Keay (£2 2s.); Medical Jurisprudence Dr Aitchison Robertson, Public Health Dr W Robertson (£2 2s.), Gynaecology Dr Brewis (£2 2s.), Midwifery Lectures Dr Ballantyne, Dr Haig Ferguson Dr McGibbon Dr Barbour

Simpson and Dr Davidson (£3 5s.), Practical Gynaecology Dr Elsie Inglis (£2 2s.), Operative Surgery, Mr Scot Skirving Mr Chiene, Mr H Wade, Mr J W Struthers, Mr W J Stuart, and Mr L Beesly (£3 3s.), Practical Pathology, Dr James Miller (£3 8s.); Physics, Dr Turner and Mr A. McKendrick (£3 5s.); Practical Medicine and Physical Diagnosis Dr Fleming, Dr A. Goodall and Dr J D Comrie (£3 3s.), Clinical Medicine, Sir R W Philip Dr Graham Brown Dr Boyd, Dr R A Fleming and Mr Brewis for Gynaecology (£2 4s.), Vaccination Dr W G A Robertson and Dr W D D Small (£1 1s.); Physical Methods Dr A. D Webster (£2 2s.), Diseases of Ear, Nose and Throat Dr J Malcolm Farquharson and Dr J S Fraser (£2 2s.), Tropical Diseases Major D G Marshall, I.M.S. (£2 2s.), Medical Electricity Dr Dawson Turner, Meteorology Dr Dawson Turner and Mr A. McKendrick Tuberculosis Sir R W Philip (Clinical) and Dr Miller (Pathological), Diseases of Children Dr A. Dingwall Fordyce (£2 2s.), Diseases of the Skin, Dr F Gardiner (£2 2s.)

The minimum cost of the education in this School of Medicine for the Triple Qualification of Physician and Surgeon from the Royal Colleges of Physicians and Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow including the fees for the Joint Examinations is about £120 payment of which is distributed over the period of study. There is no composition fee.

Further particulars regarding the school also its calendar may be had on application to the Dean of the School, 11, Bristo-place, Edinburgh.

* Lectures £3 5s. Practical, £3 3s. Analytical £2 a month, or £5 for three months. † Also in Summer Session. ‡ Also in Winter Session. § Practical, £3 3s. Analytical, £2 a month, or £5 for three months.

N.B.—Where two or more lecturers appear as teaching the same subjects their lectures are not conjoined, but each gives an independent course.

Clinical Instruction—ROYAL INFIRMARY Edinburgh.—This hospital has 921 beds and 42 cots for children. Courses of Clinical Medicine and Surgery are given by the physicians and surgeons. Special instruction is given on Diseases of Women Physical Diagnosis, Diseases of the Skin, Diseases of the Eye, the Ear, the Larynx, and the Teeth. Separate wards are devoted to Venereal Diseases Diseases of Women Diseases of the Eye the Ear Throat and Nose, and the Skin and also to cases of Incidental Delirium or Insanity. There are also large and complete Medical Electrical and X Ray and Bathing Departments. Three wards are specially set apart for Clinical Instruction to Women Students. Post-mortem examinations are conducted in the anatomical theatre by the pathologist and his assistants, who also give practical instruction in Pathological Anatomy and Histology. The fees for hospital attendance are as follows—viz. Perpetual ticket, in one payment £12, annual ticket, £6 6s., six months, £4 4s., three months £2 2s. monthly, £1 1s. Separate payments amounting to £12 12s. entitle the student to a life ticket. No fees are paid for any medical or surgical appointment. The appointments are as follows 1. Resident physicians and surgeons are appointed and live in the house free of charge. The appointment is for six months but may be renewed at the end of that period by special recommendation. 2. Non resident house physicians and surgeons and clinical assistants are appointed for six months. The appointment may be renewed for a like period by special recommendation. 3. Clerks and dressers are appointed by the physicians and surgeons. These appointments are open to all students and junior practitioners holding hospital tickets. 4. Assistants in the Pathological Department are appointed by the pathologist.

Staff—Consulting Physicians Sir James Affleck, Dr Alexander James Dr Bryon Bramwell and Emeritus Professor W S Greenfield. Physicians Sir Thomas R Fraser Sir R W Philip, Professor William Russell Professor Lovell Galland Dr Graham Brown and Dr F D Boyd. Assistant Physicians Dr R A. Fleming, Dr Harry Ranny Dr Chalmers Watson, Dr Edwin Bramwell, Dr Edwin Matthew Dr W T Ritchie Dr John Eason Dr John D Comrie and Dr Alex Goodall Consulting Surgeons Mr A. G. Miller Dr C W MacGillivray, Emeritus Professor John Chiene C.B., and Mr J M Cortell. Barbour and Mr N T Brewis Assistant Gynaecologists Dr J Haig Ferguson and Dr William Fordyce Physicians to the Skin Department Dr Norman Walker and Dr Fred Gardiner Assistant Physician to the Skin Department Dr R Cranston Low Consulting Surgeons to the Ophthalmic Department Sir George A Berry and Dr George Mackay Surgeons to the Ophthalmic Department Dr W G Sym and Dr J V Paterson Assistant Surgeons to the Ophthalmic Department Dr A. H. H. Sinclair and Dr H M Traquair Consulting Surgeons to the Ear and Throat Department Dr P M'Bride and Dr R M'Kenzie Johnston Surgeons to the Ear and Throat Department Dr A Logan Turner and Dr J Malcolm Farquharson Assistant Surgeons to the Ear and Throat Department Dr John S Fraser and Dr John D Lithgow Consulting Surgeon to the Dental Department Mr William Gay Surgeon to the Dental Department Mr J H Gibbs Extra Medical Electrician (for Radium Cases) Dr Dawson Turner Medical Electricians Dr W Hope Fowler and Dr Archibald M'Kendrick, Pathologist Professor Lorrain Smith Clinical Pathologist, Miss Fitzgerald Assistant Pathologist Dr James Miller

ROYAL HOSPITAL FOR SICK CHILDREN, Sciennes road, Edinburgh—This hospital contains 120 beds, and is fitted with every modern improvement. A fully equipped out-patient department (medical and surgical) is conducted daily in a building adjoining the hospital. Systematic courses of instruction, which qualify for graduation in the Edinburgh University and elsewhere, are given from time to time throughout the year by the staff. Students may enter at any time. Full particulars can be obtained from the Registrar at the hospital.

Staff—Consulting Physicians Dr J Carmichael, Dr J Playfair, and Dr T M Burn Murdoch. Consulting Surgeon (vacant). Consulting Surgeon Dentist (vacant). Consulting Pathologist Professor J Lorrain Smith. Consulting Bacteriologist Professor J Ritchie. Ordinary Physicians Dr J Thomson, Dr J S Fowler, and Dr J W Simpson. Surgeon Mr H J Stiles. Ophthalmic Surgeons Sir G A Berry, and Dr A. H. Sinclair. Assistant Surgeon Mr J Fraser. Surgeon to Ear and Throat Department Mr W G Porter. Medical Electrician Dr J W Spence. Extra Physicians Dr Dingwall Fordyce, Dr O McNeil, and Dr Norman S Carmichael. Anaesthetists Dr M H Howard Jones and Dr Lancelot Foster.

EYE, EAR, AND THROAT INFIRMARY OF EDINBURGH, 6, Cambridge street, Lothian road—Clinical Lectures and Instruction are given in this institution, which is open at 1 o'clock daily for outdoor patients for Eye Diseases, Mondays, Thursdays, and Saturdays at 12 noon, and Tuesdays and Fridays at 4 P.M. for outdoor Ear, Nose, and Throat Patients. Special Practical Ophthalmoscopic Classes by arrangement. Patients whose diseases require operations or more than ordinary care are accommodated in the house. Consulting Surgeon Dr Logan Turner (Ear, Nose and Throat Department). Surgeons Dr William George Sym, Dr J V Paterson, Dr W G Porter, Dr E M Lithgow, Dr W T Gardiner, Dr John M Darling, and Dr Ernest H Cameron. Honorary Anaesthetist Mr J H Gibbs. Dental Surgeon Mr G W Watson. Treasurer and Secretary Mr J P Watson, W S, 32, Charlotte-square.

UNIVERSITY OF GLASGOW

The University of Glasgow is both a teaching and a degree-granting body, but admits to graduation only candidates whose preliminary examination and course of study conform to its own regulations. Within certain limits instruction given by recognised medical schools and teachers may be accepted, but not less than one-half of the subjects other than clinical must be taken in this or some other recognised university, and at least two years of the course must be taken in Glasgow University. Six degrees, open both to men and women, are conferred M B and Ch B (always conjointly), M D and Ch M, B Sc in Public Health, D Sc in Public Health, and B Sc in Pharmacy. A Preliminary Examination must

be passed in (1) English (2) Latin, (3) Elementary Mathematics, and (4) Greek, or French, or German, or Italian, with possible options to students whose native language is not English. Candidates taking the University preliminary examination are not obliged to pass in all the four subjects at one examination but must do so at not more than two occasions.

For the degrees of M B and Ch B a curriculum of five years is required. The candidate must during his curriculum, have attended a course or courses of instruction in each of the following subjects of study, extending over not less than the number of terms specified in each case, and including such class examinations as may be prescribed in connexion with the several courses—Chemistry (including Organic Chemistry), two terms, with Practical Chemistry, one term, Physics (with practical work), one term, Botany (with practical work), one term, Zoology (with practical work), one term, Anatomy and Practical Anatomy, five terms, Physiology and Practical Physiology, three terms, Materia Medica and Therapeutics (together or separately), each subject, one term, Pathology and Practical Pathology three terms, Medical Jurisprudence and Public Health (together or separately), each subject, one term, Midwifery and Diseases peculiar to Women and to Infants, two terms, Surgery, two terms, Medicine, two terms. Candidates must attend at least three years the Medical and Surgical Practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons. At least nine months' hospital attendance is required on both Clinical Surgery and Clinical Medicine, and the student must have acted for six months as clerk in medical and dresser in surgical wards and must have had six months' outdoor practice, he must also have attended a course of Mental Diseases and of Practical Pharmacy (25 meetings) must have been properly instructed in Vaccination at a public vaccination station, and must have attended at least 20 cases of labour and the Practice of a Lying-in Hospital. The University also requires further study in various special subjects.

There are four Professional Examinations, the first comprising Botany, Zoology, Physics and Chemistry, the second comprising Anatomy and Physiology, the third comprising Materia Medica and Therapeutics and Pathology, and the fourth or final, comprising Medical Jurisprudence and Public Health, Surgery and Clinical Surgery, Practice of Medicine and Clinical Medicine and Midwifery and the Diseases peculiar to Women and to Infants.

The degrees of M D (Doctor of Medicine) and Ch M (Master of Surgery) are higher degrees in Medicine and Surgery respectively, and candidates (not under 24 years of age) who have previously obtained the double bachelor ship may be admitted to either M D or Ch M on completing the after course prescribed, including an examination in Clinical Medicine for M D and an examination in Surgical Anatomy, operations on the dead body, and Clinical Surgery for Ch M.

Fees—The Fees for M B and Ch B are £23 2s. The class fee in each subject of the curriculum for M B and Ch B is £2 2s, £3 3s, or £4 4s, and the present fees for hospital attendance are £10 10s. The fee for M D is £15 15s, and for Ch M £15 15s.

The great majority of the students take their hospital course at the Western Infirmary, or the Royal Infirmary, where clinical instruction is given by professors of the University and others. Clinical instruction on Fevers is given at Ruchill and Belvidere Hospitals, while special courses, largely of a practical nature and embracing work in Hospital or Asylum wards, are conducted by University Lecturers on the Ear, the Throat and Nose, Dermatology, Ophthalmology, Venereal Diseases, and Insanity. Queen Margaret College, sometime conducted as a separate institution for the higher education of women was made over to the University in 1892, and in it medical classes for women are conducted under University professors and other lecturers appointed by the University Court whilst for clinical instruction female students are admitted to the Royal Infirmary.

Professors—Natural Philosophy A. Gray, LL D F.R.S. Materia Medica Ralph Stockman, M D Chemistry (Vacant) Surgery Sir William MacEwen, M D, F.R.S.

and Robert Kennedy, M.D., D.Sc. Practice of Medicine T. K. Monro, M.D., and W. K. Hunter, M.D., D.Sc. Midwifery Murdoch Cameron, M.D., and J. M. Munro Kerr, M.D. Anatomy Thomas H. Bryce, M.A., M.D. Zoology John Graham Kerr, M.A., F.R.S. Botany F. O. Bower, D.Sc., F.R.S. Physiology D. Noel Paton, B.Sc., M.D., F.R.S. Forensic Medicine John Glaister, M.D. Pathology Robert Muir, M.A., M.D., F.R.S., and J. H. Teacher, M.A., M.D.

In this University Bursaries and Prizes to the annual amount of over £1000 are appropriated to students in the Medical Faculty and there are also several Scholarships and Fellowships which may be held by medical students who have gone through the Arts course. A full list will be found in the University Calendar.

THE ANDERSON COLLEGE OF MEDICINE, Dumbarton road, Glasgow, W.—The following courses are given, which qualify for all the licensing boards and for the Universities of London, Durham, Edinburgh, and Glasgow (the latter two under certain conditions).—In winter Anatomy and Practical Anatomy, (Vacant), Physics, Prof. P. Bennett, Chemistry, Prof. J. R. Watson, Botany, Prof. B. G. Cormack, Zoology, Prof. W. F. Mackenzie, Physiology, Prof. H. Morton, Materia Medica, Prof. J. P. Duncan, Midwifery and Diseases of Children, Prof. Wm. D. Macfarlane, Surgery, Prof. Arch. Young, Practice of Medicine, Prof. J. M. Cowan, Ophthalmic Medicine and Surgery, Prof. A. J. Ballantyne, Aural Surgery, Prof. J. G. Connal, Diseases of Throat and Nose, Prof. John Macintyre, Public Health (Laboratory Course), Prof. C. C. Douglas, Dermatology, Dr. J. G. Tomkinson, Dental Bacteriology, Prof. C. C. Douglas, Dental Surgery and Pathology, J. Watt, Dental Anatomy and Physiology, W. F. Mackenzie, Dental Metallurgy. Mr. Charles Read. In summer Anatomy Practical Anatomy and Osteology, Practical Chemistry, Botany and Practical Botany, Zoology and Practical Zoology, Practical Physiology, Practical Materia Medica and Pharmacy, Medical Jurisprudence (Prof. C. C. Douglas), Diseases of Women (Prof. Wm. D. Macfarlane), Operative Surgery, Ophthalmic Medicine and Surgery, Aural Surgery, Mental Diseases (Dr. Ivy Mackenzie), and Public Health (Lecture Course and Laboratory Course). The Chemical Laboratory is open daily from 10 to 5. The Dissecting room is open in winter from 9 A.M. to 5 P.M. and in summer from 7 A.M. to 5 P.M. The students are assisted in their dissections by the Professor and Demonstrators by whom frequent examinations and demonstrations on the parts dissected are conducted. The supply of subjects for dissection is ample. Candidates for the Licence in Dental Surgery can obtain the full medical curriculum in Anatomy, Chemistry, Physiology, Surgery, Practice of Medicine and Materia Medica. The courses special to Dentistry are also conducted in the Anderson College of Medicine.

The buildings are situated in Dumbarton road immediately to the west of the entrance to the Western Infirmary and adjoining the University. Extensive accommodation is provided for Practical Anatomy, Practical Chemistry, Practical Botany, Practical Zoology, Practical Physiology, Practical Pharmacy, Operative Surgery, and Public Health. Ample provision has also been made for the comfort of students.

The Carnegie Trust extends its benefactions to students at Anderson's College Medical School. Full particulars may be obtained from Sir W. S. McCormick, the Carnegie Trust Offices, Merchants Hall, Edinburgh.

Communications relating to the Medical School to be addressed to the Secretary of the Medical Faculty, The Anderson College of Medicine, Glasgow, W. Communications relating to the Preliminary Examination in General Education to be addressed to Mr. Hugh Cameron, M.A., F.E.I.S. Educational Institute Office, 34 North Bridge street, Edinburgh. Communications relating to the Triple Qualification to be addressed to Mr. Alexander Duncan, B.A., LL.D., Royal Faculty Hall, 242 St. Vincent-street, Glasgow.

The Winter Session will open on Monday, Oct. 16th, 1916, and will close on Thursday, March 22nd, 1917.

The Summer Session will open on Wednesday, April 25th, 1917, and will close on Wednesday, July 4th, 1917.

ST MUNGO'S COLLEGE AND GLASGOW ROYAL INFIRMARY—The classes in St. Mungo's College qualify for the English, Scotch, and Irish Conjoint Boards and, under certain conditions, for the various universities, including the University of London. Students who have fulfilled the conditions of the Carnegie Trust as regards Scottish birth or extraction, age (16 years) and Preliminary Examination, are eligible for the benefits of this Trust during the whole course of their studies at St. Mungo's College. The classes are open to male and female students equally. The minimum fees for all the lectures including hospital attendance, necessary for candidates for the Diplomas of the English or Scotch Colleges of Physicians and Surgeons, amount to £65. Further particulars can be obtained from a syllabus which may be procured free on application to the Secretary of the Medical Faculty, 86, Castle street, Glasgow.

GLASGOW WESTERN MEDICAL SCHOOL—This School has been closed during the war.

QUEEN MARGARET COLLEGE, University of Glasgow (Women's Department of the University)—The classes are taught by professors of the University and other lecturers appointed by the University Court, and it is governed by the University Court and Senate. The curriculum, regulations, and fees are the same as those of the male students, and the University degrees are open to women on the same conditions as to men. They have access to the University Museum and can borrow books from the University Library, besides having a library of reference in Queen Margaret College. The School of Medicine is a special feature of the College, and gives full preparation for the medical degrees of the University. In July 1894 for the first time in the history of any Scottish University, women students graduated in medicine in Glasgow University. 210 women have now taken the degree of M.B., Ch.B. of the University of Glasgow and 20 the degree of M.D. The women students attend classes in the various University Buildings at Gilmore hill, Queen Margaret College and the Royal Infirmary. Owing to the increase in the number of women medical students additional accommodation for session 1916-17 is provided for the classes of Chemistry and Anatomy in Queen Margaret College. Excellent facilities for clinical work are given in the Royal Infirmary, in the Maternity, and other hospitals. The Arthur Scholarship is open every third year to students of first year, other Bursaries are open in Arts and Medicine, and by an ordinance of the Universities Commissioners women are admitted to certain University bursaries, scholarships and fellowships. There is a house of residence for the students of the College coming from a distance. The Winter Session will open on Oct. 16th.

ROYAL INFIRMARY, Glasgow—The ancient connexion between the University of Glasgow and the Royal Infirmary was revived in 1911, when four University Chairs and several University Lectureships were established at the infirmary. St. Mungo's College is situated in the infirmary grounds. The infirmary has including the Ophthalmic Department 835 beds. There are special beds and wards for diseases of women, of the throat, nose and ear, skin, venereal diseases, burns and septic cases. The wards are open to Women Students. At the Out-door Department the attendances in 1915 numbered over 140,000. In addition to the large medical and surgical departments there are departments for special diseases—viz. diseases of women of the throat and nose of the ear, of the eye, of the skin, and of the teeth. Five house physicians and 12 house surgeons having a legal qualification in medicine and surgery, who board in the hospital free of charge, are appointed every six months. Clerks and dressers are appointed by the physicians and surgeons. As a large number of cases of acute diseases and accidents of a varied character are received these appointments are very valuable and desirable. There is a modern and fully equipped Electrical Pavilion, and year by year the latest and most approved apparatus for diagnosis and treatment has been added. The fees are as follows: (a) For hospital practice, including attendance at the out-door department, at the pathological department post-ticket, £7, six months, £2 2s, three months, £1 1s, separate payments amounting to £7 7s, entitle the student to a perpetual ticket, on return of previous season tickets;

(b) for Clinical Lectures, six months, £3 10s., three months, £1 15s., (c) Vaccination, £1 1s., Pathology, £4 4s., Bacteriology, £2 2s.

Staff.—Visiting Physicians Dr W K Hunter, Dr John M Cowan, Dr Mackenzie Anderson, Dr Wm B Jack, and Dr John Henderson Visiting Surgeons Mr J A Adams, Mr J H Pringle Mr H Rutherford, Mr Peter Paterson, Dr Robert Kennedy, Dr A N McGregor, and Mr Thomas Kay Assistant Physicians Dr James Scott, Dr Archd W Harrington, and Dr W Watson Assistant Surgeons Mr John Patrick and Mr John A. L. McIlroy, and Dr James Hendry Diseases of the Ear Dr James Adam, Dr James Harper, and Dr John W Leitch, Diseases of the Skin Dr P N Grant and Dr John Donald, Diseases of the Teeth Mr W Taylor and Mr W R Taylor, Venereal Diseases, Dr David Watson and Dr John Gilchrist Ophthalmic Department—Surgeon Dr Maitland Ramsay, Assistant Surgeons Dr John Rowan, Dr H W Thomson Dr John Gilchrist, Dr J A Wilson, and Dr W H Kiep, Extra Dispensary Surgeons Dr Andrew Ross Muir, Dr T S Barrie, and Dr E B Orr, Electrician Dr Gilchrist, Pathologist Dr John H Teacher, Anaesthetist Dr R R Hengerson, Superintendent Dr J Maxtone Thom

GLASGOW WESTERN INFIRMARY.—This hospital adjoins the University of Glasgow. Number of beds upwards of 600. Special wards are set apart for Diseases of Women and for Affections of the Skin. In the out-patient department there are special clinics for Diseases of Women and for Diseases of the Throat, Ear, Teeth, and Skin. The Clinical Courses are given by the physicians and surgeons, each of whom conducts a separate class, and students require to enter their names at the beginning of the session for the class which they propose to attend. Special instruction is given to junior students by tutors or assistants, and clinical clerks and dressers are selected from the members of the class. All the courses of clinical instruction are recognised by the University of Glasgow and the other boards in the kingdom. In the Pathological Department the course is both systematic and practical, also post-graduate courses, and extends through the winter and following summer, these are likewise recognised by the University for graduation. Fifteen resident assistants are appointed annually, without salary, from those who have completed their course. The fee for hospital attendance is £10 10s. and the fees for clinical instruction are £3 3s. for the Winter Session and £2 2s. for the Summer Session.

A Clinical Laboratory has been opened, and students will receive laboratory instruction from the lecturer on clinical methods.

Staff.—Honorary Consulting Surgeons Sir Hector C Cameron and Sir George T Beaton KCB. Honorary Consulting Gynaecologist Dr W L Reid. Visiting Physicians—Dr Ralph Stockman Dr Wm MacLennan Dr R. Barclay Ness Dr T K Munro and Dr J W Nicol (Skin Department). Visiting Surgeons Sir W Macawen

Dr T K Dalziel, Mr James H Nicoll, Dr Duncan Macartney, Mr G H Edington, and Dr John Morton. Gynaecologist Dr Murdoch Cameron Assistant Physicians Dr James Carslaw, Dr John S M'Kendrick Dr Frank Charteris, and Dr John Gracie Assistant Surgeons Dr Arch Young, Dr M Logan Taylor, and Dr O C Cuthbert. GLASGOW OPHTHALMIC INSTITUTION, 126 West Regent street (29 beds and six cots).—Clinical and systematic course of lectures for students during the winter and summer sessions. In patients 1054, out- or dispensary patients 13,460 Operations on Wednesdays and Saturdays. Honorary Consulting Surgeon Dr D N Knox Surgeon Dr A. Maitland Ramsay Assistant Surgeons Dr John Rowan Dr H. Wright Thomson Dr John Gilchrist Dr J A Wilson and Dr W H Kiep Extra Assistant Surgeons Dr A. R. Muir, Dr T S Barrie and Dr Ellen B Orr Pathologist Dr J H Teacher Electrician Dr John Gilchrist Anaesthetist Dr R H Henderson The institution is the Ophthalmic Department of the Royal Infirmary. A post-graduate course is given by Dr Ramsay and assistants during September. Clinical

instruction is given in the summer session to students of the University and Queen Margaret College, and in winter to students of St Mungo's College and to all who take the class.

GLASGOW EYE INFIRMARY, Berkeley street and Charlotte street.—This institution the largest of its kind in Scotland was founded in 1824. The average number of new patients for the last ten years has been 26 026 and the total number of cases in 1914 was 27 195. The wards and dispensary are recognised by the University of Glasgow for the purpose of instruction in ophthalmology for graduation in medicine. Secretary and Acting Treasurer Harold John Black 88 West Regent street Glasgow. House Superintendent James H. Archibald. The medical session opens in October. The Medical Staff is as follows:—Surgeons Dr A. Freeland Fergus, Dr Andrew Wilson, Dr Leslie Buchanan, Dr A. J. Ballantine, Dr A. Lewis MacMillan and Dr Henry L. G. Leish. Extra Surgeons Dr W. Cochrane Murray and Dr Brownlow Riddell. Assistant Surgeons Dr W. B. Ingham Pollock, Dr Samuel Capie and Dr J. Barbour Stewart. Pathologist Dr M. Logan Taylor. Honorary Consulting Medical Electrician Dr James R. Riddell. Honorary Anaesthetist Dr Fred L. Napier. A Post-graduate Class will be held.

GLASGOW EAR, NOSE, AND THROAT HOSPITAL, 27 and 28 Elmbank crescent.—14 beds and two cots. New patients 3576. Attendances at out-patient department 13 040. Admitted to in-door department 210. Surgeon Dr Thomas Barr. Assistant Surgeons Dr J. Galbraith Connal, Dr W. S. Syme and Dr J. Stoddart Barr. Extra Assistant Surgeons Dr H. Whitehouse, Dr G. B. Eadie and Dr John Donald. Clinical instruction is given in connexion with Dr Thomas Barr's course on Diseases of the Ear at the University, Dr Connal's course on Diseases of the Ear at Anderson's College, and Dr Syme's course on Diseases of the Throat and Nose at the Western Medical School.

UNIVERSITY OF ST ANDREWS (UNITED COLLEGE ST ANDREWS AND UNIVERSITY COLLEGE DUNDEE)

Four degrees in Medicine and Surgery are conferred by the University of St Andrews—viz. Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.) and a Diploma in Public Health. The whole curriculum may be taken at University College, Dundee, or the first two years of the course may be taken at St Andrews and the remaining three years in Dundee. The degrees of M.B. and Ch.B. shall always be conjoined. Before commencing his medical studies each student shall pass a Preliminary Examination in (a) English, (b) Latin, (c) Elementary Mathematics and (d) one of the following optional subjects: (e) Greek, (f) French, (g) German, (h) Italian, (i) any other approved Modern Language. A degree in Arts or in Science in any of the Universities of the United Kingdom and in some colonial and foreign universities shall exempt from the Preliminary Examination. The Preliminary Examination for graduation in Medicine and Surgery, Arts or Science of the University of St. Andrews is accepted as equivalent to the Registration Examination required by the General Medical Council (the certificate to include the required subjects). Also the Final Examination for a degree in Arts or Science and the Final Examination for the Diploma of L.L.B.

Degree of Bachelor of Medicine and Bachelor of Surgery

Candidates must have been engaged in medical study for at least five years. In each of the first four years the candidate must have attended at least two courses of instruction in one or more of the subjects of study specified below, each course extending over a session of not less than five months, either continuous or divided into two terms, or alternatively one such course along with two courses, each extending over a session of not less than two and a half months. During the fifth or final year the candidate shall be engaged in clinical study for at least nine months at the Infirmary of Dundee or at one or more of such public hospitals or dispensaries British or foreign as may be recommended for the purpose by the University Court. The candidate must have received instruction in each of the following subjects of study including such examinations as may be prescribed in the various classes—viz. Anatomy, Practical Anatomy, Chemistry, Materia Medica, Physiology, or Institutes of Medicine, Practice of Medicine, Surgery,

Midwifery and the Diseases peculiar to Women and Infants, Pathology, Practical Chemistry, Physics (including the Dynamics of Solids, Liquids, and Gases and the Rudiments of Sound, Heat, Light, and Electricity), Elementary Botany, Elementary Zoology, Practical Physiology, Practical Pathology, Forensic Medicine, and Public Health. The candidate must have attended for at least three years the Medical and Surgical Practice either of the Infirmary of Dundee or of a General Hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons and is recognised for the purpose by the University Court. Additional subjects of study are Practical Pharmacology, Mental Diseases, Practical Midwifery, Operative Surgery, Vaccination, Children's Diseases, Fevers, Ophthalmology, Diseases of the Ear, Throat, and Nose, Anaesthetics and Post-mortem Examinations.

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations shall have effect:—1. Two of the five years of medical study must be spent in the University of St Andrews. 2. The remaining three years may be spent in any University or in the United Kingdom or in any Indian, Colonial, or Foreign University recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court.

Women are admitted to graduation in Medicine, subject to certain provisions.

Professional Examinations for the Degrees of Bachelor of Medicine and Bachelor of Surgery—Each candidate will be examined both in writing and orally and also clinically where the nature of the subject admits in the following divisions—viz., first in Botany, Zoology, Physics, and Chemistry, second in Anatomy and Physiology, third, in Materia Medica and Pathology and Forensic Medicine and Public Health, and fourth, in Surgery, Clinical and Operative Surgery, Practice of Medicine and Clinical Medicine, and Midwifery and Gynaecology (Systematic and Clinical).

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery shall be 22 guineas and the proportion of this sum to be paid by a candidate at each division of the examination shall be regulated from time to time by the University Court. The fee to be paid for the degree of Doctor of Medicine shall be 15 guineas and for the degree of Master of Surgery 15 guineas.

The whole medical curriculum can be taken in University College or the first two years in United College.

Professors—Natural Philosophy William Peddie, D.Sc., F.R.S.E. Chemistry Alexander MacKenzie, M.A., Ph.D., Natural History D. Aron W. Thompson, M.A., C.B., Botany Patrick Geddes, F.R.S.E. Anatomy J. Yule Mackay, M.D., LL.D. Physiology E. W. Reid, B.A., D.Sc., M.B., M.R.C.S., F.R.S. Pathology L. R. Sutherland, M.B., C.M. Surgery D. MacEwan, M.D. Medicine Alexander M. Stalker, M.A., M.D. Midwifery: J. A. Kynoch, M.B., F.R.C.P., S. Edin. Materia Medica: C. R. Marshall, M.A., M.D.

United College of St. Andrew and St. Leonard.—Professors—Natural Philosophy A. S. Butler, M.A. Natural History W. C. MacIntosh, M.D., LL.D., F.R.S. Chemistry James C. Irvine, D.Sc., Ph.D. Anatomy David Waterston, M.D., C.M. Physiology Percy T. Herring, M.D.

For further particulars and details as to scholarships and bursaries application should be made to Professor Kynoch, Dean of the Medical Faculty, University College, Dundee.

UNIVERSITY COLLEGE, Dundee.—This College is one of the constituent colleges of the University of St. Andrews. In the medical buildings there are spacious and well-equipped laboratories. The complete medical curriculum can be taken in Dundee. For classes, fees, &c., see under University of St. Andrews.

ROYAL INFIRMARY Dundee.—The Infirmary contains 408 beds including special wards for the Diseases of Women, Children, Eye, Ear, and Throat, Skin, and for Obstetric cases. There is in addition an External Obstetric Department. There were during last year 13 002 out-patients and 532 home (maternity) patients. The Royal Infirmary offers exceptional facilities for practical work to students. Appointments: Six qualified Resident Medical Officers are appointed every six months and one non-resident Obstetric Assistant.

Clinical Clerks and Dressers are attached to the Physicians and Surgeons, and students are appointed as assistants in the Pathological Department. There are in connexion with the clinical courses Tutorial Classes in Medicine and Surgery. Instruction is also given in Practical Pharmacy and Materia Medica and in Practical Dentistry. Further information can be obtained from Dr Fraser, Medical Superintendent.

UNIVERSITY OF ABERDEEN

The University of Aberdeen grants four degrees in Medicine and Surgery—viz., Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Medicine (M.B.), and Bachelor of Surgery (Ch.B.). The two degrees of M.B. and Ch.B. are not conferred separately, and the higher degrees of M.D. and Ch.M. are only granted to holders of the M.B. and Ch.B. degrees.

Degrees of M.B. and Ch.B.—Before commencing his medical studies each student must pass a Preliminary Examination in (1) English, (2) Latin, (3) Mathematics, and (4) Greek, or French, or German. The curriculum for the degrees extends over a period of five years, during which attendance is required in the following subjects: Botany, Zoology, Physics, Chemistry (Systematic and Practical), Anatomy (Systematic and Practical), Physiology (Systematic and Practical), Materia Medica and Therapeutics, Practical Pharmacy, Pathology (Systematic and Practical), Medical Jurisprudence, Public Health, Surgery, Medicine, and Midwifery.

Candidates must attend for at least three years the medical and surgical practice of a recognised hospital, they must have attended courses of at least nine months in clinical medicine and clinical surgery, and have acted as clerk in the medical and dresser in the surgical wards of a hospital. Attendance is required on the practice of a dispensary or the out-practice of a hospital and also on courses in Mental Diseases, Fevers, Ophthalmology, Post-mortem examinations, and other special subjects. The candidate is also required to have been properly instructed in Vaccination and to have attended at least 20 Midwifery cases.

The fee for the degrees of M.B. and Ch.B. amounts to £23 2s.

Besides the Royal Infirmary (270 beds), students have the opportunity of attending the following institutions: City Fever Hospital, Sick Children's Hospital, General Dispensary and Lying-in and Vaccine Institutions, Royal Lunatic Asylum, Ophthalmic Institution, &c.

Degrees of M.D. and Ch.M.—Candidates for either of these degrees must already hold the degrees of M.B. and Ch.B. of Aberdeen. A thesis has to be presented for approval by the Medical Faculty and an examination has to be passed in Clinical Medicine or Clinical Surgery, as the case may be.

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom, after a special examination.

Application for further information should be addressed to the Secretary of the Medical Faculty.

Professors—Physics C. Niven M.A., D.Sc., F.R.S. Physiology J. A. MacWilliam, M.D. Medicine Ashley W. Mackintosh, M.D. Chemistry Fred Soddy, M.A., F.R.S. Anatomy R. W. Reid, M.D., F.R.C.S. Surgery John Marnoch, C.V.O., M.B., C.M. Materia Medica J. T. Cash, M.D., LL.D., F.R.S. Midwifery Robert G. McKerron, M.D. Forensic Medicine Matthew Hay, M.D., LL.D. Botany J. W. H. Trail, M.D., F.R.S. Pathology Theodore Shennan, M.D. Natural History J. Arthur Thomson, M.A., LL.D.

Scholarships and Prizes—In the Faculty of Medicine of the University of Aberdeen there are the following Bursaries, Scholarships, and Prizes—Bursaries about 15 Bursaries (competition and presentation) are open each year, of £15 to £30 per annum in value, most of them being tenable for three years, certain other Bursaries are not confined to the Faculty of Medicine, but may be held by Arts Students. Scholarships five Post-Graduate Scholarships value £36 to £160 per annum. Prizes and Medals 13 Gold Medals and Prizes for proficiency in special departments &c.

Clinical Instruction is given in the Aberdeen Royal Infirmary (270 beds) by the physicians and surgeon to the staff many of whom are in the list of professors and other lecturers and demonstrators.

ABERDEEN ROYAL ASYLUM—Contains, with hospital attached to main institution and agricultural branch, 986 beds. Medical Superintendent Dr William Red. Assistant Physicians Dr A. W. H. Oheyne, Mr Arthur Y. Milne, and Mr Arthur P. Spark. Clerk Treasurer, and Factor Mr A. Scott Finnie, 343, Union street, Aberdeen. Clinical instruction is given to students during three months in summer.

SCOTTISH MEDICAL CORPORATIONS GRANTING DIPLOMAS

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH
BURGH ROYAL COLLEGE OF SURGEONS
OF EDINBURGH, ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

These Colleges have made arrangements by which, after one series of examinations, held in Edinburgh or Glasgow or both, the student may obtain the diplomas of the three Bodies.

The three Bodies grant their Single Licences only to candidates who already possess legal qualifications in Medicine or Surgery. Copies of the Regulations for the Single Licence of any of the Bodies may be had on application to the respective secretaries.

Professional Education—The candidate must produce certificates or other satisfactory evidence of having attended the following separate and distinct courses of instruction: Physics, three months; Elementary Biology three months; Chemistry, six months; Practical or Analytical Chemistry, three months; Anatomy, during at least six months; Practical Anatomy, twelve months; Physiology with Histology, six months; Materia Medica, three months; Pathology (including Practical Pathology), nine months; Practice of Medicine, six months; Clinical Medicine, nine months; Principles and Practice of Surgery, six months; Clinical Surgery, nine months; Midwifery, three months; Gynaecology one course of not less than 13 meetings; Diseases of Children, one course of not less than 13 meetings; Medical Jurisprudence and Public Health, three months. The certified attendance on lectures, demonstrations, and practical work must not be less than three-fourths of the total number of roll calls. Every student undergoes a course of Practical Midwifery, but before attending at labours he is required to attend a course of lectures on Surgery and Midwifery and to hold the offices of Clinical Medical Clerk and Surgical Dresser. He must also attend for two and a half months instruction in Practical Pharmacy, the certificate to be signed by the teacher, who must be a member of the Pharmaceutical Society of Great Britain, or the superintendent of the laboratory of a public hospital or dispensary, or a registered practitioner who dispenses medicines to his patients, or a teacher of a class of Practical Pharmacy.

The student must attend for 27 months the Medical and Surgical practice of a public general hospital containing on an average at least 80 patients available for clinical instruction and possessing distinct staffs of physicians and of surgeons. He must act as Surgical Dresser and Medical Clinical Clerk for not less than three months in the wards in each case, and receive practical instruction in administration of anaesthetics. He must attend for six months the practice of a public dispensary especially recognised by any of the above authorities, or the out-patient practice of a recognised general hospital or act for six months as pupil to a registered practitioner who either holds such a public appointment, or has such opportunities of imparting practical knowledge as shall be satisfactory to the cooperating authorities, this attendance should be made after the student has passed the First and Second examinations.

Candidates are also required to attend the following courses: Diseases and Injuries of the Eye, three months; Insanity, three months; Infectious Diseases three months; Gynaecology, three months; Diseases of Children three months.

The curriculum lasts for five years, the fifth year being devoted to clinical work.

There are four professional examinations—
First Examination includes Physics, Chemistry, and Elementary Biology.

Second Examination includes Anatomy and Physiology and Histology, and candidates may be admitted to this examination at the end of the second year of medical study.

Third Examination includes Pathology and Materia Medica and Pharmacology.

Final Examination—The Final examination shall not be taken earlier than the end of the fifth year of study and shall embrace the following subjects—Medicine, including Therapeutics, Medical Anatomy, and Clinical Medicine, Surgery, including Surgical Anatomy, Clinical Surgery, and Diseases and Injuries of the Eye, Midwifery and Diseases of Women, and, if not passed previously, Medical Jurisprudence and Public Health, but it is optional to candidates who have passed the Third Examination to be limited to the subject of Medical Jurisprudence and Public Health on lodging certificates of having attended a necessary course in that subject at any time, but the subjects of Medicine, Surgery, and Midwifery shall be taken together at any time after the end of the fifth Inter Session, provided that a period of 24 months has elapsed since passing the Second Examination. All candidates shall be subjected, in addition to the written and oral examinations, to clinical examinations in Medicine and Surgery which shall include the Examination of Patients, Physical Diagnosis, the Clinical use of the Microscope, Examination of the Urine and Urinary Deposits, Surgical Appliances, Bandages, Surface Markings, &c. The fees payable for the Final Examination shall be—for the whole examination £15 for re-entry after rejection, £5 and for the subjects of Medical Jurisprudence and Public Health taken separately, £5, with £3 for re-entry in that subject.

There are six periods of examination annually, four in Edinburgh and two in Glasgow. The Registrar in Edinburgh is Mr D. L. Eadie, 50, George-square, and the Registrar in Glasgow, Mr Walter Hurst, 242 St Vincent-street, to whom fees and certificates must be sent for the respective examinations, and from whom further particulars concerning fees can be obtained.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH THE MEMBERSHIP AND FELLOWSHIP

In addition to the diplomas granted by the Scottish Conjoint Board the Royal College of Physicians grants its Single Licence to candidates already possessing legal qualifications for professional practice.

The Royal College of Physicians of Edinburgh grants a *Membership* and a *Fellowship*.

Membership—A candidate who must be a Licentiate of a British or Irish College of Physicians, or a graduate of a British or Irish University and 24 years of age is examined in medicine therapeutics and in any branch of the departments of medicine specially professed, such as general pathology, psychology, public health, obstetrics, gynaecology, diseases of children, tropical medicine or medical jurisprudence. The fee for the Membership is £38 15s 15 guineas of which will be returned to any successful candidate who was already a Licentiate of the College at the time of qualifying for the Membership.

Fellowship—The Fellows are selected from the ranks of the Members. They must be 25 years of age. The fee is £64 18s.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH THE FELLOWSHIP

The Royal College of Surgeons of Edinburgh also admits to the examination for its Single Licence any candidates who hold a Diploma in Medicine of any British, Indian, or Colonial University or of any British or Colonial College of Physicians or of the Society of Apothecaries of London or Apothecaries Hall Dublin granted under the provisions of the Medical Act 1886 whose preliminary examination and course of professional study is proved to be sufficient to fulfil the requirements of the College, or to those who have passed a full examination for any of the above. Female practitioners are now admitted to the Licence of the College but not to the Fellowship and the regulations for the Licence apply to practitioners of either sex.

The Royal College of Surgeons of Edinburgh grants a diploma of Fellowship after examination to the holders of

the surgical degrees or diplomas of such British examining bodies, as well as of the holders of such surgical degrees of the Universities of Canada, Australia, New Zealand, and the Indian Empire as are recognised by the College.

The Fellowship—Candidates for the examination must be 25 years of age and must have been engaged in practice for at least two years. The examination is of a practical nature, partly written and partly *viva voce*, and must include surgery and surgical anatomy, operative surgery, and clinical practice. One optional subject must also be taken, the range of these specialisms covering nearly every branch of medicine. The fee to be paid on entering for examination for Fellowship is £45, £10 of which is remitted to those who already hold the Licentiate of the College. Candidates rejected at the examination obtain repayment of fee less £10 retained for examination expenses. One month's notice of intention to present himself for examination must be given by the candidate to Mr D. L. Eadie, 50, George-square, Edinburgh, clerk to the College, together with credentials signed by two Fellows of the College one of whom must be a resident in Edinburgh, unless a special application be made to the President and the Council of the College.

THE ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

Like the preceding corporations, the Royal Faculty of Physicians and Surgeons of Glasgow grants a Fellowship and a Licence to be held as separate qualifications.

Fellowship—The Fellowship of the Faculty is granted after examination in medicine or surgery, together with an optional subject, which may be anatomy or physiology or be selected from any special branch of medicine or surgery, or in one subject to medical practitioners who serve in the present war. 14 days' notice must be given by the candidate of his intention to present himself to Mr Walter Hurst, the Faculty Hall 242, St Vincent-street, Glasgow. The fee for the Fellowship is £30, £10 of which sum are returned to any successful candidate who already holds the Licence of the Faculty. An additional sum of £20 is required in the case of candidates resident within seven miles of Glasgow. In certain circumstances Fellows may be elected as a mark of distinction.

Licence—The Licence of the Royal Faculty is granted as a separate qualification to qualified practitioners in Medicine after examination in surgery, including surgical anatomy and clinical surgery. The fee is 15 guineas.

SCOTTISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS

The hospitals which are recognised by the Scottish Conjoint Board, as places where professional study for their diplomas can be pursued are all those institutions which feed the medical faculties of the universities. In addition the Scottish Boards recognise all the places which are recognised by the English Conjoint Board (see p 385) and the Irish Conjoint Board (see p 402).

III—IRELAND

THE UNIVERSITIES

UNIVERSITY OF DUBLIN, TRINITY COLLEGE (SCHOOL OF PHYSIO)

Matriculation.—All students intending to join the School of Physic must pass a matriculation examination. University students take the Entrance of Trinity College and a Junior Freshman Term or a special Medical Preliminary, External Students, any examination recognised by the General Medical Council. The winter courses begin on Oct 2nd.

Degrees in Medicine (M.B.) Surgery (B.Ch.), and Midwifery (B.A.O.).—Candidates for these degrees must be of B.A. standing and must be for at least five academic years on the books of the Medical School, reckoned from the date of matriculation. The Arts course may be taken concurrently with the Medical course, and the B.A. degree need not be taken before the final medical examinations, but the Medical degrees are not conferred without the Arts degree. The following courses must be attended

(1) Lectures—Systematic, Descriptive and Applied Anatomy, Chemistry and Practical Chemistry Surgery and Operative Surgery, Histology, Botany, Zoology, Physics and Practical Physics, Physiology and Practical Physiology, Practice of Medicine, Midwifery, Pathology, Materia Medica and Therapeutics, Medical Jurisprudence and Hygiene, (2) three courses of nine months' attendance on the Clinical Lectures of Sir Patrick Dun's or other recognised Hospital, (3) Practical Vaccination, one month's instruction, (4) Mental Disease, three months, (5) Practical Midwifery with Clinical Lectures including not less than 30 cases, six months, (6) Ophthalmic Surgery, three months. Three groups of examinations have to be passed Preliminary Scientific Examination, including Physics and Chemistry, Botany and Zoology The Intermediate Medical Part I including Anatomy and Physiology The Intermediate Medical, Part II, including Applied Anatomy and Applied Physiology, and the Final Examination, which is divided into Part I, Materia Medica, Hygiene and Jurisprudence, and Pathology, and Part II, Medicine, including Clinical Surgery, Midwifery Gynaecology, Mental Diseases, Operations, and Clinical Ophthalmology Part I may be passed in the fourth year and Part II completed at the end of the fifth year

Doctor in Medicine—A Doctor in Medicine must have passed all the qualifying examinations and must be a B.A. of three years' standing. He must also read a thesis before the Regius Professor of Physic

Master in Surgery—A Master in Surgery must be a Bachelor in Surgery of the University of Dublin or not less than three years' standing, and must produce satisfactory evidence of having been engaged for not less than two years from the date of his registration in the study, or study and practice, of his profession. He must then pass a special examination.

Master in Obstetric Science—A Master in Obstetric Science must be fully qualified and produce a certificate of having attended a summer course in Obstetric Medicine and Surgery. He is then required to pass a special examination

University Diplomas—Candidates for the diplomas in Medicine, Surgery, or Obstetric Science must be matriculated in Medicine and must have completed two years in Arts and five years in Medical Studies. The Course and Examination necessary for the diplomas are the same as for the degrees. A diploma in Medicine, Surgery, and Midwifery is a registrable qualification conferred upon candidates who have completed a full five years' course in Medicine and two years in Arts. A diplomate, on completing his course in Arts and proceeding to the degree of B.A., may become a Bachelor by paying the degree fees

Bachelor in Dental Science and Master in Dental Science—The regulations under which these degrees are awarded can be obtained by application to the Registrar of the School of Physic

Professors and Lecturers—Regius Professor of Physic James Little M.D. LL.D. Regius Professor of Surgery Edward H. Taylor, M.D., F.R.C.S.I. University Professor of Anatomy and Surgery Andrew Francis Dixon, M.B., Sc.D. University Professor of Chemistry Sydney Young, Sc.D. F.R.S. University Professor of Botany Henry H. Dixon, Sc.D., F.R.S. Erasmus Smith's Professor of Natural Philosophy William E. Thrift, M.A., F.T.O.D. Professor of Surgery Thomas E. Gordon M.B., F.R.C.S.I. Professor of Zoology and Comparative Anatomy H. W. Mackintosh M.A. King's Professor of Practice of Medicine James Craig, M.D. King's Professor of Materia Medica and Pharmacy Walter G. Smith M.D. King's Professor of Institutes of Medicine W. H. Thompson, M.D., Sc.D. King's Professor of Midwifery T. Henry Wilson F.R.C.P.I. Honorary Professor of Laryngology and Otology Sir Robert H. Woods M.D., F.R.C.S.I. Lecturer in Medical Jurisprudence and Hygiene Henry T. Bewley M.D. Lecturer in Pathology Alexander C. O'Sullivan, M.D. F.T.O.D. Lecturer in Dental Surgery and Pathology A. W. W. Baker, M.D. M.Dent.Sc. Lecturer in Dental Mechanics Joseph Cockburn L.D.S. Lecturer in Orthodontia E. Sheldon Friel M.Dent.Sc. Lecturer in Anaesthetics T. Percy C. Kirkpatrick, M.D.

Clinical instruction—The hospital facilities for clinical instruction available in Dublin will be described below

THE NATIONAL UNIVERSITY OF IRELAND

Matriculation—All students intending to proceed to the medical degree of the University of Ireland must pass a matriculation examination, the examination taking place in September in Dublin and at certain local centres. All students must pass in five subjects. All students must pass in the following subjects¹ except students not born in Ireland, and other students whose home residence shall have been outside Ireland during the three years immediately preceding their matriculation, but all such students will be expected to attend a course of instruction in Irish Literature and History prior to obtaining any degree in the University—1. Irish 2. Latin or Greek 3. French, German, Italian, Spanish, Welsh, Dutch or any other language approved by the Senate. 4. English 5. Mathematics or Natural Philosophy² 6. English, Latin, Greek, French, German, Welsh, Spanish, Italian or any other modern language approved by the Senate, History and Geography, Mathematics, Natural Philosophy, or Physics³ as an alternative, Chemistry, Botany, and for women candidates only, Physiology, and Hygiene. Candidates who under the regulations are exempted from the necessity of presenting Irish as one of their subjects may present as their fifth subject either a second language or a second science subject. Students entering for degrees in Medicine or Dentistry if already registered by the General Medical Council, may be accepted as matriculated students of the Faculty of Medicine on passing the matriculation examination in any faculty of the University

The medical degrees granted are—

M.B., B.Ch., and B.A.O., and M.D., M.Ch., and M.A.O.—Printed forms of application for admission to any medical examination may be had from "The Registrar, The National University of Ireland, Dublin"

The Constituent Colleges of the National University of Ireland at which the full curriculum for medical degrees can be obtained are University College, Dublin, University College, Cork, and University College, Galway

UNIVERSITY COLLEGE, DUBLIN—The University and the College were created by the Irish University Act, 1908, and by Charters issued in December, 1908. Former students of the Cecilia street School of Medicine who graduated in the Royal University may become graduate members of the new College. The constitution of the College, like that of the Constituent Colleges of Cork and Galway, provides for a governing body, an academic council consisting of professors and co-opted lecturers, a body of graduate members and a body of student members matriculated in the University. The first professors and lecturers were appointed by the Dublin Commissioners Irish Universities Act 1908

Matriculation—Almost all the students of the College are matriculated students of the National University of Ireland

University Examinations in Medicine—The First Examination includes Physics, Chemistry, Botany, and Zoology. The examination may be taken in two parts. Part I, Physics and Chemistry, Part II, Botany and Zoology

¹ The Senate has directed that candidates who presented themselves for the Matriculation Examination and who passed in certain subjects in 1912 or any previous year may when presenting themselves in 1917 in the remaining subjects necessary to complete the examination select such completing subjects in accordance with the regulations as to groups of subjects which were in force in 1912. Such candidates will not be obliged to present themselves for examination in Irish. Such candidates however while they may select the completing subjects as above must present themselves for examination in these subjects on the courses prescribed in each by the Regulations in 1917. Candidates who presented themselves for the Matriculation Examination and who passed in certain subjects in 1913 when presenting themselves in 1917 in the remaining subjects necessary to complete the examination must select such completing subjects in accordance with the regulations as to groups of subjects which were in force in 1913. The courses in such completing subjects will be the courses prescribed in those subjects respectively for 1917

² Certificates of having passed in Chemistry or Physics at the Examinations of the Intermediate Education Board will be accepted only if the Honour Examination of the third or fourth year course in these respective subjects has been passed. (A pass on the Honour Course will be accepted.) Students desiring to present Pass Chemistry or Pass Physics must pass an examination in these subjects at the Matriculation Examination of the University. A pass in Chemistry or Physics at the Examination of the Intermediate Education Board will not be accepted as exempting from Mathematics at the Matriculation Examination of the University

³ A candidate who takes Natural Philosophy in Group 5 cannot take Physics in Group 6

Honours may be obtained only when both parts are taken as one examination. The Second Examination includes Anatomy and Physiology. Both must be passed at the same time. The Third Examination includes Pathology, Medical Jurisprudence and Hygiene, and Materia Medica.

Degrees of M.B., B.Ch., and B.A.O.—The Examination in Medicine, Midwifery, Surgery, and Ophthalmology includes both the theoretical and the clinical branches. No student can enter for the M.B., B.Ch., or B.A.O. until the end of the fifth year when the curriculum has been completed. The course of study is as follows:—First year—Winter Anatomy and Practical Anatomy (required for the Second Examination).^{*} Chemistry, Practical Chemistry, and Experimental Physics (with Laboratory Course). Summer Zoology, Practical Zoology, Botany, and Practical Botany. Second year—Winter Anatomy, Practical Anatomy, Physiology, and Practical Physiology (physical and chemical). Summer Anatomy, Practical Anatomy, Physiology and Practical Histology. Third year—Winter Pathology, Surgery or Medicine, Hygiene, Medical Jurisprudence and Practical Pharmacy. Summer Materia Medica and Therapeutics, and Practical Pathology. Candidates are also required to attend a General Hospital for nine months (winter and summer). Fourth year, or fourth and fifth years—Winter Medicine or Surgery (the subject to be that not taken in the third year), and Midwifery and Gynaecology. Summer Operative Surgery, Applied Anatomy, and Ophthalmology and Otology. Candidates are also required to attend a General Hospital for nine months (winter and summer) and to take instruction in Vaccination, and three months Fever Hospital. Fifth year—If the Academic (Collegeiate) Courses are taken as above, the Courses of the fifth year will be the following: Hospital Attendance, General Hospital, nine months, Clinical Ophthalmology and Otology three months, Practical Midwifery and Gynaecology, six months, Mental Diseases, to be attended at a Lunatic Asylum three months. (Note—Practical Midwifery and Gynaecology may be taken in the fourth year after the Systematic Course of Midwifery but it must not be taken concurrently with the period of attendance at Fever Hospital.) The degree of M.D. may be obtained either by examination or on published work.

Dean of the Faculty (of the College). Professor McLoughlin. *Professors.*—Anatomy Edward Patrick McLoughlin, B.A. M.B., B.Ch., B.A.O. Physiology Bertram James Collingwood, B.A., M.D. Zoology George Sigerson, M.D. Chemistry Hugh Ryan, M.A., D.Sc. Physics John A. McClelland, M.A., D.Sc. F.R.S. Pathology and Bacteriology Edmund J. McWeeney, M.A., M.D., D.Ph. F.R.O.P. Irel. Medicine Joseph F. O'Carroll, M.D. F.R.C.P. Irel. Surgery John S. McArdle, M.Ch. F.R.O.S. Irel. Midwifery and Gynaecology Alfred J. Smith, M.B. F.R.O.S. Irel. Materia Medica and Therapeutics Martin Dempsey, B.A., M.D. F.R.O.P. Irel. Hygiene and Medical Jurisprudence J. N. Meenan, M.B., B.Ch., B.A.O., D.Ph. Botany J. Bayley Butler, M.A., M.B., B.Ch., B.A.O. and Louis Werner, M.B. F.R.O.S. Irel. Dental Surgery E. Sheridan, F.R.O.S. Irel. L.D.S. Dental Mechanics J. L. Potter, L.D.S.

Assistants and Demonstrators.—Anatomy Dr H. Barniville, Dr C. J. MacAuley, Mr H. S. Meade, F.R.C.S.I. and Dr W. Doolin. Chemistry Mr G. Ebrill, B.A. and Mr T. Dillon, D.Sc. Medicine Dr J. F. O'Carroll, Pathology and Bacteriology Dr T. O'Farrell and Dr W. D. O'Kelly. Pharmacy Dr M. Hayes. Physics Mr J. Nolan, M.Sc. and John J. Dowling, M.A. Surgery Dr A. Blarney. Physiology Dr James M. O'Connor.

Fees.—The fees for Courses are similar to those of the other of Dublin Medical Schools.

Information concerning these and the numerous scholarships and exhibitions of the College can be obtained from the Dean.

UNIVERSITY COLLEGE CORK. THE SCHOOL OF MEDICINE.—The building is provided with a very large, well ventilated dissecting room supplied with electric light with physiological, toxicological, pathological and pharmaceutical laboratories, materia medica anatomical and pathological museums as well as a collection of surgical and obstetrical

instruments and appliances. There are well appointed physical, chemical, and biological laboratories, and a large natural history museum in the adjoining building, and part of the College ground is laid out as a botanical garden. The plant houses are well filled with plants and are open to the students in the class of Botany. The Library contains over 50,000 volumes and is open daily during term time to students. The Medical Museum occupies a large room erected at the northern end of the medical buildings. There are Students Clubs for men and women students of the College and various athletic clubs the last of these holding a public meeting once in each year in the Mardyke grounds.

Dean of the Faculty.—Professor A. E. Moore, M.B., B.Ch., B.A.O.

Professors.—Anatomy D. P. Fitzgerald, M.B., B.Ch., Botany H. A. Cummins, M.D., C.M.G. (Major, R.A.M.C.). Chemistry A. E. Dixon, M.D. Experimental Physics—W. Bergin, M.A. Materia Medica John Dundon, M.B., B.Ch., B.A.O., F.R.O.S. Eng., F.R.O.S. Irel. Medicine W. Ashley Cummins, M.D., M.Ch. Obstetrics and Gynaecology H. Corby, B.A., M.D., M.Ch. Pathology A. E. Moore, M.B., B.Ch., B.A.O. Physiology D. T. Barry, M.D., F.R.O.S. Surgery C. Yelverton Pearson, M.D., M.Ch., F.R.O.S. Zoology Marcus Hartog, M.A., D.Sc. F.L.S. F.R.H.S. Hygiene Mr D. D. Donovan. Medical Jurisprudence Dr P. T. O'Sullivan. Ophthalmology Dr A. W. Sandford.

Lecturer.—Mental Diseases Dr J. J. Fitzgerald.

Demonstrators.—Anatomy Dr W. F. O'Connor. Chemistry Mr J. Taylor, M.Sc., and Dr J. L. McKee, Ph.D. Experimental Physics Mr P. Belas, B.A. Pathology Dr W. Magner. Physiology Mr J. M. O'Donovan, B.Sc. Surgery Dr C. B. Pearson. Zoology Miss B. E. Duke, B.Sc.

All students who have been admitted as matriculated students are required to attend before the President and sign the Roll of Matriculated Students. Students who may be candidates for degrees in the National University of Ireland must have passed the Matriculation Examination of that University or other recognised examination, and medical students must have passed a preliminary examination recognised by the General Medical Council. Candidates will be examined in Irish, Greek, or French or German, Latin, History, Geography, English and Mathematics.

Admission of Medical Students.—Students in the Faculty of Medicine who have passed the First Professional Examination of the Conjoint Examinations of the Royal College of Physicians and the Royal College of Surgeons in Ireland, or of the Royal College of Physicians and Royal College of Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow, or of the Royal College of Physicians, London and Royal College of Surgeons, England, may be admitted to the rank of second year students on making application to the Council and submitting a certificate of having passed the examination. Similarly students who have passed the Second Professional Examination of the same Colleges may be admitted to the rank of third year students, and those who have passed the Third Professional Examination of the Dublin Colleges, or of the Edinburgh Colleges and Glasgow Faculties, may be admitted to the rank of fourth year students.

Residence of Students.—There is no accommodation for the residence of students within the College, but students not living at home, or with relatives or friends, sanctioned by their parents or guardians are required to live in a hostel or in recognised lodgings, a list of which can be obtained from the Secretary. All students are required to register their addresses each session in the book kept for that purpose in the hall porters' office, and to notify immediately to the Registrar any change of address during the session. The Honan Hostel adjoining the College is equipped by private endowment. A number of sets of rooms together with recreation and common rooms, are provided for lay students who may desire to live there. For full particulars apply to the Warden. The Ursuline Convent their Secondary School for Catholic women students.

Clinical Instruction.—Students may attend the South Infirmary, Cork North Charitable Infirmary, the Mercy Hospital, the Cork District Lunatic Asylum, the Victoria Hospital for Diseases of Women and Children, the County Living Hospital, the Cork Maternity, the Cork Fever Hospital, the Cork District Hospital, and the Cork Ear, Eye, and Throat Hospital.

^{*} These courses are not required for the First Examination in Medicine but must be taken in the first year to permit a candidate to qualify for admission to the Second Examination in Medicine at the end of the second year.

Complete information with regard to class fees, scholarships, and prizes can be obtained from the Dean of the College

South Infirmary and County of Cork General Hospital (100 beds)—Staff Consulting Physician Dr P J O'Brien Physicians Dr P T O'Sullivan and Dr Norman I Townsend Surgeons Dr H R. Townsend, Dr T Gelston Atkins, and Dr Henry Corby Ophthalmic Surgeon Dr A W Sandford Physicians for Extern Patients Dr E W Allsom and Dr E V Cantillon Surgeon for Extern Patients Dr R P Orosbie Anaesthetist Dr M V Shanahan Radiologist Dr G Hegarty Pathologist Dr A. E. Moore. House Surgeon Dr W P Lebone House Physician Dr J O Saunders Dentist Mr T O Butterfield. Honorary Secretary Dr N I Townsend. Clinical instruction is given daily in the wards. Special instruction on Ophthalmic Surgery and Diseases of Women and Children will be given in the special wards for such cases. Fee for perpetual ticket, £22 1s, for nine months, £9 9s, for six months, £6 6s, for three months, £3 3s. Two resident pupils will be appointed by competitive examination. Clinical prizes will be given by the staff at the close of the session.

Cork North Charitable Infirmary and County and City of Cork General Hospital (112 beds)—Physicians Mr D D Donovan and Dr Edward Magner Surgeons Mr O Y Pearson, Mr John Dundon, Mr N H Hobart, and Mr D J O'Mahony Assistant Physician Mr R. B. Dalton Assistant Surgeon Mr Richard P Byrne Second Assistant Surgeon Mr D F Hegarty Resident Surgeon John Higgins Resident Physician (Vacant) Pathologist Dr W Magner Radiologist Dr C B Pearson Anaesthetist Mr D M Donovan Surgeon Dentist Mr William Pericho Dispensing Chemist Mr M Tucker Honorary Secretary Mr R B Dalton. Clinical instruction is given daily in the wards by the physicians and surgeons. Special instruction is given to Junior Students on two days weekly. Fee for perpetual ticket, £22 1s, for 12 or nine months, £9 9s, for six months, £5 5s, and for three months, £3 3s. Two resident pupils are appointed quarterly by the medical staff. All resident pupils are required to be registered pupils of the Hospital. There is a special department for treatment of the eye, ear, throat, and nose under the charge of Mr J Bowring Horgan, and a Special Dental Department (Secretary, I Scher, L D S).

Mercy Hospital *—Staff Consulting Physician Dr P J O'Brien Consulting Surgeon Dr J J Cotter Consulting Ophthalmic Surgeon Dr J J McMahon Physicians Dr C Cantillon and Dr D J O'Connor Surgeons Mr J Glusani and Mr J Dundon. Ophthalmic Surgeon Mr J M Browne Surgeon Dentist Mr H O'Keefe. Resident Surgeon Dr O'Brien Anaesthetist and Radiographer Mr Walter Rahilly Pathologist Dr M A Shinkwin, two resident students. This hospital contains 85 beds for medical and surgical cases. There is also a daily extern for medical and surgical cases, as well as for diseases of the eye, ear, and throat. Extern medical attendances, 2791, surgical attendances, 861, ophthalmic attendances and dental, 4541, intern patients, 1128. Major operations 254, minor operations, 567. Honorary Secretary to the Staff Dr James Browne.

Cork District Lunatic Asylum—Psychological Medicine. A course of Clinical Lectures on Mental Disease and Allied Neuroses will be delivered in the Cork District Lunatic Asylum on Mondays and Thursdays commencing the first Thursday in May, by the Resident Medical Superintendent. All students wishing to enter for the course are expected to attend at the Asylum at 2.30 P.M. on that day. All information may be had at the Asylum from Dr James J Fitzgerald resident medical superintendent.

Victoria Hospital (Cork)—Honorary Staff Dr Ashley Cummins, Dr O Yelverton Pearson, Dr P Lee, Dr Hobart, and Dr C B Pearson. Lady Superintendent Mrs George Armstrong. There are 75 beds. Clinical instruction on Diseases Peculiar to Children is given. The extern department is open daily at 9.30.

County and City of Cork Lying in Hospital (Edinville, Western road, founded 1788)—Staff Honorary Consulting Physicians Dr W E Ashley Cummins and Dr D D Donovan Honorary Obstetric Surgeon Mr O Yelverton Pearson Physicians Dr N H Hobart, Dr

Lucy E Smith, Dr Daniel J O'Connor, and Dr P J O'Brien Assistant Physicians Dr E V Cantillon and Dr C B Pearson. This hospital contains 20 beds. Fee for six months' attendance, including clinical lectures, £3 3s. For further particulars apply to N H Hobart, honorary secretary to staff.

Cork Maternity (Batchelors Quay)—Staff Consulting Obstetric Physicians Dr T Gelston Atkins and Dr Henry Corby Obstetric Physicians Dr John Booth, Dr Michael Cagney, and Dr Walter Rahilly. Three resident pupils are taken into the Maternity. Poor women are attended at their own homes. Clinical lectures are delivered during the session. There is an extern department for the treatment of women's and children's diseases. Fee for attendance at clinical lectures and certificate, £3 3s. Honorary secretary to staff, Dr Henry Corby.

Cork Fever Hospital—Staff Ordinary Physicians Dr D J Flynn and Dr T Callaghan Extraordinary Physician Dr D Murphy Resident Medical Officer and Registrar Dr A G Sutton. Upwards of 500 cases of various forms of fever and zymotic disease are treated yearly in this hospital. The Resident Medical Officer gives instruction in Practical Pharmacy, a certificate of which is necessary for the National University and Colleges of Physicians and Surgeons of Edinburgh.

Cork District Hospital (Douglas-road, 1200 beds)—Staff Dr W E Ashley Cummins (Professor of Medicine, University College, Cork, Examiner in Medicine, National University of Ireland), Dr J Glusani, Mr D Morrissey, and Mr James T O'Connor Resident Medical Officers Dr O Mollane and Dr M Sexton. This hospital includes special buildings for fever and other infectious diseases (100 beds), for children's diseases (100 beds), and a Lock hospital, the only one in the South of Ireland (80 beds). It affords an extensive field for the study of all classes of diseases, acute and chronic, including special departments for gynaecology and diseases of the skin and nervous system. The physicians and surgeons visit the hospitals every morning at 10 o'clock. Lectures and clinical instruction are given daily in the wards by the physicians and surgeons. Further particulars may be obtained from Dr W E Ashley Cummins 17 St. Patrick's place, honorary secretary, medical staff.

Cork Eye, Ear, and Throat Hospital (Western road)—Staff Visiting Surgeon Dr Arthur W Sandford Assistant Surgeons Dr T H D Townsend and Dr J M Browne Consulting Physician Dr W E Ashley Cummins Consulting Surgeon Dr H N Hobart House Surgeon Dr B J O'Connor. This hospital is open to students attending the University College and others. Certificates of attendance for three or six months can be obtained. The hospital contains 35 beds. Over 4000 cases are treated during the year. Clinical instruction is given to students attending the hospital with demonstrations on the use of special instruments. A course of Lectures on Ophthalmic Surgery is delivered during the session. For further information apply to Dr Arthur Sandford, 13, St. Patrick's place, Cork.

UNIVERSITY COLLEGE, GALWAY SCHOOL OF MEDICINE—The College contains well lighted and ventilated dissecting room and anatomical lecture theatre, physiological, pathological, pharmaceutical, chemical, and physical laboratories, anatomical, pathological, gynaecological, and materia medica museums, as well as a large natural history and geological museum and an extensive library in which students can read and from which they can borrow books. There are 14 Entrance Scholarships, value £30 and £25 each, for which Medical Students compete with other Students on the Entrance Course. In the Second, Third, and Fourth Years two Scholarships in each year, value £25 each are reserved for Medical Students in the Professorial Course. There are extensive grounds, a portion of which is occupied by a Botanic Garden and a portion is at the disposal of the College Athletic Union. There are several student societies in the College, including a Biological Society. There are abundant facilities for research and Post-graduate work in the Chemistry, Physiology, and Pathology departments. There are ample facilities for female students. Further information can be obtained from the Registrar of the College.

Professors—Natural Philosophy A. Anderson M.A., LL.D. Chemistry A. Senior, Ph.D. Natural History

* No returns.

J Mangan, M.A. Anatomy and Physiology J P Pye, M.D., D.Sc. Medicine R. B. Mahon, M.D. Surgery W W Brereton, L.R.O.S.I. Materia Medica N W Colahan, M.D. Midwifery R. J. Kinkead, M.D. Pathology T Walsh, B.A., M.D., D.P.H.

Clinical Instruction is given in the Galway Hospital and in the Galway Union and Fever Hospitals, containing on an average 200 patients

Galway County Hospital (60 beds)—Founded by Act of Parliament Physicians Professor R J Kinkead and Professor R B Mahon. Surgeons Professor J P Pye, Professor N W Colahan, and Professor W W Brereton Gynaecologist Professor Kinkead Pathologist Professor Walsh Assistant Surgeon Dr M J O'Malley Clerk Mr S J Leonard

Galway Union and Fever Hospitals (150 beds)—A new Fever Hospital has just been built A prospectus giving details of the courses of study and examination for degrees and of the subjects for public and private foundation scholarships may be had on application

QUEEN'S UNIVERSITY OF BELFAST

There are six degrees in the Faculty of Medicine of the University—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (B.Ch.), Bachelor of Obstetrics (B.A.O.), Doctor of Medicine (M.D.), Master of Surgery (M.Ch.), and Master of Obstetrics (M.A.O.) The University also grants a Diploma in Public Health, particulars of which will be found in the University Calendar The degrees of M.B., B.Ch. and B.A.O. are the primary degrees in the Faculty of Medicine, and are conferred at the same time and after the same course of study No student is admitted to the final examination for these degrees until he has shown (1) that he is a matriculated student of the University, (2) that he has completed the prescribed course of study in the Faculty of Medicine extending over a period of not less than five academic years from the date of his registration as a student of Medicine by the General Council of Medical Education and Registration of the United Kingdom, (3) that he has passed the several examinations prescribed, (4) that he has attended in the University during three academic years at least the courses of study prescribed for such degrees (the Senate may accept, for not more than two academic years of the required five, courses of study pursued in any other University or School of Medicine approved by the Senate), and (5) that he has attained the age of 21 years. Every candidate for admission as a matriculated student of the University shall pass such Matriculation Examination or fulfil such other test of fitness as may be prescribed by the Senate which may prescribe the conditions under which students who have passed the Matriculation or Entrance Examination of any other University or College approved for that purpose (or who have fulfilled such other test of fitness as may be prescribed) may be exempted from passing the Matriculation Examination of the University For information as to Scholarships and Prizes inquiry should be made of the Dean of the Faculty of Medicine of the University

Primary Degrees of M.B., B.Ch., B.A.O.—All candidates for these degrees must satisfy the examiners in the subjects of four examinations known as the First, Second, Third, and Fourth Medical Examinations respectively

The First Medical Examination—The subjects of this examination are Chemistry (Inorganic and Organic), Experimental and Practical Physics, Botany and Zoology, and Practical Botany and Zoology The examination will be divided into two parts which may be taken separately I Chemistry Practical Chemistry and Experimental Physics (including laboratory work), II Botany and Zoology (including laboratory work)

The Second Medical Examination—The subjects are Anatomy and Practical Anatomy, Physiology and Practical Physiology Candidates who have previously passed the First Medical Examination may present themselves for this examination at the close of their second year

The Third Medical Examination—The subjects are (1) Pathology and Practical Pathology, (2) Materia Medica Pharmacology and Therapeutics, (3) Medical Jurisprudence, (4) Hygiene Candidates who have previously passed the Second Medical Examination may present themselves for this examination at the close of the third year Attendance on a course in any subject of the Third

Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the First Medical Examination

The Fourth Medical Examination—The subjects are (1) Medicine, (2) Surgery, (3) Midwifery, (4) Ophthalmology and Otology This examination may be taken in two parts I, Systematic, II, Clinical, Practical and Oral Candidates who have previously passed the Third Examination may present themselves for Part I of the Fourth Examination at the close of the fourth year, provided that they have fulfilled the necessary requirements as to attendance, &c., on the courses of instruction in the subjects of examination Candidates who have passed Part I of this examination may present themselves for Part II at the close of the fifth year, provided that they have fulfilled the necessary requirements as to hospital attendance on the various clinical courses in the subjects of examination Parts I. and II may be taken together at the close of the fifth year Attendance on a course in any subject of the Fourth Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the Second Medical Examination

Degrees of M.D., M.Ch., and M.A.O.—These degrees are not conferred until the expiration of at least three academic years, or in the case of graduates of the University in Arts or Science of at least two academic years, after admission to the primary degrees in the Faculty of Medicine. Every candidate must show that in the interval he has pursued such courses of study, or been engaged in such practical work as may be prescribed These degrees may be conferred by the Senate either (a) after an examination which includes written, oral clinical, and practical examinations, or (b) on the submission of a thesis or other evidence of original study or research to be approved by the Faculty of Medicine after an oral or other examination of the candidate on the subject thereof

The Medical School—The Donald Currie Chemical Buildings contain a lecture theatre, a preparation room, a chemical museum, a large class room for elementary practical chemistry, laboratories for qualitative and quantitative analysis, rooms for water and gas analysis, dark room for photographic purposes and balance room, provided with all modern appliances The Anatomical Department contains a large and well lighted dissecting room, a lecture room, a professor's and demonstrator's room, a bone room, and a laboratory for microscopic and photographic work The Medical Museum is in the same building The Jaffé Laboratories for Physiology comprise a lecture theatre, laboratories for practical work in chemical physiology, histology, and experimental physiology, and in addition small private research rooms, including balance, galvanometer, and centrifuge rooms The Musgrave Pathological Laboratory—In this department opportunity is afforded for research in pathology and bacteriology The department is in touch with most of the hospitals in Belfast, and there is an ample supply of material for investigation by graduates in morbid histology, clinical pathology, and the bacteriology of infectious diseases A course in pathology or bacteriology is given to graduates and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in the department for the Public Health Committee of the corporation in connexion with water supply, sewage disposal meat and milk supply, the diagnosis of cases of infectious diseases, &c. The certificate issued to members of the class in bacteriology qualifies for the D.P.H. degree The Pharmaceutical Laboratory is fitted and equipped for the work of practically instructing students in the compounding and dispensing of medicines

The Teaching Staff of the Faculty of Medicine—Professors—Physics W Blair Morton, M.A. Chemistry E A. Letts, Ph.D. D.Sc. Zoology Gregg Wilson, M.A., D.Sc. Botany R H Yapp M.A. Anatomy J Symington, M.D. F.R.S. Physiology (Dunville Professor) T H Milroy M.D., B.Sc. IRISH MEDICAL CORPORATIONS GRANTING DIPLOMAS

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

The College issues its Licences in Medicine and in Midwifery to practitioners whose names appear on the Medical Register of the United Kingdom

The Licence in Medicine—The subjects of examination are Practice of Medicine, Clinical Medicine, Pathology, Medical Jurisprudence, Midwifery, Hygiene, and Therapeutics.

The Licence in Midwifery—Candidates must produce certificates of registration A registered medical practitioner of five years' standing may be exempted from the examination by printed questions

The Membership—Examinations for Membership are held in February, June, and November The fee for the examination is £21 to Licentiates of the College, or £36 15s to non Licentiates Further particulars can be obtained from the Registrar of the Royal College of Physicians of Ireland, Kildare street, Dublin

The Fellowship—Fellows are elected by ballot Applicants must have been a Member of the College for at least one year and must have attained the age of 27 years There is a fee of £35 in addition to a stamp duty of £25

ROYAL COLLEGE OF SURGEONS IN IRELAND

The Licence in Surgery—A candidate whose name is entered either on the Medical Register for the United Kingdom, the Colonial Medical Register, or the Foreign Medical Register of the year in which he presents himself for examination, and who satisfies the Council that he has passed through a course of study and Examinations equivalent to those required by the Regulations of the Conjoint Board of the Royal College of Physicians of Ireland and the Royal College of Surgeons in Ireland, preceded by the passing of an Examination in Arts recognised by the General Medical Council, may, at the discretion of the Council, be admitted to the Examination

Candidates are examined in Surgery, Clinical Surgery Operative Surgery on the subject, Surgical Appliances and Ophthalmic Surgery

Diploma in Midwifery—A diploma in Midwifery is granted after examination to persons possessing a registrable qualification

Fellowship Examinations—Candidates for the Fellowship shall make application to the President and Council to be admitted to examination. They are required to pass two examinations—Primary and Final. Candidates may present themselves for the Final Examination immediately after passing the Primary part, provided they have complied with the necessary regulations. The subjects for the Primary Examination are (a) Anatomy, including Dissections, and (b) Physiology and Histology. The subjects for the Final Examination are Surgery, including Surgical Anatomy and Pathology. For admission to the Final Examination the candidate must have passed the Primary Examination, and must be a Licentiate or Graduate in Surgery of a university or licensing body recognised by the General Medical Council, all such candidates must not be less than 25 years of age.

Further particulars as to fees and conditions of examination can be obtained from the Registrar of the College, Stephen's green, West Dublin.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND AND ROYAL COLLEGE OF SURGEONS IN IRELAND

Every candidate for the Conjoint Examinations of the Colleges shall produce evidence of having before entering on medical studies passed a Preliminary Examination in general education recognised by the Royal Colleges. Each candidate before receiving his diplomas must produce a registrar's certificate or other satisfactory evidence that he has attained the age of 21 years.

Preliminary Examination—The subjects for examination are identical with those prescribed for the Preliminary Examination by the General Council of Medical Education and Registration.

Professional Examinations—Every candidate must pass four Professional Examinations—at the end of the first, second, third, and fifth years respectively of his professional studies. No candidate shall be admitted to the Final or Qualifying Examination within three months of his rejection at the Final or Qualifying Examination by any other licensing body.

First Professional Examination—Every candidate is required, before admission to the First Professional Examination to produce evidence—(1) of having passed in the subjects of the Preliminary Examination, and (2) of having attended a course of—(a) lectures on Theoretical Chemistry, six months, (b) Practical Chemistry, three months, (c) Biology, three months and (d) Physics.

The subjects of the First Professional Examination are the following—1. (a) Chemistry, (b) Physics. 2. Biology. The fee for this examination is £15 15s.

Second Professional Examination—Candidates are not admissible to this examination till they have passed in the subjects of the First Professional Examination, and they must produce evidence of having attended (a) anatomical dissections six months, and Lectures on (b) Anatomy, six months, (c) Physiology six months, (d) Practical Physiology and Histology, three months.

The subjects of the Second Professional Examination are the following—(1) Anatomy, and (2) Physiology and Histology. The fee for this examination is £10 10s.

Third Professional Examination—Every candidate is required, before admission to the Third Professional Examination to produce evidence of having passed the Second Professional Examination and certificates of having attended courses of instruction in (a) the practice of a medico-surgical hospital for nine months, (b) Pathology—(1) Systematic, (2) Practical, three months each, (c) Materia Medica, Pharmacy, and Therapeutics, three months, (d) Forensic Medicine and Public Health, three months.

The subjects for the Third Professional Examination are the following—(1) Pathology, (2) Materia Medica, Pharmacy and Therapeutics, (3) Public Health and Forensic Medicine. The fee for this examination is £9 9s.

Final Professional Examination—Before admission to the Final Examination candidates must have passed the Third Professional Examination and produced evidence of having attended in Division I the practice of a medico-surgical hospital for two periods of nine months each (unless

such evidence has been previously produced for admission in Division II), the practice of a recognised fever hospital or the fever wards of a recognised clinical hospital three months, clinical instruction in Mental Diseases, one month (12 attendances), Lectures on Medicine six months at a recognised medical school, of having performed the duties of medical clinical clerk in a recognised hospital for three months, of having attended a course of instruction in post-mortem examinations and demonstrations during one session. In Division II of having attended the practice of a medico-surgical hospital for two periods of nine months each (unless such evidence has been previously produced for admission to Division I), clinical instruction in Ophthalmic and Aural Surgery, three months, lectures on Surgery, six months at a recognised medical school, instruction in Operative Surgery, three months at a recognised medical school, of having performed the duties of surgical dresser in a recognised hospital for three months, of having attended a course of instruction in the practical administration of general anaesthetics. In Division III of having attended a midwifery hospital or maternity and having been present at 20 labours, six months, instruction on vaccination, six attendances to be certified by a public vaccinator, lectures on midwifery (including diseases peculiar to women and to new born children), six months at a recognised medical school. Candidates are recommended to present themselves in all the subjects of the Final Examination at one time, but a candidate at or after the end of the fourth year may present himself in any one of the Divisions I, II, or III, provided he has completed his curriculum as far as concerns the division in which he presents himself. The examination in at least one of the divisions must be deferred till the end of the fifth year.

The subjects of the Final Examination are (1) Medicine, including Fevers, Mental Diseases, and Diseases of Children, (2) Surgery, Operative and Ophthalmic, and (3) Midwifery and Gynaecology, Vaccination, and Diseases of New born Children. The fee is £6 6s. Further particulars can be obtained from Alfred Miller the Secretary of the Committee of Management, Royal College of Surgeons Stephen's green, Dublin.

ROYAL COLLEGE OF SURGEONS IN IRELAND (SCHOOLS OF SURGERY)—The schools of surgery are attached by Charter to the Royal College of Surgeons and have existed as a department of the College for over a century. They are carried on within the College buildings and are specially subject to the supervision and control of the Council who are empowered to appoint and remove the professors and to regulate the methods of teaching pursued. The buildings have been reconstructed, the capacity of the dissecting room nearly trebled and special pathological, bacteriological, public health, and pharmaceutical laboratories fitted with the most approved appliances in order that students may have the advantage of the most modern methods of instruction. There are special rooms set apart for lady students. The entire building is heated by hot water pipes and lighted throughout by the electric light. Winter Session commences in October, Summer Session in April. Prospectuses and guide for medical students can be obtained post free on written application to the Registrar, Royal College of Surgeons, Stephen's green, W., Dublin. Information is given therein as to the scholarships and prizes at the College.

APOTHECARIES HALL OF IRELAND

The Licence of this Hall is granted to students who present certificates of having fully completed the course of study as laid down in the curriculum and who pass the necessary examinations. The diploma of the Apothecaries' Hall of Ireland entitles the holder to be registered as a practitioner in medicine, surgery, and midwifery, with also the privileges of the Apothecary's Licence. There are three professional examinations, the total fee for which amount to 24 guineas. Women are eligible for the diploma.

There are four examinations—primary, intermediate, Parts I and II and final. They are held three times a year in March, June, and December. The primary examination comprises biology, physics, theoretical and practical chemistry

(with an examination at the bench) Candidates holding a Pharmaceutical licence are exempt from this subject. The intermediate examination comprises anatomy of the whole body (including practical dissections), physiology, practical histology, and materia medica. The final examination comprises medicine, surgery, and midwifery.

Each candidate before receiving his diploma must produce evidence that he has attained the age of 21 years. The details of the course of education required and syllabus of the examinations will be supplied on application to the Registrar at 40, Mary street, Dublin.

HOSPITALS AFFORDING PRACTICE RECOGNISED BY THE IRISH UNIVERSITIES AND CORPORATIONS¹

ADELAIDE MEDICAL AND SURGICAL HOSPITAL, Peter street, Dublin.—Fee for nine months' hospital attendance, £12 12s., six months, £8 8s. Summer, three months, £5 5s.

The certificates of attendance are recognised by all the Universities and licensing bodies in the United Kingdom. Further particulars may be obtained from Dr H Bewley.

COOMBE LYING IN HOSPITAL AND GUINNESS DISPENSARY FOR THE TREATMENT OF DISEASES PECULIAR TO WOMEN, Dublin.—This hospital contains nearly 70 beds and consists of two divisions, one of which is devoted to lying in cases and the other to the treatment of diseases peculiar to women. The practice of this hospital is one of the largest in Ireland. Lectures are delivered, practical instruction given, and gynaecological operations are performed in the theatres daily. There is a general dispensary held daily, at which instruction is given on the Diseases of Women and Children. There is a special afternoon dispensary held by the Master and his assistants, at which practical instruction in gynaecology is given. There is no extra charge for attendance at this dispensary. There is accommodation for intern pupils who enjoy exceptional advantages of acquiring a thorough knowledge of this branch of their profession. Lady medical students can reside in the hospital. The residents' quarters are comfortable. Clinical assistants are appointed from amongst the pupils as vacancies occur. Certificates of attendance at this hospital are accepted by all licensing bodies. Fees. Extern pupils for full course of six months, £8 8s.; three months, £4 4s. Intern pupils, one month, £4 4s.; each consecutive month, £3 3s.; six months, £18 18s.; board and lodging in the hospital, 21s. per week. Lady students, intern, one month, £4 4s.; each consecutive month, £3 3s. Registration fee, in advance, 10s. 6d. Students can enter for attendance at any time, but preference is given to those entering from the first day of the month. Further particulars may be had on application to the Master or the Registrar at the hospital.

Staff—Master Dr R A MacLavery. Assistant Masters Dr D O Morris and Dr R J Hennessy. Registrar Fred A Heney. Consulting Physicians Sir John W Moore and Sir J M Redmond. Consulting Surgeons Dr F W Kidd, Dr M J Gibson, and Dr W Taylor. Pathologist Dr E J McWeeney. Pathological Analyst Sir O A Cameron.

¹ This list of the institutions recognised by the Conjoint Board of Ireland is supplemented in the regulations of the Colleges by those hospitals mentioned as recognised institutions in Scotland and England. The recognised facilities for clinical instruction in Belfast, Cork and Galway have been described in connexion with the Belfast and National Universities.

SIR PATRICK DUN'S HOSPITAL, Grand Canal street, Dublin.—Classes both in Medicine and Surgery are held each morning from 9 o'clock from Oct 1st till the end of June. Special classes for junior students will be held in the wards during the months of October, November, and December. The surgical operating theatre is thoroughly in accord with modern surgical requirements. Instruction in the Diseases of Women is given on Tuesdays and Fridays at 10 A.M. There is a special wing devoted to fever cases. Pathological and Bacteriological Demonstrations will be given on Fridays at 10.30 A.M., when there is suitable material. A department for the special treatment of Throat, Nose, and Ear Diseases is under the direction of Sir Robert H Woods. Instruction will be given in these subjects and in the use of the Laryngoscope and Otolaryngoscope to senior students on Mondays and Thursdays. Practical instruction is given in anaesthetics to senior students. Practical demonstrations are given in Dentistry on Wednesdays and Saturdays. Opportunities are given the members of the hospital class of seeing the various applications of the X rays to the diagnosis and treatment of injury and disease. Opportunities are also afforded in the out-patient department for the diagnosis and treatment of the numerous minor ailments not met with in the hospital wards. A Resident Surgeon, with salary, is appointed annually. Six Resident Pupils are appointed each half-year. Six Surgical Dressers and six Clinical Clerks are appointed each month.

Prizes and Medals—Clinical medals and prizes amounting to about £15 each will be awarded in Medicine and in Surgery respectively in accordance with the will of the late Rev Samuel Haughton, M.D., S.F.T.O.D. Candidates who fail to obtain these medals and prizes will be awarded special certificates in Medicine and in Surgery provided they show sufficient merit.

Fees—Winter and summer session, £12 12s.; winter session (six months), £8 8s.; and summer session (three months), £5 5s. Special certificate in anaesthetics £1 1s. The practice of this hospital is open to students of the School of Physic, T.O.D., and the certificates are recognised by the National University and Royal College of Surgeons of England, Ireland, and Scotland.

This hospital, the largest in Ireland containing 345 beds, is open at all hours for the reception of accidents and urgent cases. Clinical instruction will be given by the Physicians and Surgeons at 9 A.M. daily. A course of Clinical Instruction on Fever

will be given during the winter and summer sessions. A certificate of attendance upon this course to meet the requirements of the licensing bodies may be obtained. Ophthalmic Surgery will be taught in the Special Wards and in the Dispensary. Surgical Operations will be performed daily. Connected with the hospital are extensive Dispensaries, which afford valuable opportunities for the study of general Medical and Surgical Diseases, and Accidents. Instruction will be given on Pathology and Bacteriology. Three House Physicians, eight House Surgeons, and 20 resident pupils will be elected annually. Dressers and Clinical Clerks will also be appointed, and certificates will be given to those who perform their duties to the satisfaction of the staff. Leonard Prizes will be offered for competition annually. For further particulars see prospectus. Certificates of attendance upon this hospital are recognised by all the Universities and Licensing bodies in the United Kingdom. A Private Hospital has been opened for the reception of Medical and Surgical cases. A Training School and a Home for Trained Nurses have been opened in connexion with the Hospital.

Terms of attendance.—Nine months £12 12s, six winter months, £8 8s, three summer months £5 5s. Entries can be made with any of the physicians or surgeons, or with the Registrar, Dr. Maria Dempsey 35 Merrion-square. A prospectus containing in detail the arrangements for Clinical Instruction, Prizes &c., may be obtained from the Secretary, Medical Board.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.—Physicians: Sir John William Moore, Dr. Edward E. Lennon, and Dr. William Borwell. Surgeons: Sir L. H. O'Grady, Mr. William Taylor, Mr. R. Lane Joynt, Dr. Oliver St. J. Gogarty and Mr. Henry Stokes. Gynaecologist: Dr. F. W. Kidd. Clinical Assistant: Dr. Mather Thomson. Pathologist: Dr. Brontë. House Surgeons: Dr. Beatrice Adderley, M.B. B.Ch. B.A.O. Univ. Dub., and Mr. Briscoe. This hospital was founded in 1753 and now contains 166 beds available for clinical teaching. A building containing 40 beds for the isolated treatment of fevers is attached to the hospital. The certificates of this hospital are recognised by all the universities and licensing bodies of the United Kingdom. Six Medical Clinical Clerks and 12 Surgical Resident Pupils and Dressers are appointed every six months, and House Surgeons and Clinical Assistants are elected annually. A prospectus giving the complete arrangements for the coming session may be obtained from the Secretary of the Medical Board, Mr. Henry Stokes, 32, Upper Pembroke-street, Dublin.

MERCERS HOSPITAL.—This hospital founded in 1734 is situated in the centre of Dublin, in the immediate vicinity of the Schools of Surgery of the Royal College of Surgeons (the Catholic University School of Medicine) and within five minutes' walk of Trinity College. It contains 120 beds for medical and surgical cases and arrangements have been made with the medical officers of Cork-street Fever Hospital whereby all students of this hospital are entitled to attend the clinical instruction of that institution and become eligible for the posts of Resident Pupils &c. There is a large dispensary for out-patients. Students of the hospital are permitted to attend the gynaecological department, where they receive practical instruction. There are special wards for the treatment and study of children's diseases. During the past few years the hospital has undergone extensive alterations in order to bring it up to modern requirements.

Appointments.—A House Surgeon is appointed annually. There are five Resident Pupils and Clinical Clerks and Dressers are appointed monthly from amongst the most deserving members of the class.

Fees.—Winter six months £8 8s, Summer three months £5 5s, nine months £12 12s.

Hayes, Dr. T. P. C. Kirkpatrick and Dr. W. A. Winter. Assistant Physician: Dr. J. J. Parser. Surgeons: Mr. R. B. McCausland, Mr. R. L. Swan, Mr. W. S. Haughton and Mr. W. C. Stevenson. Assistant Surgeon: Dr. W. A. Cooke. Anaesthetist: Dr. W. H. Lowe. Obstetric Physician and Gynaecologist: Dr. E. H. Tweedy. Ophthalmic and Aural Surgeon: Dr. R. H. Mathews. Pathologist: Dr. W. M. Crofton. Dental Surgeon: Mr. G. M. P. Murray. Resident Surgeon: Dr. G. A. Small. X-rayist: Mr. W. D. Douglas. Assistant X-rayist: Mr. G. E. Pepper. Scientific Adviser: Mr. John Joly, D.Sc., F.R.S. Assistant Dental Surgeon: Mr. H. Hayes. Secretary: Mr. R. J. Ogden. Patients, 1422.

ST VINCENT'S HOSPITAL AND DISPENSARY, Dublin.—Established 1834. 160 beds. Physicians and Lecturers on Medicine: Dr. M. F. Cox, Dr. W. J. Dargan, and Dr. Meenan. Physician for Extern Department: Dr. Magennis. Surgeons and Lecturers on Surgery: Mr. J. S. McArdle, Mr. R. F. Tobin and Mr. D. J. Kennedy. Surgeon to Extern Department: Mr. H. Meade. Gynaecologist and Lecturer on Gynaecology: Mr. A. J. Smith. Pathologist and Lecturer on Pathology: Dr. T. T. O'Farrell. Surgeon-Dentist and Lecturer on Dentistry: Mr. J. J. Murphy. Pharmacist and Lecturer on Pharmacy: R. Shaw.

THE COLONIAL MEDICAL SERVICE

IN the self governing dominions Canada, Australia, New Zealand, the Union of South Africa, and Newfoundland, medical appointments are made concerning which information can be obtained from the High Commissioners or Agents General in London, appointments in Egypt and the Sudan are regulated from the Foreign Office, in Aden and adjacent territories the appointments are under the control of the Government of Bombay, in Rhodesia the appointments are made by the British South Africa Company, London Wall Buildings, E.C., in North Borneo application should be made to the British North Borneo Company, 37, Threadneedle street, E.C., for appointments, and those in Sarawak are in the hands of H. H. the Rajah.

But in addition to all these there are a large number of important posts under the patronage of the Secretary of State for the Colonies. These concern East Africa (the East Africa, Uganda, Nyasaland, Somaliland and Zanzibar Protectorates), Eastern (Ceylon, the Straits Settlements, and Federated Malay States, Hong Kong, Weihaiwei, Mauritius, and Seychelles), West India (British Guiana, Jamaica, Trinidad, the Windward Islands, the Leeward Islands, Barbados, British Honduras, and the Bahamas), Fiji and the Western Pacific, Cyprus, Malta, Gibraltar, St. Helena, Bermuda, and the Falkland Islands, and West Africa (Nigeria, the Gold Coast, Sierra Leone, and the Gambia). As a general rule, each Colony or Protectorate has its own public service distinct from that of every other, and it is usually only the higher officers who are transferred by the Secretary of State from one Colony to another, but there are two exceptions to this rule. The West African Medical Staff, which serves Nigeria, the Gold Coast, Sierra Leone, and the Gambia form one service, and in practice the medical services of the Straits Settlements and the Federated Malay States may be regarded as one, as the officers may be and frequently are transferred from the Colony to the States, or vice versa. In Ceylon, Mauritius, Jamaica, Barbados, the Bahamas, and Bermuda vacancies are almost always filled locally by the appointment of qualified native candidates, or—in the case of some of the higher posts—by transfer from other Colonies. Appointments in Malta are all filled locally. Vacancies in the Hong Kong Medical Department are generally filled by transfer from other Colonies. In most cases the duties of a colonial medical officer are of a very general character, including medical, surgical and often public health work. It is only occasionally that a specialist is required. All applicants must be between the ages of 23 and 35 but in the case of East Africa, Uganda, Nyasaland, Somaliland, and Zanzibar preference will be given to candidates who are over 25 years of age, while in the case of Fiji and the Western Pacific preference will be given to candidates who are under 30. Candidates must be doubly qualified, and the choice will usually fall, other things being equal, on those who have held hospital appointments.

East African Protectorates.—Medical Officers in the East Africa, Uganda, Nyasaland, Somaliland and Zanzibar Protectorates are appointed on probation in the first instance for three years at the end of which period their appointments are made permanent if their services have been satisfactory but special arrangements are now in force in Uganda. The salary of a Medical Officer during probation is £400 per annum fixed but as soon as he has been confirmed in the permanent appointment his salary rises by annual increments of £20 to £500 per annum. There are 17 appointments of this nature in the East Africa Protectorate: 18 in Uganda, 11 in Nyasaland, 5 in Zanzibar and 3 in Somaliland. In the East Africa Protectorate there are certain special appointments—viz., Deputy Principal Medical Officer (£500-£570 and £50 duty allowance), Bacteriologist (£300-£370), Assistant Pathologist and Assistant Bacteriologist (£400), Two Senior Medical Officers (£500-£570 with £50 duty allowance), Analyst (£400-£450), Chief Sanitation Officer (£300-£370 and £30 duty allowance) and Three Medical Officers of Health (one at £500-£570 with £50 duty allowance, and two at £400-£500 with £40 duty allowance). In Uganda there is a Deputy Principal Medical Officer (£500-£570 and £50 duty allowance), a Bacteriologist (£500 and £50 duty allowance), a Sanitary Officer (£500-£570 and £50 duty allowance), and Two Senior Medical Officers with the same emoluments. The salary attached to the appointment of Principal Medical Officer in the East Africa Protectorate and in Uganda is £750 per annum rising to £850 per annum by annual increments of £25 and £600 per annum rising to £700 per annum by annual increments of £25 in the case of Nyasaland. Medical Officers are permitted to take private practice on the understanding that they give precedence to their official duties. There are also at present in Uganda certain temporary Medical Officers whose appointments (at a salary of £400 a year) have been created in order to cope with the work in connexion with special measures to control sleeping sickness, venereal disease, and plague. A candidate for the Uganda service will in general be offered one of these temporary appointments in the first instance and will be considered for absorption, if he wishes, when an

opportunity occurs provided that his service is approved. Temporary Medical Officers are engaged for three years and free passages provided. If a temporary Medical Officer is subsequently appointed the permanent staff of the Protectorate in which he has been employed on a temporary footing his temporary service will ultimately be reckoned for pension.

Straits Settlements.—Medical Officers are appointed as Surgeons or Assistant Health Officers at a salary of £330. After year's satisfactory service House Surgeons are appointed Medical Officers with salary rising from £400 to £600. Above this class there are nine senior appointments carrying salaries ranging from £750 (rising to £770) to £900 (rising to £920). The Principal Civil Medical Officer receives £1050 rising to £1200. Duty allowances are added to all appointments and free quarters, or an additional allowance in lieu thereof are given to House Surgeons. The authorized establishment is at present 32 officers.

Federated Malay States.—Appointments are graded as follows: Principal Medical Officer £1050 to £1200, Senior Medical Officer £750 rising to £900, Senior Medical Officer Selangor £750 rising to £1000, seven Medical Officers, Grade I £600 by £20 rising to £720, 18 Medical Officers Grade II £350 and after one year's satisfactory service £400 rising to £600, with free furnished quarters without private practice. A Medical Officer is attached to the Government of Malay States Guides his salary being £350 to £420. Senior Medical Officers in Perak and Selangor and the two Grade Medical Officers in charge of Negri Sembilan and Pahang are also consulting practice only. Other Medical Officers are prohibited in private practice except in very special cases where the Chief Secretariat is satisfied that, owing to the absence of private practitioners, it is absolutely necessary to allow the Government Medical Officer to attend to private patients. The posts of Medical Officer Grade II, in the Federated Malay States and the corresponding appointments in the Straits Settlements are filled by the promotion of officers who have entered the service as House Surgeons. A non-pensionable allowance varying with the appointment, is attached to all medical posts in the Straits Settlements and Federated Malay States. In the case of House Surgeons the allowance is at the rate of £40 a year.

Seychelles.—There are four medical appointments. The Government Medical Officer receives Rs 4500. The Assistant Government Medical Officers receive Rs 3000. The holders of these latter appointments have free quarters. Private practice is allowed.

Weihaiwei.—There are two non-pensionable Medical Officers on £3 rising to £400 with free quarters.

British Guiana.—There are 33 appointments. Candidates must be held for at least six months a resident medical appointment in a public institution. Officers are appointed on two years probation as assistant medical officers and are paid a salary at the rate of £320 per annum with quarters without the right to private practice. The permanent staff to which officers may be appointed at the expiry of the probationary period includes the following appointments: Surgeon General £900, with travelling expenses and consulting practice. Health Officer—Georgetown £300, two Medical Officers at £250 to £700, 12 Medical Officers at £500 to £500, 15 Medical Officers at £400 to £500 and five Medical Officers at £300 to £400. Two of the Officers on the completion of two years' service in the fixed £300 class automatically rise to the £350-£400 class. Medical officers appointed to districts receive travelling allowances varying with the nature of the district. They are also allowed private practice. Medical Officers attached to public institutions are in general allowed free quarters. A deduction of 4 per cent. is made from their salaries for the payment of the premiums on an insurance of the officers' life for the benefit of the widow or orphans.

Trinidad and Tobago.—In Trinidad and Tobago there are over 40 appointments. Officers are appointed in the first instance on two years probation as supernumeraries and are eligible for appointment as Government Medical Officers at the end of this period. Applicants must be unmarried and must remain unmarried whilst supernumerary Medical Officers. Supernumeraries receive a salary of £220 per annum with free furnished quarters, and are usually attached to the Government hospital. Government Medical Officers receive salary at the rate of £250 per annum with quarters and a deduction of £50 deduction from the date of first appointment as supernumerary Medical Officers. Most are employed as District Medical Officers with private practice, a residence or a rent allowance of £50 a horse allowance and in some cases other allowances for institution work. All officers are required to contribute 4 per cent. of their salaries towards the pensions of the widows and orphans of public officers.

Windward Islands (Grenada, St. Lucia, St. Vincent).—The 25 appointments are, with few exceptions, district appointments with the right to private practice attached. The salaries paid by Government vary from £250 to £350 with allowances in certain cases. The Governor has the power to transfer a medical officer from one island to another at his discretion. The appointments are pensionable.

Leeward Islands (Antigua, St. Christopher and Nevis, Dominica, Montserrat, Virgin Islands).—The 24 appointments are of the same nature as in the Windward Islands, but are not pensionable. An officer when first sent out is not appointed to a particular island but to the service of the Leeward Islands with a salary of £250 and the Governor decides as to the district which is to be allotted to him. In certain districts he may be required to perform magisterial duties. For medical officers receive fees for successful vaccinations, post-mortem examinations, attendance and giving evidence at courts of justice, certificates of lunacy and, in the larger islands, for burial certificates. They are also as a rule allowed private practice.

British Honduras.—There are seven medical appointments (besides the principal post of Colonial Surgeon) each carrying a salary of £170 per annum. Unless they already possess a Diploma of Public Health medical officers are liable to be required before they join the colony to undergo a course of instruction at a laboratory of public health or analogous institution. The dollar is about 4s 2d.

Fiji and the Western Pacific.—In Fiji the Government Medical Officers receive a salary of £350 rising by annual increments of £25 to £500 with partly furnished quarters or a horse allowance of £50. In some districts a medical officer is also a magistrate with a combined salary of £500 rising to £600 with free quarters. They are allowed

1 In the Straits Settlements and Federated Malay States all permanent Government servants are required to contribute 4 per cent. of their salaries towards the provision of pensions for the widows and orphans of public officers.

private practice so far as is consistent with the proper discharge of their duty to the Government, but in most districts the private practice is very small. They are required either to take charge of hospitals or of districts at the discretion of the authorities. The posts are pensionable. There are at present 15 Medical Officers in addition to a Chief Medical Officer (£700 a year rising to £800). The medical services of Fiji and the Western Pacific are interchangeable. While serving in the Western Pacific Protectorates their duties may be of a quasi-magisterial nature and they draw an extra non-pensionable allowance of £50 per annum.

Cyprus—There is a Chief Medical Officer paid at the rate of £500 per annum and three District Medical Officers paid at the rate of £275 per annum all enjoying private practice (except the Chief Medical Officer who is allowed consulting practice only) and receiving 2s per diem forage allowance. These are the only medical appointments in the island which are open to English candidates.

Gibraltar—There is a surgeon of the Colonial Hospital receiving £400 with fuel and light allowance and private practice. He also receives £50 for medical examination of school children. There are also two Assistant Surgeons with a salary of £350 per annum who are allowed private consulting practice only. Free quarters unfurnished are provided for all three officers.

St. Helena—The Colonial Surgeon at present receives £270 per annum and £27 horse allowance. Private practice is allowed.

Falkland Islands—There are two appointments. The Colonial Surgeon is paid at the rate of £350 per annum with £25 as Health Officer. The Assistant Colonial Surgeon is paid at the rate of £450 per annum without quarters. Part of the salary is provided from private sources. Private practice is allowed to the Colonial Surgeon and to a lesser extent to the Assistant Colonial Surgeon.

Leaves and Passages—In the East African Protectorates leave of absence on full salary is granted in the normal case after a tour of residential service (of not less than 20 nor more than 30 months) to an amount of five days for each completed month of residence (or 24 days when for any reason the officer is not returning to East Africa) exclusive of the periods of the voyages to and from. Officers serving in Uganda, Zanzibar, or in certain stations in the East Africa and Nyasaland Protectorates are allowed six or three days leave respectively in respect of each month of service. In Somaliland special leave regulations exist which provide for an officer taking leave approximately every year. Free first-class passages are provided for the officer only. In the Malay Peninsula two months leave of absence with full salary may be granted in respect of each year's service and this leave may be accumulated up to a maximum of eight months. Additional leave on half pay may be granted on special grounds. If an officer on the occasion of his first leave is in receipt of a pensionable salary of less than £500 a year he is granted a free return passage to the United Kingdom. In Hong Kong leave of absence on half salary may be granted after 4½ years service and a portion of such leave may be commuted if the Governor agrees for half the amount on full pay. Leave of absence in excess of 10 months at a time will not be granted but an extension may be allowed for ill health or very urgent private affairs.

Subject to the necessities of the service leave of absence on half salary may be granted to officers in other Colonies outside tropical Africa after a period of six years' resident service without any special grounds. Officers of the Fiji and Western Pacific service proposing to spend their leave in Europe may receive a grant in aid of passage expenses of £60. Leave may be given before the expiration of the due period in case of serious indisposition or of urgent private affairs. In the absence of special grounds the leave must not exceed one-sixth of the officer's resident service on special grounds it may exceed that period by six months. In addition to the above vacation leave on full pay may be granted if no inconvenience or expense is caused thereby not exceeding three months in any two years. In the case of Fiji and the Western Pacific and the Falkland Islands ½ months leave may be granted in any three years.

On first appointment an officer whose salary and fees together do not exceed £500 a year will except in the case of a few Colonies possessing Representative Assemblies be provided by the Crown Agents for the Colonies with free passages to the Colony for himself and his wife and children if any not exceeding four persons besides himself. The officer so appointed will be required to execute an agreement binding him to repay the cost of the passage or passages so obtained in the event of his leaving the Government service within three years. This rule applies also to officers appointed to the Malay Peninsula and Hong Kong. An officer taking leave out of the Colony has to provide his own passages.

Pensions—Officers on the pensionable establishment in the East African Protectorates are at liberty to retire on attaining the age of 50 years. Earlier retirement in the event of ill health is also provided for. Pensions are computed on the scale of one-sixtieth of the average annual salary of the retiring officer's fixed appointments for three years prior to retirement, but for purposes of calculating pensions two years' service is reckoned as service for three years. In most of the other Colonies an officer holding a pensionable appointment may be allowed in the case of ill health to retire on a pension after ten full years' resident service; otherwise he must have attained the age of 55. For ten full years' resident service fifteen sixtieths of the average annual salary of the retiring officer's fixed appointments for three years prior to retirement may be awarded to which one-sixtieth may be added for each additional year's service, but no addition will be made in respect of any service beyond 55 years. For pension purposes absence on vacation leave counts as full service and leave on half pay as half service. In a few cases the retiring age is 60 and the pension after ten years' service is ten sixtieths instead of fifteen.

West African Medical Staff

The medical services of the West African Colonies and Protectorates—namely the Gambia, Sierra Leone, the Gold Coast (including Ashanti and the Northern Territories) and Nigeria—form one service under the above name. All the medical officers for the service are selected by the Secretary of State for the Colonies and are on one list for employment and promotion. As in other Colonies applicants must be between 21 and 30 years of age and possess a sound qualification but preference is given to those over 25 and the unmarried. The higher grades are usually filled by promotion from the lower.

The grades and emoluments of officers of the staff are as follows:—
Director of the Medical and Sanitary Service. This post exists in Nigeria only. The salary attached to it is £1400 a year with a duty allowance at the rate of £250 a year.

A duty allowance is payable to the holder of the appointment to

which it is attached on y while he is actually performing its duties and during his absence or incapacity it is paid at the discretion of the Governor to the officer performing them for the time being. A duty allowance is not a pensionable emolument.

Principal Medical Officer—The Principal Medical Officers receive salary as follows: In Nigeria (Southern Provinces) £1200 a year, with a duty allowance at the rate of £240 a year. In Nigeria (Northern Provinces) £1100 a year with a duty allowance at the rate of £220 a year. In the Gold Coast £1200 a year, with a duty allowance at the rate of £240 a year. In Sierra Leone £1000 a year with a duty allowance at the rate of £250 a year. There is no Principal Medical Officer in the Gambia.

Deputy Principal Medical Officer: There are four appointments of this grade three in Nigeria and one in the Gold Coast. Salary at the rate of £800 a year rising by annual increments of £25 to £1000 a year is attached to these appointments together with a duty allowance at the rate of £120 a year.

Senior Sanitary Officer: There are four appointments of this grade, two in Nigeria, one in the Gold Coast and one in Sierra Leone. Salary at the rate of £600 a year rising by annual increments of £25 to £1000 a year is attached to these appointments together with a duty allowance at the rate of £180 a year.

Provincial Medical Officer: There are seven appointments bearing this title (four in Nigeria, two in the Gold Coast and one in Sierra Leone) with salary at the rate of £800 a year rising by annual increments of £25 to £900 a year and duty allowance at the rate of £160 a year.

Senior Medical Officer: There are 20 appointments of this grade, with salary at the rate of £600 a year, rising by annual increments of £25 to £750 a year and a duty allowance at the rate of £120 a year.

The Senior Medical Officer of the Gambia, who is the head of the Medical Department of that Colony draws staff pay at the rate of £120 a year in addition to duty pay.

Junior Sanitary Officer: There are seven appointments of this grade, with salary at the rate of £700 a year rising by annual increments of £25 to £800 a year and a duty allowance at the rate of £140 a year.

Medical Officer: The salary attached to this grade is at the rate of £400 a year rising by annual increments of £20 to £500 a year with duty allowance at the rate of £80 a year. Medical Officers who have served for five years and are recommended for a higher rate of salary are required to take a special course of study for three months. If they obtain satisfactory certificates at the end of the course they are placed on competing six years' service on a scale of salary at the rate of £525 a year rising by annual increments of £25 to £600 a year with duty allowance at the rate of £100 a year. A Medical Officer who has served for three years on the maximum salary of this scale (£500) without obtaining promotion is eligible for the grant of further annual increments of £25 up to a total maximum salary of £750 a year. Salary at the rate of £500 rising by annual increments of £25 to £600 a year is attached to about ten posts (those of Pathologist at Accra, Assistant at the Medical Research Institute near Lagos, and Medical Officer of Health at various places) irrespective of the seniority of the officer holding the appointment. In addition to the duty pay (£100 a year) staff pay at the rate of £100 a year is also attached to these posts and the holder of the appointment draws half of the staff pay during leave of absence, the remainder being drawn by his locum tenens. Certain other allowances are also drawn by members of the Staff: (a) When the Principal Medical Officer certifies that it is necessary for a medical officer to keep some means of conveyance to enable him efficiently to perform his official duties he may be granted an allowance. (b) The Government carries free of cost a reasonable amount of stores. (c) Government officers in Sierra Leone, the Gold Coast and Nigeria receive when travelling on duty away from their stations, free transport and travelling (or bush) allowance. In the Gambia the travelling allowance is fixed at a rate which includes the cost of transport. (d) All medical officers whatever their rank while employed with a military expedition will be paid an allowance of 10s a day; and they will also be given free rations or an allowance of 3s a day in lieu of rations, whenever other officers employed with the expedition are given free rations or an allowance in lieu of rations. While in receipt of these allowances medical officers will not be entitled to any repayment or allowance under (c). (e) An allowance of £12 is paid to every medical officer before his departure on first appointment towards the purchase of camp outfit. Instruments and drugs and all medical appliances (including microscopes when necessary) are supplied by the Government for all public purposes.

Leaves and Passages—The ordinary tour of residential service is one year followed by leave with full pay during the voyage to and from England and for four or two months clear in England according as the officer is returning for further service in West Africa or not. If an officer is detained beyond the year additional leave is given with full pay for ten days in respect of each completed month beyond twelve whether he is returning or not. If he is invalided before the end of the year the leave with full pay is for the voyages and for ten or five days in respect of each completed month according as he is returning or not. Leave granted on the understanding that an officer will return is known as return leave and any pay drawn in respect of such leave is liable to be refunded if he does not return. Medical officers desiring an extension of ordinary leave of absence for purposes of study may be granted such extensions with half salary. Leave may be extended with half pay for a period not exceeding four months on the ground of ill health or without pay on that or other grounds. Free passages are given to all officers who are granted leave and free passage is also given on first appointment subject to the officer signing an agreement under which he is liable to refund its cost if he relinquishes his appointment for any other reason than physical or mental infirmity or is removed for misconduct within three years from the date of his arrival in West Africa. Half pay is given during the voyage out on first appointment. The period of probation for Medical Officers is two tours of service. All officers of the Staff except Principal Medical Officers, Deputy Principal Medical Officers, Provincial Medical Officers, Sanitary Officers and a few other officers holding special appointments are at present allowed to take private practice provided that it does not interfere with the efficient performance of their official duties but it is within the power of the Governor to withdraw or suspend the privilege in such places and for such periods as he may consider desirable. Private practice does not exist

3 That is during leave on full salary. During leave on half salary he draws only one-quarter of the staff pay; during leave without salary he draws no staff pay.

at the majority of stations and as a general rule subject to the exigencies of the service stations where there is private practice are allocated to senior members of the staff. At all the recognised stations single quarters free of rent (but not of rates and similar outgoings) are provided for medical officers or an allowance is paid in lieu of quarters.

Pensions and Gratuities.—On attaining the age of 50 years or after 18 years service (of which at least 12 must have been residential) an officer is qualified for a pension calculated at one-fortieth of the last annual salary for each year of service. If invalided after a minimum of seven years' service he is qualified for a pension calculated at the same rate. If invalided before completing seven years' service he is qualified for a gratuity not exceeding three-quarters of a month's salary for each six months of service provided that he has been confirmed in his appointment. For the purpose of calculating the amount of these pensions and gratuities leave of absence without salary is not counted. In addition to the ordinary regulations an officer of the West African Medical Staff enjoys the following special privilege. At the end of nine years (of which not less than six must have been residential) he will be permitted to retire with a gratuity of £1000 or at the end of 12 years (of which not less than eight must have been residential) with a gratuity of £1250. All claims to pensions are however forfeited on the receipt of such a gratuity. In the event of an officer dying in the service after completing the period of residence qualifying him for the smaller or the larger of these gratuities a sum equal to the gratuity in question will be paid to the credit of his estate. Officers are recommended not to take their wives out with them until they have acquired experience of the local conditions and have obtained the sanction of the Governor. Passages for wives and children are not provided. If a candidate is offered an appointment he can usually be allowed sufficient time to make preparations and to terminate the employment in which he may be engaged.

Candidates for medical appointments in West Africa are allowed to express a preference for any particular Colony or Protectorate and their wishes in this respect will be borne in mind and met as far as possible but they are liable to be posted in the first instance, or transferred afterwards if necessary to any other West African Colony or Protectorate at the discretion of the Secretary of State. Candidates who wish to be posted to the Northern Provinces of Nigeria or the Gambia should be able to ride. Officers who may be transferred to pensionable appointments under the Crown elsewhere than in West Africa do not forfeit their claim to pension in respect of their West African service on final retirement provided they have been members of the Staff for at least 12 months.

Instruction in Tropical Medicine.—Every candidate selected for appointment will unless the Secretary of State decides otherwise, be required to undergo a course of instruction for two or three months either at the London School of Tropical Medicine Royal Victoria and Albert Docks E (near Connaught Road Station) or at the Liverpool School of Tropical Medicine at University College Liverpool. The cost of the tuition fees, board and residence during such instruction, amounting to a maximum of £18 8s 10d for three months will be borne by the Government in the case of the London School at Liverpool the cost of tuition will be borne by the Government but candidates must make their own arrangements for board and lodging. An allowance of £2 a week will be paid to them monthly in arrears for this purpose. A daily allowance of 5s (but no salary) will be paid to each candidate monthly in arrears during the course and may be continued subsequently up to the date of embarkation. These payments must be refunded by the candidate if he declines to accept an appointment in any of the Colonies or Protectorates for which he may be selected. If he fails to obtain a certificate showing that he has satisfied the school authorities or if he relinquishes the West African service for any other reason than mental or physical infirmity or is removed for misconduct, within three years of the date of his arrival in West Africa. If at the end of the session there exist no vacancy in the staff to which a candidate can be appointed, he will be placed in a Reserve and granted an allowance at the rate of £200 a year until the occurrence of a vacancy. If a medical officer has for any reason not taken a course of instruction prior to appointment he must take it during his first leave of absence.

Course of study for higher scale of salary.—The approved course of study is the three months course of the West London Post-Graduate College or the London School of Clinical Medicine Greenwich, in clinical medicine clinical surgery and pathology. Officers are allowed to substitute for this course either the course of study and examination for a recognised diploma or degree in public health sanitary science, or State medicine, the course of study and examination for a further medical or surgical diploma or degree, or if the Governor, on the recommendation of the Principal Medical Officer approves—a course of study in some special branch of medical or surgical practice (e.g. ophthalmology dermatology genito-urinary diseases) or an advanced course at the London or Liverpool School of Tropical Medicine. Whichever of these courses of study is selected the necessary tuition and examination fees will be paid by the Colonial Government save in the event of an officer's deciding to enter for a further medical or surgical diploma or degree.

In conclusion it should be added that the West African Medical Staff, from which many British medical officers have been lent to serve with the allied forces receive terms and emoluments which compare favourably with other medical services of the Crown. Since the outbreak of war it has been the policy of the Secretary of State for the Colonies to refrain from calling the attention of the medical profession to recent improvements in the pay and prospects of the West African Medical Staff in order that the efforts of the naval and military authorities to obtain an adequate supply of medical officers should not be hampered in any degree. This consideration no longer applies as it has been so widely recognised by all the younger members of the medical profession that the claims of the Navy and Army are paramount.

* Except that the pension of an officer who has been promoted within three years of his retirement is calculated on the average of his salary for the last three years.

DENTAL SURGERY

ANYONE who is on the Medical Register is entitled to practise as a dentist, although he cannot register as such without the special licence, but it is of eminent advantage to take the L.D.S., otherwise few dental appointments general or special hospitals or dispensaries are available. The subjects beyond those included in the general qualification are—Dental Anatomy and Physiology (Human and Comparative), one course, a separate course in Dental Histology, including the preparation of microscopical sections, Dental Surgery, one course, a separate course of Practical Dental Surgery, a course of not less than five lectures on the Surgery of the Mouth, Dental Mechanics, one course, a course of Practical Dental Mechanics, including the manufacture and adjustment of six dentures and six crowns, Dental Metallurgy, one course, a course of Practical Dental Metallurgy, Practice of Dental Surgery at a recognised school, two years, or a certificate of having been engaged during a period of not less than two years in acquiring a knowledge of Dental Mechanics (this may be obtained by apprenticeship to a duly qualified dental practitioner or in the mechanical department of a recognised dental hospital). The Dental Schools in London are the Royal Dental Hospital of London, the National Dental Hospital, Guy Hospital Dental School, and the London Hospital Dental School. Most of the large provincial towns, where there are medical schools, have now dental hospitals.

The Registration of Dental Students is carried on at the Medical Council Office in London in the same manner as the existing registration of medical students, and subject to the same regulations as regards Preliminary Examinations. Candidates for a diploma in Dental Surgery must produce certificates of having been engaged during four years in professional studies, including two years instruction in mechanical dentistry. The two years of instruction in mechanical dentistry, or any part of them, may be taken by the dental student either before or after his registration as a student, but no portion of such mechanical instruction will be counted as one of the four years of professional study unless taken after registration.

It is necessary for anyone practising Dental Surgery in this country to be on the Register, and no foreign qualifications are admitted, except the Dental Diploma granted in Belgium after examination by the Provincial Medical Commission. Certain dental qualifications granted in Australia and New Zealand are also registrable. The Royal Colleges of the United Kingdom and seven of the Universities grant degrees or licences in Dental Surgery.

THE REGISTERING BODIES IN DENTISTRY

The Royal College of Surgeons of England grants a diploma in Dental Surgery under the following regulations which apply to all candidates who have registered as dental students after Jan 1st, 1897. Candidates are required to pass three examinations: the Preliminary Science Examination, the First Professional Examination, and the Second Professional Examination. I Preliminary Science Examination.—This is identical with Part I of the First Examination of the Examining Board in England. Candidates who commenced professional study on or after Oct 1st, 1913, must pass the Preliminary Science Examination before commencing the courses required for the Second Professional Examination. II The First Professional Examination.—The candidate must produce evidence of instruction in Dental Metallurgy and Practical Dental Mechanics. The Examination consists of Part I (Mechanical Dentistry) and Part II (Dental Metallurgy) the examination in Dental Metallurgy being by written paper. The parts may be taken together or separately. III The Second Professional Examination.—This is divided into two parts: (a) the General, (b) the Dental. The General part must be passed before the Dental portion. The instruction is obtained partly at a General Hospital and partly at a Dental Hospital.—The Second Professional Examination consists of Part I, General Anatomy and Physiology, General Surgery and Pathology, Part II, Dental Anatomy and Physiology, Dental Pathology and Surgery and Practical Dental Surgery. The written examination in Part I comprises General Anatomy and Physiology

General Pathology and Surgery and in Part II, Dental Anatomy and Physiology and Dental Pathology and Surgery and a Practical Examination. Exemption from the Preliminary Science Examination is granted to candidates who have passed an Examination in Chemistry and Physics for a degree in Medicine at a University in the United Kingdom in India or in a British colony. Exemption from Examination in Anatomy and Physiology is granted to candidates who have passed the Second Examination of the Examining Board in England or the corresponding Examination for any degree or qualification in Medicine or Surgery registrable under the Medical Act of 1886. Exemption from Examination in General Surgery and Pathology is granted to candidates who have passed the Examination in Surgery of the Examining Board in England or the corresponding Examinations of the Colleges and University above mentioned. The fee for the diploma is 20 guineas and is payable as follows:—Preliminary Science Examination 3 guineas, First Professional Examination, 2 guineas, Second Professional Examination, 5 guineas, the balance to be paid on the completion of the Examinations. Synopses of examinations and all further information can be obtained from the Secretary, Examination Hall, Queen square Bloomsbury.

Royal College of Surgeons Edinburgh—Regulations giving a list of Preliminary Examinations recognised for obtaining the Licence in Dental Surgery as well as of the subjects of the Professional Examinations may be obtained from Mr D. L. Eadie, Clerk to the Royal College of Surgeons at 50 George square Edinburgh. Candidates must produce certificates of having subsequently to the date of registration, been engaged for four years in professional studies and of three years instruction in Mechanical Dentistry from a registered dental practitioner, except in the case of previously registered medical practitioners when two years will be considered sufficient. Candidates must also have attended a course of instruction at a University or in an established school of medicine or in a provincial school specially recognised by the College as qualifying for the Diploma in Surgery. In addition they will be required to have attended in a recognised dental hospital or with teachers recognised by the College special courses of lectures and instruction in Anatomy and Physiology (Human and Comparative) Surgery Pathology Materia Medica Dental Histology and Practical Dental Mechanics and Metallurgy, two years attendance at a dental hospital or the dental department of a general hospital recognised by the College. Practical instruction in Mechanical Dentistry from a registered Dentist or in the Mechanical Department of a recognised Dental Hospital and School, for three years. Candidates who have passed the First and Second Examinations for the Triple Qualification will be exempt from the First Dental Examination and will have the advantage of being admissible either to the Final Dental Examination or to the subsequent Examination for the Triple Qualification or to both. But the First Dental Examination will not be held as equivalent to the First and Second Triple Examinations and will admit to the Final Dental Examination only. Candidates who are Licentiates of this College or who may be registered medical practitioners will be required to produce certificates of attendance on the special subjects only and will be examined in these only for the dental diploma. First Professional Examination. The candidate must have attended the required courses. The examination embraces (1) Chemistry and Physics and (2) Anatomy and Physiology. The fee is £5 5s for the complete examination and £3 3s is payable for each division. In all cases of rejected candidates the fee for re-entry is £3 3s. Second Examination. The candidate must have attended the remaining courses of the curriculum and must produce certificates showing that he is 21 years of age and must pay a fee of £10 10s for re-entry £5 5s. The examination embraces (1) Surgery and Medicine, and (2) the special subjects of Dental Anatomy and Physiology Dental Surgery and Pathology Dental Materia Medica Dental Mechanics and Dental Metallurgy with a practical as well as the written and oral examinations in the subjects of Dental and Oral Surgery Pathology and Mechanics. The candidate will be tested in the Treatment of Dental Diseases in Operative Dentistry the Administration of Anæsthetics Orthodontics and in Prosthetic and Mechanical Dentistry.

Candidates who claim exemption from the First Dental Examination on the ground of having passed the First and Second Triple Qualification Examinations or other recognised examinations will before being admitted to the Second Dental Examination, be required to pay the total fee of £15 15s payable for the dental diploma. Fees and schedules must be lodged with the Clerk not later than one week before the examination.

Royal Faculty of Physicians and Surgeons of Glasgow—The regulations as to certificates, curriculum, number, and subjects of examinations fees, &c., are in effect similar to those of the Royal College of Surgeons of Edinburgh, but embrace Dental Bacteriology. Candidates can enter for the First Examination in three divisions, the first embracing Physics and Chemistry, the second Dental Metallurgy and Dental Mechanics, and the third Anatomy and Physiology. The examination in Dental Mechanics is practical, and there is at the Final Examination an examination in Practical Dentistry conducted in a dental hospital. Copies of regulations, &c., to be obtained from Mr Walter Hurst, Registrar Faculty Hall, 242, St. Vincent-street Glasgow.

Royal College of Surgeons in Ireland—Candidates for the Licence in Dental Surgery are required to pass two professional examinations. Before the First Examination the candidate must produce evidence of having attended courses in Theoretical and Practical Chemistry including Metallurgy and Physics, at a recognised institution, of having been registered as a medical or dental student by the General Medical Council, and of having attended courses of instruction in the following subjects at a recognised school of medicine: (a) Anatomy Lectures, (b) Dissections with Demonstrations, (c) Physiology including Dental Physiology, (d) Practical Physiology and Histology, including Dental Physiology and Histology, Human and Comparative. Before the Final Dental Examination the candidate must have been engaged during a period of two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist, or under the direction of the superintendent of the Mechanical Department of a recognised Dental Hospital, and have attended at institutions recognised by the College for the purpose, the following courses of instruction: (a) Dental Surgery and Pathology Orthodontia and the Materia Medica and Therapeutics applicable to Dental Surgery. Lectures Two courses. (b) Dental Mechanics Lectures Two courses. (c) Dental Anatomy Lectures One course. (d) The practice of a Dental Hospital, or of the Dental Department of a General Hospital. Two years. He must also have attended Clinical instructions at a recognised General Hospital during the ordinary teaching sessions (nine months) and have been engaged during four years in the acquirement of professional knowledge subsequently to the date of registration as a medical or dental student. One year's *bona fide* apprenticeship with a registered dental practitioner after being registered as a medical or dental student may be counted as one of the four years of professional study. He must be 21 years of age.

In the First Dental Examination candidates will be examined in (A) Physics and Chemistry including Practical Chemistry and Metallurgy (B) Anatomy, Physiology, and Histology—General and Dental. All the subjects may be passed at the same time or they may be passed in two groups (A) and (B). The examination is partly written partly viva voce and partly practical.

In the Final Dental Examination candidates will be examined in General Pathology Medicine and Surgery, Dental Surgery and Dental Pathology with the Materia Medica and Therapeutics applicable to Dental Surgery, Dental Mechanics and Metallurgy, Orthodontia. Candidates must pass in all the subjects at one examination. The examination is partly written partly viva voce and partly practical and includes the examination of patients and the performance of dental operations. Candidates are required to provide their own instruments and gold for filling. The First Dental Examination will commence on the first Mondays in the months of February May and November. The Final Dental Examination will commence on the second Mondays in the months of February May and November. The total fee for the Diploma in Dental Surgery is 20 guineas. Candidates must pay the fees for examinations from which they are exempted, unless when such exemptions have been granted in virtue of examinations passed before the Conjoint Board in Ireland.

University of Birmingham—The teaching of Dentistry is undertaken by the University acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board. The instruction at the Dental Hospital is carried out under the direction of the University Dental Clinical Board, so that students may fully qualify themselves for the Dental Diploma (L D S) of this and other universities and licensing bodies. There is a special and well-equipped Dental Museum and Laboratory. An Entrance Exhibition, value £37 10s, is awarded annually at the commencement of the winter session. The following are the regulations for Degrees in Dentistry.—1 The degrees conferred by the University are those of Bachelor and Master of Dental Surgery (B D S and M D S). 2 All candidates for these degrees must pass the same Matriculation Examination as that required from candidates for Medical Degrees. 3 The degree of Bachelor of Dental Surgery is not conferred upon any candidate who has not obtained a Licence in Dental Surgery. The candidate is not eligible for the degree until a period of 12 months has elapsed from the passing of his examination for the Licence in Dental Surgery. Of this period at least six months must be spent in the dental department of a general hospital approved by the University. 4 A In addition to the Licence in Dental Surgery the candidate must produce evidence that he has attended the courses required by medical students of the University in the following subjects and passed the Examinations held in the same for Medical and Surgical Degrees: (a) Chemistry and Practical Chemistry, (b) Physics and Practical Physics, (c) Elementary Biology, (d) Anatomy and Practical Anatomy, and (e) Physiology and Practical Physiology. B That he has passed the class examinations in: (f) One Special Course of Lectures on Medicine, (g) One Special Course of Lectures on Surgery, and (h) Pathology and Bacteriology. C That he has attended courses and passed the class examinations in: (i) Dental Histology and Patho-Histology, (j) Comparative Dental Anatomy, and (m) Dental Surgery and Prosthetic Dentistry. D That he has received instruction in the Clinical Examination of living cases at the dental department of a general hospital for a period of not less than six months. 5 The Final Examination will deal with the subjects in Classes C and D. 6 On the expiration of 12 months from the date of passing the Examination for the Degree of Bachelor of Dental Surgery, the candidate will be eligible for that of Master of Dental Surgery. 7 For this degree candidates will be required to submit a thesis containing original work and investigations in some subject connected with Dentistry, which thesis shall be submitted to examiners to be nominated by the Dental Advisory Board.

University of Bristol—Candidates for the degree of Bachelor of Dental Surgery must be not less than 21 years of age and shall have pursued the courses prescribed by University regulations during not less than five years, of which three shall have been passed in the University, and shall have been registered as dental students by the General Medical Council. All candidates for the degree of B D S are required to satisfy the examiners in the several subjects of four examinations: the First Examination, the Second Examination, the Third Examination, and the Final Examination. The First Examination. The subjects are Chemistry, Physics and Zoology, and the curriculum extends over one year. The Second Examination. The subjects are Dental Mechanics, Dental Metallurgy, and Dental Materia Medica, and the candidate shall produce evidence of having served for two years an approved pupillage in Dental Mechanics. The Third Examination. The subjects are Anatomy, Physiology, and Histology, Dental Anatomy and Dental Histology. The Final Examination. The subjects are Medicine and Surgery, Dental Surgery (including Prosthetics), Operative Dental Surgery, and Dental Bacteriology. Degree of Master of Dental Surgery. Candidates shall be Bachelors of the University, shall present a Dissertation on some subject of Dental Surgery to be approved by the Examiners and pass an examination in Dental Surgery. Diploma in Dental Surgery. Candidates need not be undergraduates, but shall be registered dental students before being admitted to any professional examination, the curriculum extends over four years. A two years pupillage in Mechanical Dentistry is required and four examinations must be passed the subjects of which differ only from those of the B D S in that Zoology is not

required for the First Examination, and Medicine is required for the Final Examination. Candidates who already registered medical practitioners shall be further exempted from study and examination in Physics, Chemistry, Anatomy, Physiology and Histology, Medical and General Surgery.

University of Durham—Every candidate for the Licence in Dental Surgery must be registered as a dental student. There are four Examinations. The subjects are:—First (a) Chemistry, and (b) Physics. Second (a) Dental Mechanics, Theoretical and Practical, (b) Dental Metallurgy. Third (a) Anatomy, (b) Physiology and Histology, (c) Dental Anatomy and Dental Histology, and (d) Dental Materia Medica. Final (a) Surgery, (b) Dental Surgery including Prosthetics and Orthodontia, (c) Operative Dental Surgery, Practical Examination, and (d) Dental Pathology and Bacteriology. A candidate before presenting himself for examination is required to furnish certificates of instruction in the following subjects, attended at registration as a dental student at recognised Colleges or Schools:—First Examination. Chemistry and Physics. Second Examination. Dental Mechanics and Dental Metallurgy. Third Examination. Anatomy, with Dissection. Physiology, Histology, Dental Anatomy and Physiology. Dental Histology, and Dental Materia Medica. Final Examination. Dental Hospital Practice (two years). General Hospital Practice (nine months), Medicine Lectures (two terms), Surgery Lectures (two terms), Dental Surgery and Pathology (a course of not less than 20 lectures). Dental Bacteriology (three terms), Operative Dental Surgery (not less than 12 lectures), and Anæsthetics (a course not less than one month).

Before admission to the Final Examination each candidate must furnish evidence (1) of having attained the age of 21 years, (2) of having undergone a three years pupillage in Mechanical Dentistry with a registered dentist, and (3) of having been engaged in professional study for at least five years subsequent to registration as a dental student. The examinations will be held concurrently with the medical examinations, and the fees payable by candidates are as follows: First Examination, £2 10s, Second Examination, £2 10s, Third Examination, £3 10s, Final Examination, £3 10s, fee for Licence £3, total £15. For re-examination: First Examination, £1 10s, Second Examination, £2, Third Examination, £2 (in one part only, £1), Fourth Examination, £2. The practical examinations in Dentistry will be conducted at the Newcastle Dental Hospital.

University of Leeds—The degrees in Dental Surgery are Bachelor of Dental Surgery (B Ch D) and Master of Dental Surgery (M Ch D). All candidates for the degree of Bachelor of Dental Surgery shall be required to have passed the Matriculation Examination, to have pursued thereafter approved courses of study for not less than five academic years, two of such years at least having been passed in the University subsequently to the date of passing the First and Second Examinations, and to have completed such part of the First examination and to have completed such part of the Second examination, or both, as may be prescribed by the regulations of the University. No candidate will be admitted to the degree who has not attained the age of 21 years on the day of graduation. All candidates are required to have passed the following examinations: the First Examination, the Second Examination, and the Final Examination. Each examination will include practical work in the subjects offered. All candidates shall be required, before presenting themselves for examination, to furnish certificates testifying that they have attended the prescribed courses of instruction in accordance with the regulations of the University in each of the subjects which they offer and that they have fulfilled the other requirements of the ordinance and regulations in respect of such examination. Candidates for the Diploma in Dental Surgery (L D S) are required to present certificates showing that they have attained the age of 21 years, that they have attended courses of instruction approved by the University extending over not less than four years, and that they have completed a pupillage of three years, or of such years at least having been taken before the First Professional Examination. Candidates are required to satisfy the examiners in the several subjects of the following examinations: A preliminary examination in the First Arts, a preliminary examination in Science, the First Professional Examination, and the Final Examination.

The classes in the Department of Dentistry will begin in October. The instruction in the Preliminary subjects of Chemistry, Physics and Biology will be given at the University in College road. The classes in the other subjects and the systematic courses in Dental subjects will be held in the School of Medicine of the University in Thoresby Place. The clinical instruction will be given in the Dental Department of the Leeds Public Dispensary, which is affiliated with the University and recognised by the Royal College of Surgeons. Applications for the prospectus should be made to the Dean of the Faculty of Medicine.

University of Liverpool (Liverpool Dental Hospital Clinical School and School of Dental Surgery).—The University grants a Licence in Dental Surgery (L.D.S.) and degrees in Dental Surgery (B.D.S. and M.D.S.). The courses of systematic instruction are given in the University buildings five minutes' walk from the Dental Hospital. The two institutions are now closely associated, and the management of the curriculum is in the hands of the Board of Dental Studies. The Dental Hospital covering a site of 672 square yards was opened in March 1910, equipped in each department with every modern accessory and receives constant additions. The laboratory is in charge of a skilled dental mechanic under the supervision of the Director of Dental Education and Dental Staff and students are able to undertake at the hospital the whole of their training in Mechanical Dentistry. The times of the lectures at the University are arranged to meet the convenience of students thus allowing the maximum time for attendance upon Dental Hospital practice. The staff of the hospital includes 12 Dental Surgeons, three Demonstrators, six Anaesthetists, three House Surgeons and a Curator. Fees. The composition fees are as follows: Licence course (L.D.S.) Composition fee £58 10s. for the course of other licensing bodies £61 10s. payable in two equal instalments, the first on entry, the second 12 months later. Two years instruction in Mechanical Dentistry (pupilage) and two years Dental Hospital Practice (combined), £100, or in two instalments of £52 10s. each. Degree course (B.D.S.) £67 10s. for all lectures (including Chemistry, Physics and Zoology) in three instalments. Two years' dental hospital, £21, general hospital practice, £10 10s., three years mechanical instruction (pupilage), £105. Further information may be had from the Director of Dental Education Mr. W. H. Gilmoor.

University of Manchester.—In the University of Manchester the Dental Department forms an integral part of the Faculty of Medicine. This contains a series of laboratories, lecture rooms, and museums which will bear comparison with those of any other school in the kingdom and the fullest opportunities for study are offered to students preparing for any of the professional examinations. Instruction adapted to the requirements of students preparing for the B.D.S. Degree and the Dental Diplomas of the University, the Royal College of Surgeons of England and of other licensing bodies is given during the Winter and Summer Sessions both at the University and at the Dental Hospital of Manchester adjoining the University. The required general hospital practice is taken at the Manchester Royal Infirmary. Women students are admitted to the classes in the Dental Department and for them common rooms are provided. The composition fee for candidates for the University degree of Bachelor of Dental Surgery is 60 guineas payable in two equal instalments at the beginning of the first and third years of studentship. The composition fee for candidates for the University Diploma in Dentistry is 55 guineas payable in two equal instalments at the beginning of the first and third years of studentship. The composition fee for candidates for the L.D.S. of England is 60 guineas payable in two equal instalments at the beginning of the first and third years of studentship. Students who have already served their apprenticeship with a private practitioner and who propose to complete the final portion of the attendance at the University and an approved dental hospital will be required to pay the composition fee in two equal instalments at the commencement of the first and second years of studentship. The composition fee does not include the hospital fees, the examination fees, the fee for the conferment of the degree or the diploma, the registration fee, nor the fees for mechanics and chemical apparatus.

University of London.—This University grants the degrees of Bachelor of Dental Surgery and a degree

of Master of Dental Surgery. A student may not be admitted to the Degree of Bachelor of Dental Surgery unless a period of not less than four years shall have elapsed from the date of his matriculation, during which period he must have pursued an approved course of study of not less than nine terms. For the degree of Bachelor of Dental Surgery candidates must pass four examinations, the first two being the same as those for the first and second examination in Medicine. The subjects of the third examination are Dental and Practical Pathology, Dental Surgery and Dental Medicine, the subjects of the fourth being Dental Surgery and Pathology, Dental Mechanics, Operative Dentistry, Orthodontia, and Dental Materia Medica. A candidate for the degree of B.D.S. must produce evidence of apprenticeship to a registered dentist for a period of two years. A portion of or the entire period may be served before commencing study for the degree of B.D.S. but no portion so taken prior to commencement of study shall count as part of the four years of Dental Study. The degree of Master of Dental Surgery will not be granted until three years after the B.D.S. has been obtained.

TEACHING INSTITUTIONS IN DENTISTRY

LONDON

Royal Dental Hospital of London School of Dental Surgery, Leicester square.—A school of the University of London and women are now admitted as students and are eligible for all hospital appointments and school prizes.—The school provides the special dental education required by the Royal College of Surgeons for the Licence in Dental Surgery. The general part of the curriculum may be taken at any general hospital. The hospital is open from 9 A.M. to 5 P.M. there being one staff for the morning and another for the afternoon of each day. Pupils are received for the training in dental mechanics recognised by the curriculum. The demonstrators at the commencement of each session give a course of lectures on Operative Dental Surgery. The six house surgeoncies are held for six months each and are open to all qualified students. The lecturers in addition to their lectures give special demonstrations on the Microscope of Dental Anatomy and Dental Surgery. The lecturer on Dental Mechanics also gives practical demonstrations in the laboratory. There are two Entrance Scholarships in Chemistry and Physics of the value of £50 and £25 respectively. One Entrance Scholarship in Dental Mechanics and Metallurgy value £25 open to pupils of the Hospital only. One Entrance Scholarship of £25 in Dental Mechanics, open to pupils of private practitioners. The Saunders Scholarship of £20 awarded to second year students. The Storer Bennett Research Scholarship for Scientific Research in any branch of Dental Surgery value £50 is awarded triennially. The Alfred Woodhouse Scholarship of £35 and the Robert Woodhouse Prize of £10 for Practical Dental Surgery. Prizes and certificates are awarded by the lecturers for the best examinations in the subjects of their respective courses at the end of the summer and winter sessions. Consulting Physician, Sir Richard Douglas Powell, Bart. Consulting Surgeon, Sir Frederick Treves, Bart. Consulting Dental Surgeon, Mr. C. S. Tomes, F.R.S. Dental Surgeons, Mr. J. F. Colyer, Mr. W. H. Dolamore, Mr. J. G. Turner, Mr. N. G. Bennett, Mr. D. P. Gabell, Mr. P. McKay, and Mr. W. W. James. Assistant Dental Surgeons, Mr. F. Coleman, Mr. Lardon Whitehouse, Mr. F. St. J. Steadman, Mr. H. Sobie, and Mr. E. F. Ackery. Anaesthetists, Dr. Dudley Borton and Mr. H. Hilliard. Assistant Anaesthetists, Mr. F. Trewby and Mr. C. Loosely. Demonstrators, Mr. A. T. Pitts, Mr. P. M. Fickling, Mr. J. F. Gore, Mr. B. Grellier, and Mr. E. L. Fickling. Lecturers.—Dental Anatomy and Physiology (Human and Comparative), Dr. Marlett Timps. Dental Surgery and Pathology, Mr. J. G. Turner. Operative Dental Surgery, Mr. W. W. James. Dental Mechanics, Mr. D. P. Gabell. Metallurgy in its application to Dental Purposes, Mr. P. A. Ellis Richards. Dental Bacteriology, Dr. W. J. Penfold. Dental Materia Medica, Mr. F. Coleman. Chemistry, Mr. P. A. Ellis Richards. Physics, Mr. John A. Carpenter. Anaesthetics, Dr. Dudley Borton. Fee for two years' hospital

practice required by the curriculum, including lectures, £53 3s in one payment or £55 13s, in two yearly instalments. The curriculum requires two years to be passed at a General Hospital, the fee for this is about £60. Both hospitals can be attended simultaneously. For the lectures in Chemistry and Physics for the Preliminary Science Examination £10 10s. The fee for the instruction in Dental Mechanics and the two years' hospital practice required by the curriculum is £150 if paid in one instalment, or 150 guineas if paid in three equal instalments. The fee for tuition in Dental Mechanics is 50 guineas per annum, for one year's hospital practice £21. The Dean attends at the hospital every Thursday morning from 9.45 to 11 o'clock, or he can be seen at other times by appointment. The Winter Session opens on Oct 2nd.

National Dental Hospital and College University College Hospital Dental School—Corner of Great Portland and Devonshire streets, W.—Students are entered as students of University College Hospital and, as such, attend the classes of Chemistry, Physics, Anatomy, and Physiology in University College, which is a few minutes' walk from the Dental Department in Great Portland street, hitherto known as the National Dental Hospital. Dental Surgeons: Mr H R Pring, Mr A. E. Relph, Mr H Creemer Cooper, and Mr F R Smyth. Assistant Dental Surgeons: Mr Arthur E Ironside and Mr F E Sprawson. Anaesthetists: Mr C J Ogle, Dr J Maughan, Mr P H Parsons, Mr R E Delbruck, and Mr H M Pinto Leite. Lecturers—Dental Anatomy and Physiology: Dr J W Pare. Dental Mechanics: Mr S Holloway. Operative Dental Surgery: Mr A. E. Relph. Dental Materia Medica: Mr F R Smyth. Dental Histology: Mr A. T. Barritt. Dental Surgery and Pathology: Mr H J Relph. Bacteriology of the Mouth: Mr K W Goadby. Practical courses to comply with the R O S curriculum are also held. Clinical Lectures and Demonstrations are given, and each student on entering passes through a preliminary course under a demonstrator. Two Entrance Exhibitions, of the value of £40 and £20, are open for competition. Prizes are open for competition at the end of each course of lectures. Fee for the full curriculum of four years, in all subjects required by the Royal College of Surgeons, 180 guineas, or in four instalments of 62, 41, 41, 41 guineas. A composition fee for medical men has been arranged covering the Two Years' Mechanical Work, Hospital Practice and Lectures required by the curriculum of the Royal College of Surgeons amounting to 120 guineas. Hospital Practice to registered practitioners by special permission of Committee, 12 months, £15 15s. The Calendar, containing full information as to Lectures, Fees, Prizes, and Subjects for the Entrance Exhibitions, value £40 and £20 each Session, may be had on application to the Dean, who attends the Hospital on Tuesday mornings at 10.30.

Guy's Hospital—The work of the Dental Department begins daily at 9 A.M. both in the extraction rooms and in the conservation room. The Extraction Rooms. A new Dental Out-patient Department has been provided. There is ample accommodation for ordinary extractions and anaesthetic extractions together with waiting- and rehiring rooms. Patients are admitted between 8.45 and 9.30 A.M., and are seen by the dental surgeon for the day, the dental house surgeon, the assistant dental house surgeon, and the dressers. The Conservation Room is open from 9 A.M. till 5 P.M. It has recently been entirely remodelled and greatly enlarged, giving a floor space of over 6000 square feet. It affords accommodation for about 100 dental chairs with the necessary equipment of the most modern type, for the use of the Dressers, who under the supervision of the Staff, perform the various operations of Dental Surgery. The members of the staff attend every morning and afternoon to give demonstrations and otherwise assist students in their work in the Conservation Room and Mechanical Laboratory. The Probationers Laboratory is supervised by two of the staff demonstrators, and instruction is given in operative dentistry on a "mannikin" to students during their first three months of study. Pupils in Dental Mechanics are received, and a graded, systematic, and full course of instruction extending over two years, is carried out. Dental students have the opportunity of attending at this hospital the whole course of instruction required by the examining board for the L.D.S. Eng.—viz., two years' pupilage in dental mechanics,

the special lectures and practice of the Dental Department, and the general lectures and practice of Medical School. The fees for these two courses be paid separately or together, or they may be combined with the fees required to be paid for the course of medical diploma. Students who enter for a medical as a dental diploma are allowed to pursue their studies of Dentistry during any period of their medical course, convenient to themselves without further charge. Entrance Scholarships in Dental Mechanics of the value £20 each are offered for competition annually, two in September and two in April, and prizes of the aggregate value of £47 are awarded for general proficiency and skill in Practical Dentistry. A Dental Travelling Scholarship of the value of £100 is awarded every second year. Dental students are eligible for admission to the Dental College and enjoy the privileges of students in Medical School. Staff.—Consulting Dental Surgeons: Mr Newland Pedley and Mr W A Maggs. Dental Surgeon: Mr Wynne Row, Mr H L Pillin, Mr M F Hope, and Mr J B Parfitt. Assistant Dental Surgeons: Mr Lewin Payne, Mr E B Dowsett, Mr F J Pearce, Mr H C Malleon. Demonstrators of Practical Dentistry: Mr F N Doubleday, Mr G B Pritchard, Mr W Stranack, Mr L D Wright, and Mr L Price. Demonstrator of Orthodontic Dentistry: Mr F Bocquet. Demonstrators of Prosthetic Dentistry: Mr H L Messen and Mr E A Tomes. Anaesthetists: Mr O J Ogle, Mr F E Shipway, Mr H M Page, and Mr A J McNeil. Lecturers—Dental Anatomy and Physiology: Mr Hope. Dental Surgery and Pathology: Mr Wynne Row. Operative Dental Surgery: Mr Parfitt. Dental Mechanics: Mr Payne. Practical Dental Mechanics: Mr Pillin. Dental Bacteriology: Dr Eyre. Dental Microscopy: Mr Dowsett. Mr G Marshall. Metallurgy: Professor T M Lowry. Practical Dental Metallurgy: Mr Pearce. Resident Dental Officer: Mr F Bocquet. Curator of Dental Museum: Mr Dowsett. Dean: Mr L Bromley. For Lectures on the general subjects of Dental Curriculum vide Guy's Medical School.

London Hospital—This school is a part of the London Hospital and Medical College, and is fully equipped on the most modern lines and with the latest appliances. It provides complete curriculum in all subjects for the L.D.S. Diploma and is admirably adapted for the purpose of teaching. The Conservation Room is well lighted and ventilated and fitted with pump chairs of the latest pattern, the fountain spittoon at every chair has been specially designed and has attached to it a saliva ejector, hot and cold water, compressed air, gas and electric current also a swing bracket to carry the students' cabinet. Electric sterilisers are supplied in each department and motor engines where required. The School possesses in addition to the Theatres, Laboratories and Museums in the College a special Museum of Dental Anatomy and Surgery, Operative Dentistry, Prosthetic and Extraction Rooms, and Laboratories for Practical Dental Metallurgy and Dental Prosthesis. A systematic course of instruction in Dental Prosthesis is arranged for pupils. The up-to-date Laboratory contains every modern apparatus and is in charge of a skilled curator and his assistants. Connected with the Medical College and Dental School are a Library, Athenæum, Clubs' Union Dining Hall with moderate tariff, Students' Hostel, and an Athletic Ground. Lecturers—Chemistry and Dental Metallurgy: Hugh Candy. B.A. B.Sc. Physics: A H Fison. D.Sc. Human Anatomy: Professor William Wright. Physiology: Professor E P Othcart. Dental Surgery and Pathology: Sir Francis Farmer. Operative Dental Surgery: Dr George Northcroft. Dental Prosthesis: Mr Wilton Thew. Operative Dental Prosthesis: Dr G Paton Pollitt. Odontophosphoric Orthopaedics: Dr Harold Chapman. Dental Anatomy: Professor William Wright. Dental Microscopy: Mr Evelyn Sprawson. Dental Bacteriology: Professor William Bullock. F.R.S. Dental Materia Medica: Dr O Leyton and Mr F A Hocking. B.Sc. Lond. Dental Anaesthetics: Dr R J Probyn Williams. For full particulars as to fees and course of study advised apply to the Dean (Professor William Wright M.B., D.Sc., F.R.C.S.) who will be glad to make arrangements for anyone wishing to see the Dental School and Medical College.

London (Royal Free Hospital) School of Medicine for Women—Full courses are arranged for women students for the study of dentistry, and in preparation for the Licence in Dental

Surgery of the Royal College of Surgeons of England, at the London (Royal Free Hospital) School of Medicine for Women in conjunction with the London Dental Hospital, Leicester Square and the National Dental Hospital, Great Portland Street W. The course is arranged as follows: First and second years Chemistry, Physics and Dental Mechanics; Third, fourth and fifth years Anatomy, Physiology and Special Dental Courses in Medicine and Surgery, General Hospital Course, Dental Hospital Course. The combined fees at the London School of Medicine for Women and the National Dental Hospital are £180 if paid in one sum on beginning the course, or £191 if paid in three annual instalments. Bursary: The Council of the School will award annually (until further notice) an "Agnes Guthrie" Bursary of the value of £60 to a student fulfilling the required conditions who enters for the full dental course. Candidates are required to send in applications on or before July 15th to the secretary and warden, from whom a prospectus of the School and all particulars can be obtained.

PROVINCIAL.

Birmingham Dental Hospital.—The Dental Hospital was founded in 1858 and was recognised by the Royal College of Surgeons in 1880 for the teaching of Dental Students. Having an annual attendance of about 16,000 patients it affords every advantage for students about to enter the profession to acquire a thorough practical knowledge, as required by the Medical Council. The present Hospital was opened on July 6th 1905. It has accommodation for 50 students. The equipment is in accordance with the most modern requirements for the efficient teaching and practice of Dental Surgery. The operations performed annually average 35,000 including 5000 gold and other fillings and many cases of crowns, bridges, porcelain inlays, and regulations. By arrangements with the Birmingham University and with the General and Queen's Hospitals the entire course of Lectures, Hospital Practice &c. may be completed for an inclusive fee of £96 15s., or including Mechanical Pupillage £186. The instruments and materials necessary for Hospital Practice cost about £28. The Composition Fee for the courses required for the L.D.S. of the University or any of the Corporations alone, is £60, payable in two annual instalments at the commencement of the first and second years, that for the courses required for the L.D.S. and the Degree in Dentistry of the University is £75, that for the L.D.S. in combination with the M.R.C.S. and L.R.C.P. is £85, and that for the M.B. Ch.B. and B.D.S. is £95. All of these composition fees are payable in two annual instalments at the commencement of the first and second years. Each of these fees covers the cost of the courses given at the University for the qualifications indicated but does not include fees for Hospital teaching. For two years dental hospital practice the fee is 20 guineas payable in two instalments of 10 guineas each at the commencement of the first and second (hospital) years respectively. For two years mechanical pupillage 85 guineas which may be paid in two annual instalments of 50 and 35 guineas respectively, mechanical pupils may join for a probationary period of one month, fee 5 guineas which is deducted upon payment of the full amount. For general surgical hospital practice lectures and demonstrations Surgery two winters £10 10s. One Entrance Scholarship is offered annually of the value of £37 10s. It is awarded to the student who entering for the Dental Degree of the University in October or having entered not earlier than the previous April shall pass the best examination in the subjects studied during his apprenticeship. Candidates must be under the age of 21 years. Application for admission together with a certificate of birth must be sent to the Dean of the Medical Faculty on or before Oct. 15th. Staff.—Dean Mr W. Thompson. Medical Consulting Physician (Vacant). Consulting Surgeon Mr Haslam. Consulting Dental Surgeon Mr Frank E. Huxley. Honorary Dental Surgeons Mr F. W. Richards, Mr F. H. Goffe, Mr A. E. Donagan, Mr J. Mountford, Mr W. T. Madin, Mr J. L. Parrott, Mr W. M. Knott and Mr G. F. Cale Matthews. Honorary Assistant Dental Surgeons Mr A. H. Parrott, Mr C. H. Howkins, Mr S. H. Roe, Mr A. W. Wellings, Mr W. J. Lower and Mr Harold Round. Honorary Orthodontic Officer Mr G. F. Cale Matthews. Anaesthetists Dr S. W. Harnes, Dr W. J. McCardie, Mr R. H. Pollock, Mr Whitaker, Dr R. W. Taylor, Haddow, Mr

L. Kirkby Thomas, Dr Hattly Burn and Dr D. Buchan. Demonstrators Dr Humphrey F. Humphreys, Mr N. A. Austin and Dr R. A. Broderick. Stipendiary Dental Surgeon Mr C. W. Randall. House Surgeons Mr R. L. Booth and Mr L. Williams. Prosthetic Department Mr W. M. Knott and Mr S. H. Roe.

Leeds Public Dispensary.—The Dental Department of the Leeds Public Dispensary is fully equipped with every modern appliance to provide training for Dental Students, and affords every opportunity for the student to prepare for any of the Dental Degrees or Diplomas. The Demonstrator of Operative Dental Surgery instructs students during their probationary course. At the completion of this training students have patients allotted to them by the Demonstrator, and have every opportunity of acquiring knowledge from the members of the Staff, two of whom are in attendance each day. The following prizes are awarded:—First year Students value 2 guineas. Operative Dental Surgery Prize value 5 guineas. Two prizes in Prosthetic Dentistry (a) a prize, value 2 guineas for first year pupils, (b) a prize value 5 guineas, open for competition to all Students. Extraction prize, value 2 guineas open for competition to all Students. A prize in Orthodontics, value 5 guineas, is open to all students. Dental Staff.—Consulting Dental Surgeon Mr Frederick Sherburn. Dental Surgeons Mr Percival T. Leigh, Mr Walter Marston, Mr A. G. G. Plumley, Mr Stephen D. Hey, Mr David Saville and Mr J. Newcome. Taylor Assistant Dental Surgeons Mr James W. Mawer, Mr Geoffrey A. Phillips, Mr J. K. Crawford, Mr W. S. Thorburn, Mr Harold R. Bentley and Mr Sidney H. Hole. Anaesthetists Dr F. Whaller and Mr E. Wrigley. Braithwaite, Demonstrator and Tutor Mr C. H. Child. Curator of Dental Museum Dr A. G. G. Plumley. House Surgeon Mr E. A. Rogerson. Instructor of Dental Mechanics Mr C. E. Foster. Warden Mr Stephen D. Hey, to whom all communications should be addressed.

Dental Hospital of Manchester.—This Hospital is in association for teaching purposes with the University of Manchester and the Royal Infirmary, and is in the centre of a very large population. Courses of study are provided to meet the requirements of the various examining bodies, including those of the University of Manchester for the qualifications L.D.S. and B.D.S. and the L.D.S. of the Royal College of Surgeons of England. Clinical instruction is given by the members of the staff and by the house surgeons and demonstrators, and also by the honorary anaesthetists in the administration of nitrous oxide gas, a special class in anaesthetics is conducted by the clinical tutor in that subject.

A Travelling Scholarship, value £100 will be awarded from time to time. Ten prizes, varying in value from £2 to £8 are awarded annually.

For the whole course of hospital instruction for the L.D.S. (including two years mechanical training) the fee is £100 or if paid in instalments £105. For the two years Operative Course only £21 or if paid in two instalments, 21 guineas. For the whole course of hospital instruction for the B.D.S. degree (including mechanical training) £130 or if paid in instalments 130 guineas. Additional practice in Dental Mechanics may be taken by pupils who have already received their mechanical training elsewhere, at a fee of £20 for six months.

Women students are admitted to the practice of the hospital. Staff.—Consulting Physician Dr J. J. Cox. Consulting Surgeon Mr J. Howson Ray. Consulting Dental Surgeons Mr I. Renshaw, Mr Thomas Tanner, Mr W. Dykes and Mr W. Sims. Dental Surgeons Mr G. G. Campion, Mr J. W. Dunkerley, Mr J. W. Gibbons, Mr D. Headridge, Mr R. Howard, Mr P. A. Linnell, Mr J. Hilditch Mathews, Mr H. W. Norman, Dr C. H. Preston, Mr T. E. Sherratt, Mr J. Stephenson, Mr G. O. Whitaker, Mr S. S. Doran, Mr T. Dykes, Mr Felix Rawsthorne, Dr H. Summs and Mr B. J. Rodway. Anaesthetists Mr A. Wilson, Mr S. R. Wilson, Mr E. Mour and Dr W. Wilson. Prosthetic Dental Surgeons Mr J. Stephenson and Mr B. J. Rodway. Clinical Tutor in Anaesthetics Mr S. R. Wilson. Demonstrator in Operative Dental Surgery Mr H. V. Brown. Demonstrator in Orthodontics (Vacant). Demonstrator in Dental Prosthetics Mr E. V. Pollitt. Instructor in Dental Mechanics Mr H. W. Fillan. Tutor Dr C. H. Preston. Curator of Museum Dr C. H. Preston. Copies of the Prospectus will be forwarded on application to Mr J. Hilditch Mathews, Dean.

Newcastle upon Tyne Dental Hospital and School—This Hospital is centrally situated (within five minutes of the various colleges, infirmary, and railway station), the rooms are well lighted and thoroughly equipped for carrying on the work. Dental surgeons and an aesthetist attend each morning. A tutorial dental surgeon is also in attendance. The Composition Fee for the special Dental Lectures and Dental Hospital Practice is £45 3s if paid in one sum, or £46 4s if paid in two instalments of £23 2s. The Composition Fee for the Lectures at the Colleges of Medicine and Science is 40 guineas; in addition to this there is a library and an athletic fee. Particulars of the fee for General Hospital Practice may be obtained from the Senior House Physician, Royal Victoria Infirmary, Newcastle-upon-Tyne. Medals and Certificates of Merit are granted to students showing certain standards of proficiency in the various classes at the Dental School. Lecturers—Dental Anatomy and Physiology—Mr E Y Richardson. Dental Surgery and Pathology—Mr J Coltman. Operative Dental Surgery—Mr T R D Walkinshaw. Dental Histology—Mr C L Rontledge. Dental Mechanics—Mr J W Daniels. Dental Materia Medica—Mr J Bolam. Dental Metallurgy—Mr C Loting. Orthodontia—Mr A Jameson. Dental Anaesthetics—Dr W E Alderson. The prospectus of the Dental Hospital and School, containing full information, may be obtained from either Mr J T Jameson, 12, Windsor crescent, Newcastle upon Tyne, Dean, or Mr James Coltman, 13, Ellison place, Newcastle upon Tyne, Vice Dean.

University of Sheffield—Specially and beautifully fitted rooms have been provided for the Dental Lectures in the medical block. Dental students are able to take full advantage of the teaching of the various departments of the University concerned in their special teaching. A course of Practical Demonstrations in Dental Histology and Pathology has been added. Composition Fee for the Lectures, £30. The Dental School forms part of the University of Sheffield. Professors and Lecturers—Dental Metallurgy—Mr F K Knowles and Mr F Ibbotson. Dental Mechanics—Mr H James Morris. Dental Anatomy and Physiology—Mr W J Law. Dental Surgery and Pathology—Mr F G Mordaunt. Dental Histology—Mr W J Law. Dental Bacteriology—Professor J S O Douglas and Dr H G M Henry. Dental Materia Medica—Mr P S Stokes.

Sheffield Royal Hospital—The Dental Hospital forms part of the General Hospital. The department has a fully equipped Mechanical Laboratory, with an Instructor in daily attendance, where pupils receive the two years' instruction in Mechanical Dentistry required by the curriculum. Two additional Dental Anaesthetists have been appointed, and the whole department has been reorganised and fitted with electric motors, &c. Fee for Dental Hospital practice, £21. Honorary Dental Surgeons—Mr F G Mordaunt, Mr Percy S Stokes and Mr H J Stoner. Honorary Assistant Dental Surgeons—Mr R O Webster, Mr J H Skerritt, Mr W Skerritt, and Mr F W Goodwin. Further particulars with regard to the Dental, Medical, and Surgical studies may be obtained from the Calendar of the University or from the Dean of the Medical Faculty.

Devon and Exeter Dental Hospital, 24 Southernhay, West, Exeter—Established 1880—The hospital is open daily (Sundays excepted) and patients are admitted between the hours of 9 and 11 A.M. Students attending the practice of the hospital must consider themselves strictly under the control of the medical officers and must not undertake any operation without the consent of the dental surgeon for the day. Honorary treasurer—Mr J M Ackland, secretary, Mr W Alfred Hooker, A.L.A.A.

SCOTLAND

The Incorporated Edinburgh Dental Hospital and School—The Edinburgh Dental Hospital and School is located in a spacious and well equipped building at 31, Chambers-street and offers special advantages to dental students. The General Courses required for the Dental Diploma may be taken in the Medical School of the Royal Colleges of Physicians and Surgeons or in the University schools. The hospital attendance and clinical instruction are taken at the Royal Infirmary. The University Medical Schools, and Royal Infirmary are within three minutes' walk of the Dental Hospital. The special courses are taken in the hospital. The Dental Hospital practice, extending

over two years, affords a student ample opportunity to a full acquaintance with every branch of dentistry. The hospital admits a limited number of indentured pupils. They receive their instruction in Mechanical Dentist concurrently with the general and special courses. The premium of 60 guineas is payable with each indentured pupil. The practice and lectures of the hospital are recognised by, and qualify for, all the Licensing Boards. The cost of the hospital outfit of instruments, included in the Dental Hospital fee of £31 10s, is the minimum cost of classes and Diploma for the whole course of dental instruction amounts to £90 7s. Those students who desire to take a Medical and Surgical Diploma in addition to the L.D.S. have in this school admirable facilities for so doing. The triple qualification of the Royal College of Physicians and Surgeons of Edinburgh at the Royal Faculty of Physicians and Surgeons of Glasgow is recommended. The minimum cost of Professional Education, the Triple Qualification, and the Licence in Dental Surgery amounts to £169 7s. Further particulars can be obtained from the Dean, Mr W Guy.

Incorporated Glasgow Dental Hospital and School, 168, Renfrew-street, and 16, Dalhousie street, Garnethill, Glasgow—The winter session will begin in October, and the lectures will be delivered as follows. In Dental Mechanics on Tuesday and Thursday at 7 P.M., by Dr Hugh McKay, and in Dental Metallurgy on Monday and Wednesday at 7, by Mr W Bruce Hepburn, L.D.S. Fee for each of the above courses of lectures, £3 3s. Lectures will also be delivered on the following subjects: Dental Surgery by Mr J Mason Noble, Dental Anatomy and Physiology, by Dr Fred M Murray, Dental Pathology and Bacteriology, by Mr J F Webster, Anaesthetics, by Dr R Home Henderson, Operative Technique, by Mr Adam Ombie. The lectures and instruction at the Glasgow Dental Hospital and School are recognised by all the licensing bodies in the United Kingdom. The fees for two years' hospital practice are £15 15s. The hospital is opened daily from 5 to 7 P.M. (Sundays excepted). Students may only enrol during the months of April or October. Summer session begins in April. Winter session begins in October.

Glasgow Royal Infirmary (Dental Department)—Mr W. Taylor attends at the Royal Infirmary at 9 A.M. on Mondays, Wednesdays, and Fridays, and gives a course of instruction in Dental Surgery on these days. The following course in the curriculum can be taken at St. Mungo's College: Anatomy, six months; Practical Anatomy, nine months; Physiology, six months; Chemistry, six months; Practical Chemistry with Metallurgy, three months; Surgery, six months; Medicine, six months; Materia Medica, three months; Clinical Surgery, six months; Dental Surgery, six months, and attendance for two years on the dental department of the hospital. The attendance on the Dental Clinic is free to students of the hospital.

IRELAND

Incorporated Dental Hospital of Ireland—Lincoln place, Dublin—All Dental Students who have passed their First Dental Examination in the Royal College of Surgeons in Ireland (or an equivalent examination or examinations) are admissible to the Clinical Instruction of the Hospital, after paying fees and subscribing to the conditions prescribed by the staff. In addition to Clinical Instruction and Special Demonstrations courses of lectures are given at the hospital on Dental Surgery and Pathology, Mechanical Dentistry, the Administration of Anaesthetics, Orthodontia, Dental Anatomy and Dental Materia Medica. Practical instruction is also given in Anaesthetics. In addition to the longer courses of hospital attendance, courses of three months' duration will be given to surgeons intending to practise in the Colonies or remote country districts or in the Army and Navy.

Fees—Dental Hospital Practice (each year) £12 12s., Lectures £6 6s., Composition Fee, £15 15s. per annum. In addition to the above courses registered dentists who are members of the British Dental Association will usually be permitted to take out a three months' course for a fee of 6 guineas. The course in practical Dental Mechanics can be taken in the Hospital Laboratory. Further particulars can be obtained from the Dean, Mr George Sheppard, F.R.C.S.I., L.D.S. Eng.

The War.

THE CASUALTY LIST

The following names of medical officers appear among the casualties announced since our last issue —

Killed

Captain J O'Brien, R.A.M.C., attached to the Royal Field Artillery

Captain H K Birley, Manchester Regiment, was educated at Owens College, Manchester and qualified in 1895. After holding appointments at the Manchester Cancer Hospital and at the Chorley Dispensary and Rawcliffe Hospital he commenced practice at Irlams-o'-th' Height and was Assistant County Director of the British Red Cross Society at Pendleton. On the outbreak of war he was given a combatant commission in the Manchester Regiment, and went to the front in November last.

Died of Wounds

Captain G Stanton, R.A.M.C., attached to the Lancashire Fusiliers, was educated at Trinity College Dublin and qualified in 1915.

Captain G H Wood, New Zealand Medical Corps, was educated at Durham University, qualifying in 1909. After holding appointments at the Royal Victoria Infirmary, Newcastle-on-Tyne, he practised in New Zealand, and subsequently joined the New Zealand Expeditionary Force.

Captain J P Walsh, Canadian A.M.C., attached to the Canadian Infantry.

Died

Major T G Brodie, F.R.S. Canadian Army Medical Corps, was educated at King's College London and qualified in 1890. He was formerly professor superintendent of the Brown Institute University of London and at the time of his death was professor of physiology at the University of Toronto, Canada.

Captain R I Binning, Indian Medical Service qualified M.B. Ch.B. Glasg. in 1907, and subsequently held appointments at the Western Infirmary and at the Royal Infirmary Glasgow.

Major A E J Harding, R.A.M.C. qualified M.B. Ch.B. Edin. in 1900 and was formerly civil surgeon to the South African Field Force. At the time of his death he was in command of the 22nd Stationary Hospital Bombay.

Wounded

Lieutenant P R Boswell, R.A.M.C.

Lieutenant W E Dimond, R.A.M.C.

Captain M Gross, R.A.M.C.

Captain E S B Hamilton, R.A.M.C.

Lieutenant T H James, R.A.M.C.

Captain F P Kerr, D.S.O. R.A.M.C. attached to the Liverpool Regiment.

Captain R J B Madden, R.A.M.C.

Captain B C Maybury, R.A.M.C.

Captain T M Newton, R.A.M.C.

Captain A W Raymond, R.A.M.C.

Lieutenant J MacM Watson, R.A.M.C.

Captain W L R Wood, R.A.M.C. attached to the Army Service Corps.

Captain J Fraser, R.A.M.C.

Captain S B Faulkner, R.A.M.C.

Captain N G Charasse, R.A.M.C. attached to the Liverpool Regiment.

Captain E D Gairdner, R.A.M.C. attached to the Royal Scots.

Lieutenant J H C Gatchell, P.A.M.C. attached to the Royal Lancaster Regiment.

Captain H H Roblason, R.A.M.C. attached to the Liverpool Regiment.

Captain O Teichmann, R.A.M.C. attached to the Leomanby North Lancashire Regiment.

Captain F J O King, R.A.M.C. attached to the Royal Fusiliers.

Captain P Thornton, R.A.M.C. attached to the Royal Fusiliers.

Major F Worthington, D.S.O. R.A.M.C.

Captain H B Davy, P.A.M.C. attached to the Royal Welsh Fusiliers.

Captain A M Trotter, New Zealand Medical Corps.

Lieutenant W J Knight, P.A.M.C.

Previously reported killed, but returned at K. O. (Mara).

Previously reported Prisoner.

Major F Tennant, P.A.M.C.

Captain T E Osmond, P.A.M.C.

Lieutenant F O Donoghue, Indian Subordinate Medical Department.

Lieutenant W C Spackman, Indian Medical Service.

DEATHS AMONG THE SONS OF MEDICAL MEN

The following sons of medical men must be added to our lists of those who have fallen during the war —

Second Lieutenant F W Long, R.F.A., elder son of the late Dr F T Long, Greenodd, Lancs.

Lieutenant L T Seymour, York and Lancaster Regiment, second son of Dr L W Seymour, of Woodstock road, Oxford.

Second Lieutenant C B Bass, 10th Yorkshire Regiment, elder son of the late C W Bass, M.R.C.S.

THE HONOURS LIST

The King has conferred the honours mentioned upon the following medical officers in recognition of their gallantry and devotion to duty in the field —

Distinguished Service Order

Temporary Captain Edward Carwardine Gimson, R.A.M.C.

For conspicuous gallantry when continually attending to the wounded under very heavy shell fire. He has displayed the greatest devotion to duty and contempt of personal danger.

Temporary Captain Penrose Lanyon Watkins Williams, R.A.M.C.

For conspicuous gallantry when tending the wounded for six hours in a shell crater under very heavy shell fire. He was twice knocked over by the explosion of shells and his coat and putties were ripped by shrapnel.

Military Cross

Temporary Lieutenant George Perry Armstrong, R.A.M.C.

For conspicuous gallantry and devotion to duty when tending the wounded in the open under heavy fire and getting them back to our own lines.

Temporary Lieutenant Frank Russell Hassard, R.A.M.C.

For conspicuous gallantry and devotion to duty when collecting the wounded under shell, machine-gun, and sniper fire.

Temporary Captain Hubert Arnold Pallant, R.A.M.C.

For conspicuous gallantry and devotion to duty when attending to the wounded under heavy fire. Later he voluntarily acted as stretcher bearer and helped to carry off nearly 40 wounded under heavy shell and machine-gun fire.

Temporary Lieutenant Valentine Frederick Stock, R.A.M.C.

For conspicuous gallantry and devotion to duty. After being rendered unconscious by shell explosion he insisted on returning to duty and for several days carried out his duties by daylight and exposed to heavy fire.

Temporary Lieutenant Gordon Blanchard Wiswell, R.A.M.C.

For conspicuous gallantry and devotion to duty when attending to the wounded and directing stretcher bearers under shell and machine-gun fire without a sleep or rest for three days and nights.

Captain Clarence Woods Johnston, Canadian A.M.C.

For conspicuous bravery and devotion to duty. He went forward to establish a new dressing station under terrific fire and worked continuously for three days making many trips backwards and forwards with complete success in regard to the evacuation of his wounded.

Captain William Jonas McAlister, Canadian A.M.C.

For gallantry and devotion to duty in attending wounded under very heavy shell fire. Though he was up and badly shaken he continued his work which at all times has been splendid.

Captain John Bruce McGregor, Canadian A.M.C.

For gallantry and devotion to duty during a period of great stress. Under great difficulties he cleared all his casualties and on occasions carried out his duties under very heavy fire quite regardless of personal danger.

Captain Albert Ross, Canadian A.M.C.

For conspicuous courage and devotion in the performance of his duties. After all dug-outs had been blown in he continued to dress and tend to the wounded in open trenches or wherever necessity existed.

Captain Frederick James Tees, Canadian A.M.C.

For bravery and fearless devotion to duty under heavy shell and machine-gun fire. Captain Tees led his bearers in exposed situations with great gallantry and successfully evacuated all his wounded.

Captain Herbert William Wedge, Canadian A.M.C.

For conspicuous bravery and devotion to duty when in charge of an advanced dressing station. Under intense bombardment he continued to dress and evacuate wounded for four hours. Later under conditions of extreme danger and difficulty he succeeded in evacuating all his wounded.

The names of Temporary Captain H A Pallant and of Temporary Lieutenants F R Hassard, V F Stock and C B Wiswell all of the R.A.M.C. appeared in the Honours List in THE LANCET of August 5th 1916 p. 233 and are repeated above with a statement of the specific acts for which the honours have been bestowed.

The following promotions and appointments of medical men in connexion with the operations in Mesopotamia are announced —

C.M.G. — Lt Col H C Mandesley, Australian Army Medical Corps.

Military Cross — Capt J A Cruickshank, I.M.S., Capt G Wilson, R.A.M.C.

Correspondence.

"Audi alteram partem"

VOLUNTARY HOSPITALS AND THE SPIRIT DUTY

To the Editor of THE LANCET

SIR,—The House of Commons has voted £10 000 as an annual grant to be made to Voluntary Hospitals by way of affording relief in respect of duty paid on rectified spirit used for medical and surgical purposes. It is anticipated that the distribution of this sum will be based on the scheme recommended by the Treasury Committee appointed by the Chancellor of the Exchequer to deal with the matter. This grant will go a long way indeed towards meeting the burden of the very heavy duty payable on spirit used in hospitals for pharmaceutical purposes.

Many attempts have been made from time to time to obtain some relief, but invariably without success, until Mr W. Olive Bridgeman, M.P., one of the Lords of the Treasury and treasurer of the Florence Nightingale Hospital, took the matter up in March, 1915, when Unionist Whip, by bringing the matter to the notice of Mr Lloyd George. On becoming a member of the Coalition Government Mr Bridgeman secured the sympathetic action of Mr McKenna, whose proposals, however, met with opposition from unexpected quarters. The British Medical Association and the Pharmaceutical Society very strongly objected to Mr McKenna's proposals for reasons which were difficult to understand and which were founded on mistaken and incomplete knowledge of the question at issue. Mr Bridgeman, with splendid persistence and tenacity, continued his efforts and eventually secured the appointment of a committee charged with the duty of devising a scheme, this committee presented its report a few weeks ago, and the result is as stated above. It is bare justice to Mr Bridgeman to state that this excellent result is due entirely to his initiative and to his continuous efforts, in spite of great difficulties, to achieve his object. The thanks of hospital authorities are also due to THE LANCET for its powerful support of Mr Bridgeman's proposals contained in the two leading articles in its July issues of 1915.

The machinery for administering the grant will doubtless be set up by the authorities very shortly.

I am, Sir, yours faithfully,

F. A. HOCKING,

August 18th 1916

Pharmacist, London Hospital B

Medical News.

THE MESOPOTAMIA INQUIRY—The first sitting of the Commission to inquire into the operations in Mesopotamia was held on August 21st at the House of Lords, when the evidence of Sir Edmund Barrow, Military Secretary to the India Office, was taken. The Commissioners decided that the meetings of the Commission be conducted in private.

THE INDIAN MEDICAL SERVICE—It was recently announced in the press that after the open competitive examination held last July for admission to the Indian Medical Service no similar examination would be held during the continuance of the war but that such appointments as might be required to meet the absolutely indispensable needs of the service would be made by nomination by the Secretary of State. To assist him in making these appointments, which, as already announced, will be limited in number to the absolutely indispensable needs of the service, Mr Chamberlain has appointed a selection committee, who will summon and interview such applicants as may appear to be *prima facie* suitable and make recommendations for appointment. Applications for appointment should be addressed to the Secretary of the Military Department, India Office, Whitehall, S.W., and should contain concise particulars of the applicant's medical degrees and career. Applicants must be over 21 and under 32 years of age at the time of application. Particulars regarding pay, promotion &c. in the service can be obtained from the Secretary, Military Department.

METROPOLITAN ASYLUMS BOARD DIPLOMA IN PUBLIC HEALTH—A three months' course of lectures and demonstrations in hospital administration will begin at the undermentioned hospitals on the days and at the times stated below: North Western Hospital, Hampstead, N.W., Dr E. W. Goodall, Mondays and Fridays at 5 P.M., beginning Monday, Oct 2nd; Grove Hospital, Tooting Graveney, S.W., Dr J. E. Beggs, Mondays and Thursdays at 5 P.M., beginning Thursday, Oct 5th. The fee for the course is £3 3s. and is payable to Mr Duncombe Mann, clerk to the Metropolitan Asylums Board.

WE regret to learn the sudden death in London of Dr Thomas Gregor Brodie, F.R.S., professor of physiology in the University of Toronto and formerly professor-superintendent of the Brown Institute.

THE Wellcome Historical Medical Museum will be closed from Sept 1st to 30th inclusive for cleaning. It will reopen in October with a loan exhibition illustrating the folk lore of London, including medical charms, amulets, and other objects found to have been used by the superstitious in connexion with the cure and prevention of disease.

WE are informed that Dr Robert Armstrong Jones, superintendent of the London County Lunatic Asylum at Claybury, has retired from his position, which he has held with much distinction for the past 24 years. The Claybury Lunatic Asylum was the first asylum opened by the London County Council, and was also the first establishment to try the care and treatment of private patients under municipal control.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS

The Autumn Recess

BOTH Houses of Parliament adjourned on Wednesday, August 23rd, for an autumn recess. They reassemble on Oct 10th.

HOUSE OF COMMONS

WEDNESDAY, AUGUST 16TH

Medical Examination of Recruits

MR HARVEY asked the Financial Secretary to the War Office whether any detailed physical standard had been issued to the various Army medical boards to ensure that cases should be dealt with on uniform principles and, in particular, whether any instructions had been issued to secure a uniform method of dealing with organic diseases such as diseases of the heart.—MR FORSTER said in reply: The physical standard is fixed for each of the categories, and this standard is determined by the nature of the duties assigned to the particular category. Apart from this conference are from time to time held to secure co-ordination between the work and practice of the different boards.

MR HARVEY asked whether the examination of recruits by the various Army medical boards was inspected from time to time by competent medical experts.—MR FORSTER: Yes, sir, the Deputy Directors of Medical Service of the commands are responsible for inspecting from time to time the work of examining recruits.

Invalided Officers from Mesopotamia

Captain GRIMSBY GORE asked the Financial Secretary to the War Office whether he was aware that a number, about 20, of officers wounded or sick from Mesopotamia were invalided home to England on leave on medical certificate for limited periods of three or four months, leaving Bombay on a hospital ship on July 7th, 1916, were landed at Suez on July 18th, and were there informed that there would be no hospital ship to take them on from Egypt until August 20th, if then, whether these officers were kept at Alexandria in hospital until August 2nd, when they were informed that if they liked they could go by ordinary transport thence to Marseilles, and, on embarking on this transport, were compelled to sign a declaration certifying that, if a passage to England by transport was granted to them, they would pay all expenses incurred en route, including, if landed at Marseilles, the fare through France, that they were travelling by transport at their own request and risk, that they would not in future prefer any claim whatsoever for the payment of any expenses incurred during the journey to England, and that they were aware that they were allowed to stay in Egypt and await passage to England by hospital ship, but that if they did so they must stay in hospital or convalescent home and adhere to the rules of that institution, whether he is aware that the transport on which they travelled on these conditions also carried

officers not sick or wounded, on ordinary leave from Egypt, who were given free warrants across France and were forced to pay no expenses why this differentiation was made against officers invalided from the Mesopotamian front, and whether, seeing that the period of leave dated from leaving Bombay and no proper arrangements were made for transportation for these sick and wounded officers beyond Suez, he would see that their leave was extended for the time they were detained in Egypt—Mr FORSTER answered The statements made in the first three parts of the question are, I am informed, substantially correct so far as the information in the possession of the War Office goes As regards the fourth and fifth parts of the question, I cannot at present say precisely why the authorities in Egypt made these officers sign the declaration referred to, but I may inform my honourable and gallant friend that the question of reimbursing the travelling expenses and also extending leave will be sympathetically considered I may add that it is impossible to provide hospital ships in Egypt to meet the Indian hospital ships, and that patients from India have to be transferred to hospitals in Egypt until they can come on There has been a shortage of hospital ships in the Mediterranean lately owing to the heavy requirements arising from the operations in France, but this has now been remedied

Health in Military Camps

Mr BENNETT GOLDNEY asked the Financial Secretary to the War Office whether the Government had again refused to deal with the dangers to health to which Canadian and other soldiers were exposed in the neighbouring towns to military camps, whether, as these dangers must continue so long as the Government would take no adequate steps by legislation to keep sick undesirable women under surveillance and control until they were cured, he would take steps to provide suitable and sufficient hospitals for the victims of our present neglect and with this end in view, whether he would ascertain to what the present delay in carrying out the necessary work at Elham was due—Mr FORSTER answered There has been no refusal to deal with the dangers mentioned The matter is receiving attention and my noble friend the Under Secretary of State has recently held a conference on the subject

Elham Hospital

Mr BENNETT GOLDNEY asked the Financial Secretary to the War Office whether he would take the necessary steps to accelerate the work which had been considered advisable to undertake in connexion with the conversion of the union at Elham into a hospital for sick Canadian soldiers, whether he was aware that although the Government had now taken over the whole of this block of buildings, which it was estimated could accommodate some five to six hundred patients, arrangements were only in progress for the reception of 200 whether his attention had been called to the position of the present tent hospital for such cases as it was contemplated to send to the Elham institution, whether he knew that the men were now in immediate proximity to the much frequented and dusty high road between Hythe and Folkestone and that the tents and the patients were visible to every passer by and whether he would take steps to provide more suitable accommodation either in the buildings or grounds at Elham—Mr FORSTER replied The building referred to has been allotted to the Canadian authorities and they are making their own arrangements The Army Council have no information regarding any work contemplated or already undertaken at this hospital, but I will make inquiries

Treatment of Venereal Diseases

Major ASTOR asked the President of the Local Government Board whether any and if so how many councils of counties and county boroughs had not yet submitted to the Board any scheme for providing diagnosis and treatment of venereal diseases based on the recommendations of the Royal Commission in their report dated Feb 11th 1916 and promised by him on behalf of the Government to a deputation of the National Council for Combating Venereal Diseases on April 14th 1916—Mr LONG answered I am afraid that my honourable friend does not realise that it takes some time and consideration to evolve documents containing the technical and administrative details which the Department's order and circular comprise I am as anxious as he is that the scheme shall be set going, and I can assure him that there has been and will be, no avoidable delay

THURSDAY AUGUST 17TH

Supply of Cocaine to Dentists

Mr MCCALLUM SCOTT asked the Home Secretary whether if he was satisfied that novocaine was an effective substitute for cocaine he would make his restrictions with regard to the supply of cocaine apply equally to all dentists registered as well as unregistered—Mr H SMITH replied I see no grounds as at present advised, for applying the restrictions

to practitioners duly registered under the Dentists Act I would point out also that if registered dentists were prevented from using cocaine the supply of novocaine for the unregistered would be made more difficult

Mr MCCALLUM SCOTT Is there any reason why restrictions should apply to unregistered and not to registered dentists?—Mr SAMUEL Yes, because registered dentists are persons who are registered to receive cocaine, and unregistered dentists are not registered Any person can call himself an unregistered dentist

Exemptions from Vaccination

Mr CHANCELLOR asked the President of the Local Government Board whether, in cases where exemption from vaccination was granted for a child to the mother in the absence of the father on service in the Army, the father remained liable to penalties on his return home—Mr LONG replied My department has sent a circular letter to all vaccination officers impressing on them that it is their duty to accept as valid declarations made by the mother of a child in the father's absence from home on naval or military service

Outbreak of Fever at Lettermore

Mr O'MALLEY asked the Chief Secretary to the Lord Lieutenant of Ireland whether his attention had been drawn to the outbreak of fever at Lettermore in the Oughterard Union, and whether he would authorise an inquiry to be held with a view to ascertaining and removing the cause or causes of the periodic outbreaks of fever in this district—Mr DUKE wrote in reply Investigations are being made by the medical inspector of the Local Government Board with a view to ascertaining and, if possible, removing the cause of the outbreak of fever at Lettermore If further inquiry appears to be necessary it will be made

TUESDAY, AUGUST 22ND

Unfit Men in the Army

In the course of the debate on the motion for the adjournment of the House for the autumn recess, several honourable Members complained that numbers of men who were physically unfit had been passed into the Army

Mr LLOYD GEORGE (Secretary for War) said that, owing to the bringing of the Military Service Act into operation, it was almost inevitable that anomalies and hardships should have arisen The marvel was that in the light of these conditions so few should have arisen The men now going into the army were about the best we had since the beginning of the war No doubt amongst them were men not quite up to the average physical standard No doubt in certain cases mistakes might have been made by medical men, and it was quite obvious that there might have been cases of tuberculosis which were not at once detected On the other hand there were cases which had been let off which ought not to have been let off It was only fair that before cases were brought up in the House of Commons, the opportunity should first be given to the War Office to set matters right The military authorities certainly did not wish to get men physically unfit passed into the Army

Births, Marriages, and Deaths.

BIRTHS

TURNER.—At Dene House Ellison place Newcastle-on-Tyne on the 16th inst the wife of Major G Grey Turner R.A.M.C. (T.F.) of a son

MARRIAGES

OUR CURRENT NUMBER

Being almost exclusively devoted to information especially interesting to Students we are necessarily compelled to defer the publication of communications on other important subjects

We tender our best thanks to the gentlemen who have at considerable personal trouble kindly supplied us with the returns and prospectuses upon which the information given in this Students Number of THE LANCET relative to the various medical examining bodies in Britain and medical schools of the United Kingdom is based We regret that in some cases however owing to proofs having been either late or defective or to late corrections in inaccuracies may be found.

MANAGER'S NOTICES

ALTERATION OF INLAND SUBSCRIPTION RATES

OWING to the alteration in the Inland Newspaper Postal rate, the postage on each copy of THE LANCET will in future be 1d., and sometimes 1½d.

The revised Inland Subscription rates are —

One Year	£1 3 3
Six Months	0 13 8
Three Months	0 7 0

The rates for the Colonies and Abroad (thin paper edition) will be as usual —

One Year	£1 5 0
Six Months	0 14 0
Three Months	0 7 0

Subscriptions (which may commence at any time) are payable in advance. Cheques and Post Office Orders (crossed "London County and Westminster Bank, Covent Garden Branch") should be made payable to the Manager, Mr CHARLES GOOD, THE LANCET OFFICES, 423, Strand, London, W.C.

An Experimental Study OF LATENT TUBERCULOSIS

By CHUNG YIK WANG, M.D., B.Sc.,

CARNEGIE RESEARCH SCHOLAR FORMERLY MCCORMY RESEARCH SCHOLAR

(From the Royal College of Physicians Laboratory,
Edinburgh)

Latent tuberculosis, in a sense other than that applied clinically, may be defined as an infection of the body with tubercle bacilli without the infection showing a specific development—that is a new formation or change of tissue, which can be recognised by macroscopic or microscopic examination.

The present research was undertaken with a view to determine the presence and frequency of this form of tuberculous infection in adults and in children, and for this purpose my investigation has been directed to post-mortem cases which presented to a careful examination by the naked eye no evidence of tuberculous lesions anywhere in the body.

Method of Investigation

The material chosen for this inquiry was furnished by lymphatic glands such as those of the cervical, bronchial, mesenteric, or retroperitoneal groups, which, on gross examination, either presented a healthy appearance or only showed a simple enlargement without being visibly diseased. These glands were dissected from the body, and, as a precautionary measure for destroying the organisms acquired secondarily during the process of conducting the post-mortem examination their surfaces were carefully seared. The material from different sites, after such preliminary treatment was then separately emulsified in the following way. It was cut up into minute pieces with scissors and ground to pulp with a pestle in a porcelain mortar, normal physiological saline was then gradually added, while the grinding was continuously kept up until a fine emulsion was formed. This was filtered through muslin to strain off the coarse particles the filtrate so obtained being then inoculated into the animals.

Guinea pigs were employed in every instance for the detection of tubercle bacilli and the intraperitoneal method of infection was with few exceptions, that adopted. The animals, if they did not die prematurely, were killed at the fifth or sixth week after inoculation, and a careful post-mortem examination was conducted with a view to determine the presence or absence of tuberculous infection.

Results of Investigation

My study, in the attempt to throw light on the subject of latent tuberculosis in the meaning defined, comprises 32 cases which were found free from tuberculosis at necropsy and, also, subsequently on microscopic examination of a section of the glands employed for the test. I investigated four other cases which are not included for the following reasons: in one, a section of the glands submitted to the test showed definite tuberculous lesions microscopically, though giving no indication of the disease to the naked eye, in the second case, the guinea pigs inoculated with the material all died prematurely, the remaining two cases were also excluded as the material utilised for the study was furnished by glands which subsequently on further examination were determined to be affected with malignant disease though showing only a simple enlargement at the necropsy.

For descriptive purposes the cases can be conveniently divided into two groups: one of adults and one of children. The adult group consisted of 18 cases constituted as follows—

Seven cases in each of which the cervical bronchial, and mesenteric glands were separately studied.

Five cases in which the mesenteric glands alone were studied.

Three cases in which the bronchial glands alone were investigated (One case also includes the glands along the pancreas).

One case in which the cervical and bronchial glands were separately tested.

One case in which the cervical and mesenteric glands were separately examined.

One case in which the cervical glands alone were determined.

No 4853

The other group that of children, consists of 14 cases as under—

The mesenteric glands from nine cases

The cervical and mesenteric glands from each of three cases

The cervical, bronchial, and mesenteric glands from one case

The bronchial glands from one case

On the result of animal inoculation, the material from 2 out of 18 cases of adults and from 1 out of 14 cases of children was proved to be tuberculous.

A summary of the 32 cases into a tuberculous group (Table I) and a non tuberculous group (Table II) is given below.

TABLE I.—Three Cases showing neither Macroscopic nor Microscopic Evidence of Tuberculosis, but Proving to be Tuberculous on Animal Inoculation

Ref No of case	Sex	Age	Nature of disease	Source of material for inoculation	Nature of material.
25	M.	55	Pericarditis nephritis	Cervical gl.	Slightly enlarged.
52	F	51	Heart disease lupus erythematosus	Glands near pancreas.	Swollen, congested.
54	M.	34	Osteomyelitis.	Mesenteric gl	Soft, congested.

II.—Twenty nine Cases showing no Evidence of Tuberculosis on Naked Eye and Microscopic Examination, and on Animal Inoculation

3	M	43	Injuries to spine	Cervical gl. Bronchial gl. Mesenteric gl.	Slightly enlarged. Enlarged, pigmented Healthy
4	M	39	Lobar pneumonia.	Cervical gl. Bronchial gl. Mesenteric gl.	Slightly enlarged Normal.
6	F	36	Myocarditis.	Cervical gl. Bronchial gl. Mesenteric gl.	Enlarged pigmented Slightly enlarged
7	F	22	Eclampsia.	Cervical gl. Bronchial gl. Mesenteric gl.	Normal Slightly enlarged
9	F	64	Heart disease.	Cervical gl. Mesenteric gl. Bronchial gl.*	Normal —
10	M	44	Burns	Cervical gl.* Bronchial gl. Mesenteric gl.	Enlarged congested. Normal.
26	M.	44	Bronchitis	Cervical gl. Bronchial gl.	Enlarged pigmented
30	F	10	Splenic anemia.	Cervical gl. Bronchial gl. Mesenteric gl.	Enlarged. Greatly enlarged
31	F	16	Heart disease	Bronchial gl.	Enlarged oedematous
36	F	13	Meningitis, pericarditis.	Cervical gl. Mesenteric gl.	Greatly enlarged. Moderately enlarged.
41	F	19	Heart disease	Mesenteric gl.	Slightly enlarged
42	M	23	Intestinal obstruction.	Mesenteric gl.	Moderately enlarged
43	M.	11	Cerebral hemorrhage.	Mesenteric gl.	Enlarged
55	F	29	Peritonitis	Mesenteric gl.	Several enlarged.
56	M	22	Diabetes	Mesenteric gl.	Many enlarged.
58	M	10	Bronchopneumonia	Cervical gl. Mesenteric gl.	Enlarged "
61	F	12	?	Mesenteric gl.	Generally enlarged
62	M.	13	Osteomyelitis.	Mesenteric gl.	
63	M	3	Pneumonia	Mesenteric gl.	Some enlarged.
69	F	7½	"	Mesenteric gl.	Enlarged.
79	F	52	Lymphadenoma (?)	Cervical gl.	Greatly enlarged
87	F	3	Bronchopneumonia	Mesenteric gl.	Enlarged
88	M	32	Bronchopneumonia	Mesenteric gl.	A few enlarged
90	M.	1	Intussusception	Mesenteric gl.	Generally enlarged
92	F	7	"	Cervical gl. Mesenteric gl.	Markedly enlarged. Enlarged, massed together
93	M	20	Syphilis (?)	Cervical gl. Mesenteric gl.	Enlarged pale
102	M	3½	Heart disease	Bronchial gl.	Enlarged
116	M	7	Heart disease.	Mesenteric gl.	One enlarged
117	M	23	Heart disease	Bronchial and mediastinal gl.	Enlarged congested.

* Animal died prematurely
K

As already mentioned, in none of these 32 cases was there any evidence of tuberculosis in the body either on naked eye or on microscopic examination. Hence it may be stated that 3 of my 32 cases were undoubtedly instances of latent tuberculous infection, in which living tubercle bacilli were demonstrated in the tissues of the human body by means of animal test, and yet *in situ* these produced no changes detectable by the naked eye or the microscope.

The following is a summarised account of the three cases of latent tuberculosis —

(a) CASE 25 — The patient, a male aged 56, died from heart disease. At the post-mortem examination none of the organs were affected with tuberculosis. The cervical and mesenteric glands were slightly enlarged, while the bronchial glands presented a normal appearance. The guinea pigs inoculated with the cervical glands developed tuberculosis, those with the bronchial and mesenteric glands remained healthy.

A culture isolated from the cervical glands, which showed histologically only some congestion, was of the human type. (The criteria I used in the identification will be described in a paper to be published shortly in the *Journal of Pathology and Bacteriology*.)

(b) CASE 52 — The case was that of a woman, aged 61, who died of a terminal pneumonia following lupus erythematosus. At the necropsy no trace of tuberculous lesions could be discovered in the body. None of the glands showed any signs of disease, except that along the aorta and pancreas a few were simply swollen and congested. Sections of these glands showed, on microscopic examination, diffuse fibrosis and pigmentation. A culture raised from the glands mentioned belonged to the human strain.

(c) CASE 54 — The patient, a boy 3 years and 6 months old, died from acute osteomyelitis of the tibia. Numerous abscesses of the lungs were found on post-mortem examination, while the other organs showed extremely cloudy swelling. Other than enlargement and congestion of some of the mesenteric glands, there were no changes detectable in the glands. A microscopic examination of the mesenteric glands employed for the test failed to reveal any signs of tuberculosis. A culture isolated from the mesenteric glands was identified to be of the human type.

A review of the literature on this subject furnishes the following results of previous observers.

Orth,¹⁴ as early as 1879, pointed out that glands, though normal in naked-eye appearance, may show tuberculous changes on histological examination, and he was probably the first to demonstrate the existence of such lesions in the tissues of the human body in conditions where they were undetected by the unaided eye.

This view was subsequently corroborated by Loomis,¹⁵ who demonstrated that glands which did not present to the naked eye any evidence of disease and were therefore considered normal, could give rise to a tuberculous infection in animals on inoculation. This author used for his experiments the bronchial glands from adults.

In the following year further confirmation was found in the investigation of Pizzini,¹⁶ who showed that out of 30 cases of adults in whom no tuberculous lesions could be ascertained, 12 (10 with the bronchial and 2 with the bronchial and cervical glands) were found infected with tubercle bacilli, on submitting the glands to the animal test.

Eastwood and Griffith,⁵ in the course of their investigation into the incidence and bacteriological characters of tuberculous infection in children, have studied 150 cases in children. Among these were 61 cases, showing at the post-mortem examination neither evidence of infection with tubercle bacilli nor visible lesions of tuberculosis. In every case excepting one (in which the cervical glands were also included) the bronchial and mesenteric glands were separately studied by inoculating each group into guinea pigs. Of the 61 non tuberculous cases, 5 produced tuberculosis in the inoculated animals, the tubercle bacilli isolated being of the bovine type in three instances.

Stanley Griffith⁷ has also studied, by means of animal inoculation, the bronchial and mesenteric glands of 33 children who showed at necropsy no macroscopic evidence of tuberculosis. In one of two further cases the bronchial glands alone, and in the other the mesenteric glands alone, were investigated. Exclusive of one case, in which all the guinea pigs inoculated died prematurely, out of the groups of these glands belonging to 34 children two produced tuberculosis in the guinea pigs inoculated, and in each instance it was the bronchial gland group. The cultures obtained from these two cases were of the human type.

There was no record of a histological examination of the glands being undertaken by the last four observers, hence their cases cannot be identified with conclusiveness as instances of latent tuberculosis in the sense above defined.

Our definite knowledge, probably the first, of the occurrence of latent tuberculosis appears in the communication of Kaebler,¹¹ who mentions that two cases (one aged 41 years the other 5½ years) out of 23, in which normal bronchial glands were used for the inoculation, converted tuberculous infection to the experimented animals.

Not long afterwards this subject was further investigated by MacFadyen and MacConkey,¹² who examined a series of mesenteric glands from 28 post-mortem cases, all of which, excepting one of 6 years and another of 8 years old, were under 5 years of age. The 28 cases, based on a gross examination at necropsy, were divided into two groups, tuberculous and non tuberculous, the former numbering 8 cases, while the latter numbered 20 cases. Of the non tuberculous cases, 5 were proved to be tuberculous on animal experiment, and in 2 of these a histological examination did not demonstrate the presence of any tuberculous lesions.

More recently additional investigations on this subject have been recorded. Rosenberger,¹³ in his inquiry involving a study of the mesenteric glands in 21 non tuberculous cases which showed no tuberculous changes histologically, found that 6 (4 adults and 2 children) out of 14 cases were capable of transmitting tuberculosis to the inoculated animals.

Harbitz⁸ examined at necropsy 142 cases of children and found that 18 of the 91 cases in which there was neither macroscopic nor microscopic evidence of tuberculosis, were tuberculous on animal test. The material giving this result was in 13 instances the neck glands. In the other 5 cases the result was produced by injection of the following: (1) tracheal glands, (2) neck and mesenteric glands, (3) mesenteric and retroperitoneal glands, (4) neck, tracheal, and mesenteric glands, and (5) neck and tracheal glands.

That latent tubercle bacilli may also be found in glands other than lymphatic glands has been recorded by Goodale⁹ in his report on the clinical examination of children with enlarged tonsils. These he examined from 9 cases of children, varying from 2 to 9 years old. The tonsils, before being inoculated into guinea pigs, were examined histologically in 7 instances. Of the latter cases, 2 showed no tuberculous changes either to the naked-eye or microscopic examination, yet they were instrumental in giving rise to a tuberculous infection in the experimental animals.

Ipsen,⁹ during the course of his examination of 102 cases of children, of which 74 were non tuberculous, was able to demonstrate the presence of such latent tubercle bacilli in the mesenteric glands of one case, aged 2 years. These glands on inoculation into guinea pigs produced tuberculosis.

Again Weber and Baginsky,¹⁰ in their investigation have been able to establish the presence of this form of latent tuberculosis in one case, that of a child of 2½ years old in a series of 26 children, ranging from 3 months to 12 years of age. This case showed neither macroscopic nor microscopic evidence of tuberculosis and the material capable of infecting the animals on inoculation was furnished by the cervical glands.

Bartel¹ has shown that in 8 out of 68 cases of children dying from measles, diphtheria, or scarlet fever, in whom there were no tuberculous lesions detectable, either by the naked eye or the microscope, the glands (cervical, bronchial, or mesenteric) were proved to be tuberculous on inoculation.

Other evidence has been furnished by the work of Rabinowitsch.¹⁶ This author mentions the case of a child aged 14 months, who died from broncho-pneumonia, the cervical and mesenteric glands from which, though normal in appearance in every respect, were capable of causing tuberculosis in the inoculated animals.

Further instances of this latency are found in Beitzke's paper.⁴ He showed that among 27 cases of children dying from disease other than tuberculosis 9 were tuberculous on animal test, the material employed being normal cervical, tracheo bronchial, and mesenteric glands.

Examples of quiescent tubercle bacilli are not only confined to the human body, for they have also been observed in animals by, amongst others, Rabinowitsch and Kempner.¹⁷

From the large amount of evidence accumulated one may draw the conclusion in spite of objections from certain quarters, notably that of Joest¹⁸ that the existence of latent tuberculosis in the human body in the meaning already defined, has been abundantly proved. Further by means of the animal test, it can be substantiated in a certain proportion of individuals otherwise not recognisable as tuberculous by the naked eye or the microscope, probably an average of about 12 per cent, as the appended table indicates with perhaps variations at different periods of life.

Bartel and Spieler³ lay great stress on the importance of a lymphoid or pre tubercular stage which is characterised by enlargement and swelling of the glands before there is any histological evidence of tuberculosis. How long tubercle bacilli may remain latent in the human body cannot be

determined on the present knowledge of the subject, but in the case of animals Bartel² has demonstrated that tubercle bacilli may reside in the tissues as long as 104 days without producing any specific changes. He used for his experiment rabbits and guinea pigs which were fed with human tubercle bacilli and found that the glands of the infected animals, though normal to the naked eye and microscopic examination, contained tubercle bacilli as was proved by their potency in producing tuberculosis in animals on inoculation.

Summarising the results obtained by the various workers and myself gives the following table

TABLE III

Authors.	Cases examined	Latent cases	Latent cases %	Glands in which latent tubercle bacilli were demonstrated		
				Cervical	Bronchial	Mesenteric.
Kæble	23	2	8.7	—	2	—

(a) Including 4 tonsils (b) Tonsils (c) Bronchial and retroperitoneal glands.

My deep indebtedness is due to Professor James Ritchie for suggesting the line of research, and for his kind supervision and helpful criticism and to Dr J P McGowan and Dr James Dawson for help generously given in many directions. To the pathologists past and present of the Edinburgh Royal Infirmary and of the Edinburgh Royal Hospital for Sick Children I wish also to record my sincere thanks for courtesy in providing me with material and in allowing me to have access to their post-mortem notes. I have also to thank the Laboratory Committee for all the facilities afforded me in the Royal College of Physicians Laboratory, Edinburgh and the Trustees of the Carnegie and the McCann Research Scholarships and of the Moray Research Fund for financial assistance.

A REPORT TO THE MEDICAL RESEARCH COMMITTEE

In addition to material collected at the Department of Pathology in Oxford, we refer in the following communication to details of material already published in outline by Dreyer and Torrens from the — Stationary Hospital British Expeditionary Force. For permission to make use of this material we are greatly indebted to the officer commanding, Lieutenant-Colonel Evans D.S.O., R.A.M.C. as well as to the officer then in charge of the bacteriological laboratory of that hospital, Lieutenant-Colonel Grattan, R.A.M.C., and his staff of workers.

The agglutinin reaction constitutes the most valuable guide which we possess for the diagnosis of the enteric fevers (typhoid paratyphoid A and paratyphoid B). For while direct cultivation from blood, faeces, and urine is, when successful, final and convincing, the percentage of cases in which positive results are obtained by culture methods does not at a liberal estimate exceed about 50 per cent. Among these cases will, of course, be also included carriers not actually suffering from active disease.

Unfortunately there appears to exist a belief that the introduction of protective inoculation against B typhosus and more recently against the paratyphoid bacilli also, has rendered the agglutinin reaction less reliable or less conclusive diagnostically than was formerly the case. This belief however is not justified by the evidence available, though it is undoubtedly the fact that the practice of inoculation has not only enhanced certain difficulties which already existed but also introduced some new difficulties of its own. As a result of this it is no longer possible to make use with advantage of certain methods largely qualitative in character which before were commonly considered adequate for diagnostic purposes. And it has become necessary to employ some accurately quantitative method. Moreover, since the diagnosis now depends on the results of a series of several (three or more) successive observations, the method used must be one whose results on successive occasions are strictly comparable *inter se* and can be expressed in definite and accurate measurements relative to some fixed standard. Such a method has the further very great advantage that wherever and whenever such tests may be performed they will form a part of a homogeneous statistical material. All these requirements are met by the method which has been rendered generally available in naval and military hospitals for the past 12 months by the issue on behalf of the Medical Research Committee of the standardised agglutinable cultures prepared in Oxford. But the diagnosis of individual cases could equally well be carried out by any other method of an accurately quantitative character if such method be in use.

The curious and widespread lack of appreciation which still exists with regard to the necessity for employing exact quantitative methods in performing agglutination tests in inoculated individuals has led to most remarkable and contradictory statements. Thus while C D Hamilton¹ for example declares that "a positive Widal reaction in any person who has ever been inoculated with the antityphoid vaccine is of no value in diagnosing typhoid fever" H L Tid² maintains that "a positive agglutination reaction to bacillus typhosus after the fifth day of pyrexia is as definite a proof of typhoid fever in an inoculated man as in a non inoculated one."

The answer to these statements is that the exact measurement of the agglutinin titre of inoculated persons by means of standardised agglutinable cultures shows that they are

RELIEF WORK IN ARMENIA.—The chairman of the Armenian Refugees (Lord Mayor's) Fund sends us an account of three months work in the devastated villages of Armenia from an eyewitness. Rev Harold Buxton, honorary secretary to the fund, who has just returned to England. It is urgently necessary that public opinion should be focussed on the position of these most unfortunate victims of the war. Mr Buxton confirms the terrible stories of their sufferings told in the House of Lords some months ago by Lord Bryce. Of the estimated 2,000,000 Turkish Armenians perhaps 1,000,000, the account goes, have been deported and 500,000 massacred. Only some 200,000 escaped into the mountains and so across to Russian soil. These are the people whom the fund is at present relieving and help must be available during the coming winter. The most urgent matter is now to repatriate them on their own lands. The address of the fund is 95 Victoria Street S.W.

equally erroneous. On the one hand, active infection can be diagnosed as well in typhoid inoculated individuals as in non inoculated persons, and, on the other hand the absence of inoculation agglutinins within the first 12 months or more after inoculation is a very rare occurrence in properly inoculated individuals, and is no more frequent in the subjects of pyrexial attacks than in persons who remain in perfect health.

These points have already been dealt with on several occasions by ourselves and others. There is, however, this difference as regards practical bearing between the views of Hamilton and Tidy—namely, that while Hamilton's contention, if accepted, merely leads to the result that about half the cases will go undiagnosed, Tidy's view would entirely vitiate all statistical material bearing on the protective value of antityphoid inoculation. Since, as we have stated before, the vast majority of all febrile attacks occurring in persons inoculated within a year or so would, if his conclusions were accepted, necessarily be diagnosed as typhoid fever. Now that a triple (typhoid, paratyphoid A, and paratyphoid B) vaccine is in general use in the armies at war, the questions at issue will acquire a steadily increasing importance. Accordingly, although we have already endeavoured to explain the fallacy of the contentions put forward by Tidy, his continued efforts to elaborate a defence of his views, his failure to produce evidence in support of them, and the misuse of the data published by ourselves and others into which he has been led, make it necessary for us to seek indulgence while we return once more to the examination of his contentions. We may add that were it not for the urgent practical importance of enteric diagnosis under existing conditions we should not have considered it at all necessary to deal further with statements so obviously at variance with the accumulated evidence of different observers as those put forward by Tidy.

H. L. Tidy's Contentions

We have already quoted one of Tidy's leading statements made at the discussion on paratyphoid fever at the Royal Society of Medicine.³ We now place in parallel columns the views which he put forward in *THE LANCET*⁴ in the early part of this year and our own replies based on evidence which we presented in the same journal.⁴

Tidy's Conclusions

'1 Inoculation agglutinins are diminished or entirely removed by febrile conditions. It is possible that they are converted into agglutinoids.

"2 In certain cases they may return but usually do not do so."

"3 A positive agglutination reaction to B typhus after the fifth day of pyrexia has the same value in an inoculated as in an un inoculated person.

"4 Immunity conferred by inoculation may be affected at the same time as the inoculation agglutinins.

Evidence presented by us to show that

'1 The febrile condition associated with paratyphoid fever does not cause disappearance of typhoid agglutinins from the blood of persons inoculated against typhoid.

"2 Other febrile conditions also in so far as they have hitherto presented themselves, do not cause disappearance of typhoid agglutinins from the blood of inoculated persons.

"3 The statement opposite is entirely erroneous. Its acceptance would lead to such deplorable results in diagnosis that we feel compelled to repeat its categorical denial.

inability or unwillingness to appreciate the meaning of numerically expressed scientific observations, and castigated us again, because, as he stated, we had failed to submit figures in disproof of his revised but equally fallacious view which, as a matter of fact, he has not himself as yet supported by any solid or significant evidence.*

Having thus briefly, but as we believe correctly, indicated the general character of Tidy's dialectic, we shall now try to deal as concisely as possible with the details of his arguments, and to show how completely he has misinterpreted the evidence.

On two different occasions Tidy applied two different processes to our figures. On the first occasion he compared the arithmetical mean of the numbers of standard agglutinin units found in normal inoculated individuals (Dreyer and Inman*) with the means of the numbers of the units found in inoculated persons suffering from paratyphoid fever or other febrile conditions. This procedure was fallacious for the following reasons:

1 The relatively limited number of observations given in each of our series showed an enormous range of individual variation, as, for instance, among 74 normal inoculated individuals a range from 30 to 1390 standard agglutinin units, in the case of 75 individuals suffering from paratyphoid fevers a range from 6 to 875 units, and in 33 cases of other febrile conditions a range from 6 to 433 units. They therefore constituted a material to which the method of taking means was quite inapplicable.

2 The normal inoculated individuals were not comparable as regards inoculation agglutinins with the febrile cases, since the former were examined within a comparatively short time of their inoculation, while the latter were only observed after the lapse of a much longer interval of time. This point is naturally fundamental, since, as is well known, the inoculation agglutinins steadily diminish from the period, within a few weeks of the date of inoculation, when their maximum is reached.

On the second occasion Tidy instituted a comparison between the values of the middle terms of the different series. This method, however, was equally unsuitable, and for the same reasons. Moreover, the fact that the figures which he arrived at by the method of means were widely divergent from those which he obtained by his second method of taking middle terms should have afforded him a mathematical demonstration of the fact that both these methods of comparison were inapplicable to the figures in question.

To make this point clear we place in parallel columns the results obtained by taking arithmetical means and by taking middle terms as done by Tidy.

TABLE I

Series	Averages arrived at by	
	Arithmetical means	Middle terms
Normal typhoid inoculated persons ..	238.91	139.01
Paratyphoid A occurring in typhoid inoculated persons	37.2	32.5
Paratyphoid B occurring in typhoid inoculated persons	150.3	75.0
Other febrile conditions occurring in typhoid inoculated persons	77.6	44.0

† Tidy gives these figures incorrectly as 225 and 138 respectively.

Now it is well known that unless the figure obtained by taking the arithmetical mean of a series of observations is approximately the same as the value of the middle term of the series, the material concerned cannot properly be used for the purpose of arriving at mean values. In the table above it is seen that only in one of the series (paratyphoid A cases) do these figures at all approach each other in value. In the paratyphoid B series the figure for the arithmetical mean is double that of the middle term of the series. And in the other two series the difference is enormous, though not quite so great. It follows that the arguments which Tidy bases on the mean values obtained from our figures by these two methods necessarily fall to the ground.

* Since the present communication was written it has come to the knowledge of one of us that Dr Tidy prepared his material for publication some eight months ago. Its non appearance hitherto has been due to circumstances beyond his control.

These three statements in reply to Tidy's conclusions were proved quite fully by the figures which we published. But shortly after the appearance of our contradiction Tidy, ignoring altogether the fact that this demonstration of the futility of his original contentions had been afforded, but at the same time tacitly abandoning all further effort to defend them, proceeded in a letter to the Editor of *THE LANCET*⁶ to re shuffle his cards. He then took up an entirely new position, but with such adroitness as to convey to the casual reader the impression that what he now put forward was actually the view that we had attacked. And he took us severely to task for having failed to offer evidence adequate to disprove this new theory which had not been before us when we wrote. Finally, by making considerable play with a totally inaccurate interpretation of the figures which we submitted he purported to show that they were really favourable to his view. Upon this letter a brief comment was written by one of us (E. W. A. W.), pointing out that Tidy had been entirely misled in his use of our figures. Tidy then replied in a new letter,⁷ which showed still more clearly his

That the inoculation agglutinins do not disappear as a result of febrile attacks we had already proved. And from what has just been said it is evident that our material cannot be made use of to support the view that they are diminished.

Tidy further states that if he applies a method of comparison which we ourselves made use of—namely, to take the presence of as much as 25 Standard Agglutinin Units of serum as an arbitrary standard of comparison—the normal inoculated individuals in Dreyer and Inman's series and to our series of cases, he finds that the febrile cases show a marked diminution in inoculation agglutinins, his limit of 25 agglutinin units was chosen by us as an arbitrary point of comparison as being very far above the level of typhoid agglutinins found in normal non inoculated persons who have not had typhoid fever, since such persons only very exceptionally exhibit the presence of as much as 25 standard units. It in no way represents a diagnostic limit. But this method of comparison was equally inapplicable as employed by Tidy for the reasons already given—namely that the normal individuals and the febrile cases constituted dissimilar materials owing to the fact that the 50 series were examined at very different times from the states of their protective inoculation. On the other hand, the material to which we applied this form of comparison was not subject to any such objection.

In this connexion we must advert to an astonishing statement made by Tidy in the course of his arguments—namely, that a serum titre of 100 Standard Agglutinin Units apparently corresponds to a 'positive' reaction in non inoculated persons. It is difficult to understand how so entirely fallacious a statement could commend itself to anyone acquainted with the ordinary limits which have been recognised for years as forming a reliable standard in the serum diagnosis of typhoid infection, and still less to anyone who had read attentively the communications which he undertook to criticise. For 100 standard units correspond to standard agglutination in a serum dilution of anything from 1 in 250 to 1 in 700 or 800 according to the sensitiveness of the particular standardised agglutinable culture employed. Whereas it is definitely laid down in the directions for the use of standardised agglutinable cultures which since the middle of July, 1915 have been issued from this department on behalf of the Medical Research Committee as follows: 'In non inoculated persons who have not had typhoid (or paratyphoid) fever agglutination in dilution of 1 in 25 justifies a strong suspicion of typhoid (or paratyphoid) infection. But the test must be applied again in the course of a few days to ascertain whether there is any change in the titre of agglutination. Marked agglutination in a dilution of 1 in 50 or more is (nearly always) diagnostic of active typhoid (or paratyphoid) infection.' That is to say that the presence of from 4 units to 10 units of agglutinin justifies strong suspicion, and the presence of 10 units to 20 units is (nearly always) definitely diagnostic. These limits of serum dilution were clearly stated by one of us (G. D.) as long ago as 1906,* and have been maintained in all subsequent communications, since all experience showed them to be fully adequate. It was on his account that we were able to deny Tidy's statement that a positive agglutination reaction to B typhosus after the fifth day of pyrexia has the same value in an inoculated as in a non inoculated person,† and that 'other febrile conditions cause disappearance of typhoid agglutinins. Since it has been shown normal non inoculated persons who have not had typhoid fever only very exceptionally exhibit an agglutinin titre of as much as 4 standard units while more than 93 per cent of the febrile cases' which we quoted had a titre of from 6 to 875 units per cubic centimetre of serum.

But Tidy further claims that the tables published by Oser and Torrens' in their first contradiction of his case, have distinctively less agglutinin than the normal inoculated persons. How he arrived at this conclusion from the data given we cannot conceive. But we can easily show that it is not the case by now giving as an example the data of the 129 paratyphoid B cases (from the 171 cases of paratyphoid fever, then referred to) in greater detail expressing the observations in Standard Agglutinin Units. This form of expression was not employed on the previous occasion because the tables as they stood contained ample evidence to refute the contentions then put forward by Tidy.

Table II A contains the individual observations summarised in the table published by Dreyer and Torrens from the — Stationary Hospital, British Expeditionary Force. In all the cases the *B. paratyphosus B* was isolated in the course of the disease. Tables II B and II C give the maternal

published by Dreyer Gibson, and Aunley Walker from the 3rd Southern General Hospital and Table II in the data for normal inoculated individuals obtained by Dreyer and Inman. All the data are expressed in terms of standard threshold agglutination units per cubic centimetre of the serum.

It is obvious on the most cursory inspection of these tables that it would be entirely irrational to attach any kind of value whatever to their arithmetical means or to their middle terms for the purpose of direct comparison between the different series, since they show a range of individual variation so extreme—as for example from 5 to 20 000 Standard Agglutination Units in a series of 149 observations.

To show how utterly irrelevant this method of comparison is for the figures in question, we give in Table III the figures representing the arithmetical means and middle terms of the series of observations recorded above, either individually or in various combinations. The entire lack of agreement between the value of the different arithmetical means and

TABLE III

Series	Average arrived at by	
	Arithmetical means	Middle terms
1 Normal typhoid inoculated person (72 cases)	238.9	139.0
2 Paratyphoid B observed chiefly during the acute stage (149 cases)	1146.8	462.0
3 Paratyphoid B observed chiefly during convalescence (33 cases)	150.3	75.0
4 All the cases of paratyphoid B taken together (224 cases)	968.1	235.5
5 All the cases of paratyphoid B and paratyphoid A taken together (255 cases)	791.9	200.0

the corresponding middle terms for each series of observations renders obvious the illegitimate character of such a method of comparison in the case of the observations concerned.

Nevertheless, it may be of interest to note for the benefit of anyone to whom the elementary principles of mathematics are unfamiliar what extraordinarily adverse evidence as to the validity of Tidy's views would be afforded by this erroneous method of comparison. Thus it is seen that the agglutinin titre in those cases of paratyphoid B fever which were for the most part examined during the acute stage of the disease yield an arithmetical mean 4.8 times as great as the arithmetical mean of the titres found in normal inoculated individuals. Expressed by middle terms the former series shows a titre 3.3 times as great as that in the latter. Assuredly there is here no evidence of diminution or disappearance of typhoid agglutinins as the result of the pyrexial attack. Similarly, when all the paratyphoid B cases are taken together the arithmetical mean of their agglutinin titres and the middle term are respectively 4 times and 1.7 times as great as the corresponding figures for the normal inoculated individuals. In the same manner, taking all the paratyphoid fever cases A and B together, the arithmetical mean and the middle term of their agglutinin titres are respectively 3.3 times and 1.4 times as great as in the case of normal inoculated individuals.

On the other hand, if we consider by themselves the cases of paratyphoid B fever observed chiefly during convalescence it is seen that the typhoid agglutinin titre of normal inoculated individuals is 1.6 times, or 1.9 times as great as that of the former, according as we take arithmetical means or middle terms. But this difference is an entirely artificial and meaningless one, since the cases of paratyphoid B fever observed in the acute stage have themselves a titre 7.6 times, or 6.3 times as great as that of convalescent cases according as we take arithmetical means or middle terms. There is therefore no evidence whatever in any of the data given above which lends the least support to Tidy's views. Moreover, our emphatic and repeated contradiction of his statement that inoculation agglutinins are removed or markedly diminished by pyrexial attacks, and that a positive Widal reaction after the fifth day of pyrexia has the same value in an inoculated as in an uninoculated person, is not based exclusively on the extensive material which has accumulated during the present war. It is in absolute agreement with the important and careful observations carried out by Grattan and Harvey, and Grattan and Wood some years ago in their investigation of paratyphoid fever in India. Thus Grattan and Harvey¹¹ showed that in undoubted cases of paratyphoid A fever in typhoid inoculated individuals (in which the bacillus was recovered from the blood) a marked increase in the agglutinins for B typhus was noted. They further stated that "these cases would have been diagnosed on the Widal reaction as mild cases of true enteric fever." In a later communication Grattan and Wood¹² repeated and amplified the foregoing conclusions, and laid particular stress on the danger of errors in diagnosis arising from this increase in inoculation agglutinins.

The fact of the matter is that the question whether the inoculation agglutinins are diminished at all or not after the

fourth or fifth day of pyrexia can never be settled finally by comparing different individuals. Since the range of individual variation is so enormous as regards the agglutinin content of the serum, whether in normal inoculated persons or in those attacked by fever, it can only be decided by following the serum titre of individuals during the acute infection by means of exact quantitative measurements capable of reduction to a constant standard so as to ascertain what are the changes which do actually occur in their agglutinin titres. This is done in all our cases as a matter of routine, since, as has been fully explained on a previous occasion (as well as in the directions for the use of Standard Agglutinable Cultures) it is necessary to do so in order to arrive at a reliable serum diagnosis.

The effect of the pyrexial condition associated with paratyphoid B infection is exemplified in the cases shown below in Table IV, which are taken from cases where the titre of typhoid agglutination was definitely affected by the febrile

TABLE IV—Paratyphoid B Fever in Typhoid inoculated Individuals

Case.	Day of illness	Standard agglutinin units per c.c. of serum		
		Typhoid	Paratyphoid A.	Paratyphoid B.
1	9	556.0	< 1.4	2060.0
	13	3700.0	< 1.4	10600.0
	17	13090.0	< 1.4	29400.0
	21	3700.0	< 1.4	16480.0

	32	25.9	< 1.4	470.0
3	10	46.3	< 1.4	583.0
	14	278.0	< 1.4	2940.0
	18	650.0	< 1.4	11180.0
	22	593.0	< 1.4	8240.0
4	9	481.0	< 1.0	583.0
	13	2960.0	< 1.0	7650.0
	17	3520.0	< 1.0	26400.0

attack. In other cases, as we have shown elsewhere the typhoid agglutination titre may remain unchanged or only slightly increased throughout the course of paratyphoid fever. But wherever the typhoid agglutination titre is affected at all the change produced is one of active rise, subsequently followed by a fall towards the former level.

When such rise occurs its beginning is either somewhat antecedent to, or synchronous with, the beginning of the rise in paratyphoid B agglutination titre. Its maximum is reached either before or at the time that the paratyphoid B agglutinins reach their maximum. And as seen from the examples given in Table IV, in cases where the typhoid maximum precedes the maximum of paratyphoid B agglutination the subsequent fall in typhoid titre progresses rapidly, while the paratyphoid B titre continues to rise sharply to its maximum. This maximum occurs between the sixteenth and twenty-fourth (usually the eighteenth to twentieth) day of the disease (as is also the case in typhoid fever and in paratyphoid A fever), after which the usual fall in paratyphoid B titre sets in.

The cases quoted in Table IV are a few examples from a long series. They prove clearly that there is no diminution or disappearance of typhoid inoculation agglutinins as the result of the pyrexial condition in paratyphoid fever. It follows that in view of the great mass of evidence produced by other workers, as well as by ourselves it is obvious that Tidy's startling conclusions, which we have been at pains to discuss in detail, are entirely erroneous. Moreover, he has not himself as yet offered any substantial body of data in their support. The real question at issue is a simple question of facts, and there we now propose to let the matter rest.

Abortive Cases of Typhoid and Paratyphoid Fevers

The occurrence of mild cases of enteric fever has long been recognised, and Woodruff and others have called special attention to the danger of neglecting these cases, which may only have slight fever lasting a few days. In practice they are often taken for other conditions, and are not uncommonly put down as febricula. Sometimes, as Osler and McCrae point out they may only be recognised through the routine Widal reaction. If these facts were true before the introduction of protective inoculation, still more must they be

true since the widespread introduction of inoculation against typhoid and the paratyphoid fevers

The effect of prophylactic inoculation is threefold firstly, it diminishes the incidence of these infections, secondly, it lessens the mortality among those infected, and, thirdly, it increases the proportion of mild and atypical cases among the latter. Now, in non-inoculated persons the diagnosis of mild cases is not difficult where the Widal reaction is employed as a matter of routine. But in inoculated individuals the mere detection of agglutinin is, of course without significance. Accordingly, all doubtful febrile cases of however short duration occurring in inoculated persons require a quantitative determination of their agglutinin titre for typhoid and paratyphoid bacilli on three or more successive occasions at a few days' interval before the presence of typhoid or paratyphoid infection can be excluded.

In a certain number even of the mildest cases of these infections the rise and subsequent fall in the agglutinin titre are so definite that the diagnosis could never be in doubt. But in other cases the rise and fall of the curve are much less marked, and differences of opinion may exist as to whether the case is one of active infection or not. In order to assist in the elucidation of such cases it may be stated that the following points are of importance in the interpretation of the agglutinin curves.

1 The maximum agglutinin titre of active typhoid or paratyphoid infection occurs between the sixteenth and twenty-fourth day of the disease, and most frequently about the eighteenth to twentieth day.

2 If the maximum is reached at what appears to be an earlier date it is important to institute a careful inquiry into the actual date of onset of the illness.

3 If it is clear that the maximum falls markedly outside the limits given above (day 16-24) a diagnosis of typhoid or paratyphoid fever should not be based on a rise in titre of only moderate extent—i.e., a 100 or 200 per cent increase in agglutinin titre. Because experience is not at present sufficient to exclude the possibility that a rise of this extent may be due to other febrile conditions.

4 In following out the titration of the patient's serum on several successive occasions it will frequently be found that the maximum has fallen between two dates of observations. And two successive observations at about the same level do not mean that the curve is stationary at this point but merely that the maximum has occurred between them. Similarly, if the two highest observations are at different levels, it does not follow that the highest titre observed represents the maximum of the agglutinin curve. But it does follow that the maximum has occurred between these points.

5 In inoculated persons among whom mild and atypical attacks of typhoid (or paratyphoid) fever are likely to occur with fever of perhaps only a few days' duration and with few if any of the usual symptoms the diagnosis of typhoid or paratyphoid fever must not be rejected without the most careful consideration. As far as experience at present goes if a regular rise and subsequent fall, even of only 100 or 200 per cent occurs in the typhoid (or paratyphoid) agglutinin titre of the serum and its maximum clearly falls between the sixteenth and twenty-fourth day from the onset of illness the case is likely to be one of typhoid (or paratyphoid) infection. And we must not be misled by the fact that the patient may be convalescent or quite well again long before the date when his maximum agglutinin titre is reached.

A METHOD OF DROP-MEASURING LIQUIDS AND SUSPENSIONS

(SUPPLEMENTAL NOTES AND NOTES ON APPLICATIONS)

By R. DONALD, B.Sc. N.Z., D.Ph. Ox.

(From the London Hospital Bacteriological Laboratory—
Professor W. BULLOCK, M.D. Aberd., F.R.S.)

REFERENCE to the various topics of the two articles—the article in *THE LANCET* of Dec. 4th, 1915, and this article—will be facilitated by the following summary of contents. The roman numeral refers to the article, the ordinary number to the paragraph.

Surface tension promotes accurate delivery by drops and hinders accurate delivery otherwise of small quantities of liquids. I, 1-3, II, 61. Outline of this drop measuring method. I, 4-17, II, 2. The conditions determining drop size briefly stated. I, 4, of II, 24. Tubing required. I, 6, II, 15. Drawing pipettes. I, 7. Gauging. I, 8. Testing drop-count of a liquid. I, 9. Especially by small measure flask. II, 23. Effect of drop rate on drop volume. I, 10, II, 26. Mercury plunger tube. I, 11, II, 64. A method of using the test. I, 11. Separator cylinder with Mariotte tube. I, 15, 16. Resistance in pipettes by capillary, cone valve, &c. I, 10, II, 17.

Apologia for the second article. II, 1-3. Fundamental physical phenomena. II, 4-8. Apparently these phenomena are misunderstood in some quarters. II, 9, 10. Errors in "Standard" dropping pipettes. II, 9, 10, 34-42. Corrective experiments. II, 12. Table of gauge sizes, Lancashire (i.e. Stabbs) and Morse, drops per c.c., c.mm. per drop. II, 20. Explanation of table. II, 19, 21, 15. Various liquids have various surface tensions. II, 22 *et passim* in the applications. Making and use of small measure-flask for checking drop count. II, 23. Acid fast marking with blue black ink. II, 23. Recapitulation of essentials for correct drop measuring. II, 24. Drop volume increases more and more rapidly as pipette slopes from vertical. II, 25.

List of applications of the method. II, 28. Bibliography of the method. I, 1, note, II, 28. Applications in stalagmometry and in viscosimetry. II, 29. In the Widal test. II, 30-33. Critique on the drop measuring part of "Standard" "Directions" and pipettes. II, 34-42. Micro-Wassermann technique. II, 43-55. Counting suspended bacteria and other cells. II, 56-66. General features of technique. II, 56. Staining bacteria in milk, in vaccines, in water. II, 58. Removing stain adsorbing salts. II, 59. Method of using oil immersion lens on stage micrometer. II, 60. Importance of direct bacteria-count of water and of milk. II, 61. Staining drop films of c.s.f. cells. II, 62. Blood dilutions. II, 63-65. Steady filling of hemocytometer pipette by mercury plunger tube. II, 64. Super liability of some red blood corpuscles. II, 66. Summary. II, 67.

In this and in the earlier article is described a simple method designed to make practically uniform drops of any required size "grow" readily in the serological or in the chemical laboratory, whereas hitherto practically accurate drops and those of a limited choice of sizes, have been produced only in the physical laboratory, or from some more or less mysterious "plant" raised in the physical laboratory. The physical principles underlying the method have been more or less widely known for generations, and full general acknowledgment is here rendered to the authors of scores of papers on the investigation of those principles.

2. This method of simply gauging the pipettes as required merely places in the hands of the ordinary laboratory worker the means of applying those complex component forces, or rather the resultant of them, to suit his purpose.

3. Inquiries made by correspondents and circumstances observed by me since the former article indicate the need for the early publication of these further practical details, introduced by a brief exposition of the fundamental phenomena on which a trustworthy method of drop-measuring must depend. The opportunity is taken of adding a few notes on some applications of the method.

4. *Fundamental physical phenomena*.—A small drop of water on a paraffined surface maintains its almost spherical form by surface tension—the force exerted on the surface layer of liquid molecules by all the molecules within that layer which layer consequently behaves as if it were an elastic skin, constantly tending to compel the liquid drop to take the shape that will allow it to have a minimum of surface that shape being, of course, spherical.

5. The amount of force exerted by the surface of a water drop varies inversely as its radius. The smaller the drop, the

more strongly is it braced together. This is illustrated by the observable fact that a tiny water drop on, e.g., paraffined paper is so "well knit" that its surface of contact with the paper is not noticeably flattened, while a large drop near it is so loosely knit that its weight forces it to take a characteristic flattened shape.

6 If the small water drop is allowed to roll off the paraffined surface on to a horizontal clean glass surface, the water will now forsake its spherical form and will extend its edge as widely as it can over the glass. Similarly, if a freshly drawn (i.e., clean) glass capillary is held vertical with one end dipping into clean water, the water will rise in the bore until the amount of the force exerted by the ring of climbing edge is balanced by the weight of the column of water raised. In a capillary of 0.34 millimetre internal diameter the column of cold water so raised is nearly 9 centimetres high, and it weighs about 8 milligrams. Accordingly, the circumference of the ring of climbing edge being 1.07 millimetres, the capillary force between water and glass is nearly 7.5 milligrams per millimetre of contact-edge.

7 Again, if a clean glass capillary of outer diameter 0.34 mm is fitted as the needle of a clean hypodermic syringe, filled now with water and held steadily vertical while its plunger is screwed slowly and steadily down till the pear-shaped drop with its small end clinging by a contact-edge of 1.07 mm round the outside of the capillary tube is just ready to fall, then the weight of that hanging drop is practically the same as that of the capillary column—namely, 8 mg nearly.

8 It is not surprising that the amount of capillary force exerted round the outer circumference of a tube with outer diameter 0.34 mm should be about the same as the amount of capillary force exerted round the inner circumference of a tube with inner diameter 0.34 mm. True, the weight of the drop that falls from a pipette of outer diameter 0.34 mm is, as shown on the table in par 20, only 7.6 mg. And, as a larger and yet larger pipette is tried, the weight of the drop falls, as is shown in the same table, more and more from the weight of the similarly corresponding capillary column. This defect is largely accounted for by the hemisphere of water left on the horizontal lower surface of the pipette as the drop falls. The defect in the case of the 0.34 mm pipette is not much more than $\frac{1}{4}$ per cent of the drop-weight, but with large dropping points it attains, as Guye and Perrot¹ found, 17 to 29 per cent of the hanging drop.

9 In the earlier article on this subject it was pointed out that the size of a drop of a given liquid yielded by a clean pipette is determined by the outer circumference of the pipette at the level where the contact-edge of the drop clings round the glass, the pipette being held vertical or nearly so, and due allowance being made for the rate at which the drop is detached and for the temperature. Strange it may seem that there should be need to enlarge on this topic and to emphasise the importance of the outer circumference in determining the drop-size. But no less a presumable authority than the writer of the article on the Wassermann reaction in Kolle and Wassermann's large work² has referred variations in the drop size of a given liquid to "the temperature, the outflow opening, and the more or less vertical holding of the pipette." And another apparently authoritative German article³ on drop-measuring also refers the drop-size especially to the size of the outflow opening. Moreover, in London two "Standard" pipettes, issued a few weeks ago to workers making an extensive Widal research, were found to have outer diameters 2.1 and 2.5 mm, and drop count per c.c., in carefully identical conditions, 31.7 and 25.4 respectively.

10 In arranging for the manufacture of "Standard" dropping pipettes it might seem prudent to pay rather more attention to the quasi-principle of the inner diameter than to the less authoritatively quoted principle of the outer diameter. For glass-blowers would probably not be able to secure simultaneous equality of the two diameters, unless at considerable expense for unsuccessful work. But such prudence would tend to be disastrous to the accuracy of work done with such "Standard" pipettes.

11 True the outflow opening determines the drop size when the liquid does not wet the pipette, e.g., when the

liquid is mercury in a glass pipette, or when it is wax dropping through a hole freshly pierced in a paraffin plugging the pipette mouth.⁴ Also the outflow opening might be said to determine the drop size when the pipette nozzle is of material so thin that the inner diameter is almost equal to the outer diameter, as in Thomas Talpipettes.⁵

12 But that the outer diameter is the diameter concerned in determining the drop-size is indicated by the physical phenomena just described. The indication is strong supported by hundreds of observations made in an investigation of the drop measuring method of this paper. But pipettes ordinarily used in the investigation were made of ordinary glass tubing, which in its various sizes has roughly the same proportion of inner to outer diameter. Accordingly there might be made the suggestion that the drop-size determined really by the inner diameter, though the outer diameter also thus happens in these ordinary pipettes to be proportional. But the following simple experiments show that when the drop rate is duly regulated the drop-size is freely independent of the internal diameter.

(1) Pipettes from tubing of considerably different proportions drawn out and cut at the same gauge give practically the same sized drop. Ordinary tubing of outer diameter 4.5 mm and inner diameter 0.3 mm drawn and gauged Morse 74 (0.572 mm diameter) gave at 15°C 84.5 drops per c.c. Next, small thick-walled tubing 2.3 mm in outer diameter and 0.6 mm in inner diameter drawn and gauged Morse 74 and then welded to a pipette body of convenient size gave in similar circumstances 84.3 drops per c.c.

(2) A still more severe test was performed with dropping points of a large size, Morse 38, 2.53 mm diameter. First, a piece of ordinary tubing drawn out and cut at the size yielded drops of 0.04 c.c. Next, a solid glass rod of this size, supplied at the same slow rate with water trickling down its surface from a fine capillary held some 2 or 3 cm above the point, was found to yield drops of the same size 0.04 c.c.

13 As to methods hitherto used for making quick pipettes of required drop size, experienced workers may have individually acquired the art of drawing pipettes that give drops of one more or less uniform size, especially when they have the use of one size of tubing and one particular burner. But of formulated methods I have met only one mentioned by Dopfer and Saquépée,⁶ in their compendious volume "Widal recommends drawing out in the flame a glass tube and breaking at the middle of the drawn out part to get two equal pipettes." But in ordinary hands this method may give very unequal results, even for a single pair of pipettes.

14 The method of this article yields readily any number of closely uniform pipettes of any required sizes. Detailed directions for making the pipettes are given in the earlier article under this head.⁷ To these a few hints may be added.

15 Capillaries drawn from ordinary tubing 6 mm external and 3.5 mm internal diameter are more correctly gaugable than are thicker-walled capillaries: they are thin enough to have their elastic outline reduced, at the moment of gauging, by moderate pressure in the gauge-hole, from a possible oval to the circle of the same circumference. Then, although the drop-size is determined, strictly speaking, by the circumference of the capillary a short distance above the gauge-hole—that is, by the circumference where the contact edge clings round the glass—yet the practically negligible error due to the taper can be reduced by reducing the taper—i.e., by gauging only nearly cylindrical portions of capillary. Sizes intermediate between two gauge sizes may of course be obtained by cutting the capillary at a point between the "points" engaged by those two gauge holes. The Lancashire (or Stubbs) gauge affords some sizes intermediate between Morse sizes (of par 21).

16 For steady dropping by test from a pipette—especially from a wide capillary with not much resistance—good control of the test, e.g., by the method prescribed in par 11 of the previous article, is important.

17 To provide suitable resistance in a wide bore pipette the proximal part of the capillary may be suitably stenosed

⁴ A Wright multiple dilution pipette wetted inside while hot with melted paraffin and then shaken to expel all but a coating will deliver complete e.g. the drop of known size taken up for calibration.

by heating it in a Bunsen by pass flame, or better, a cone valve may be formed by dropping in stalk first a pear shaped drop of glass with a straight pointed stalk. Such a cone-valve can be easily pushed or shaken out if the pipette is to be washed out

18 The principal difficulty in the application of drop-measuring to general laboratory purposes is the fact that different liquids have different surface tensions. For this fact due allowance must be made. The worker must know what error is involved in using the same size of pipette for two different liquids and he must know how to allow for errors of practical importance, either by making calculations, if he and others concerned are fond of calculations, or else by being able to adapt his pipettes to his requirements

19 The table forming par 20 worked out afresh by hand dropping at about one drop per second and at about 20°C from capillaries nearly cylindrical, affords a useful selection of pipette sizes and values. Indeed, it forms as it were a keyboard on which may be found more than one set of pipettes harmonising to suit the liquids of various surface-tensions concerned in a test. The keyboard might be extended, but smaller wire-gauge holes would be expensive to standardise, and pipettes larger than about Morse 45 are not easily drawn with ordinarily available burners

20 Gauge No	Diameter in mm		Morse	
	Stubb*	Morse	Drops per c.c.	C mm per drop

35	—	—	4.2	238.1

21 The table illustrates the statement made in the earlier paper that small differences of dropping point diameter here proportion 1 difference of drop-count. Thus though taking widely different sizes M 76 with diameter 0.508 mm has drop-volume 11.1 c.mm and M 60 with diameter 1.016 i.e. 0.508 x 2 mm has drop-volume not 22.2, but only 19.8 i.e. now taking small differences Lancashire 79 diameter 0.355 which has its diameter half way between Morse 80 (0.343 mm) and Morse 79 (0.363 mm) will be found to have its drop-volume (7.63 - 8.20) i.e. 7.9 c.mm and its drop-count (131 + 122) i.e. 126.5 similar M 41 (2.413 mm) has its diameter larger than

M 42 (2.375 mm) by 0.038 mm, while M 41 (2.438 mm) has a diameter larger than M 42 by 0.063 mm. So L 41 will have a drop-volume larger than M 42 by 38/63 of (39.68 - 38.76), i.e. by 38/63 of 0.92 i.e. by 0.55. Thus L 41 has drop-volume 38.76 + 0.55 i.e. 39.3

22 Various organic liquid compounds and solutions of organic substances as used in serology have surface tensions less than that of water, and accordingly have their drop count from the same sized pipette greater than that of water. Whereas mere suspensions as of washed red blood corpuscles or of bacteria free from albuminoids and extractives, have practically the same surface tension and the same drop-count as the suspending saline has. Thus a typhoid culture washed off with saline from an agar slope without "condensation water" and immediately pipetted off, has nearly the same drop-count as saline while, if allowed to remain on the agar for an hour or so, it takes up peptone and extractives so that its drop-count factor in one hour is about 1.1 in seven hours 1.14, and in three days 1.2. The addition of about 4 per cent of formalin to a typhoid suspension raises its drop-count factor by about 0.01, e.g. from 1.14 to 1.15

The following may be used as further drop-count factors —

Water	1.0	Serum, guinea pig	1.06
Saline	1.0	Cerebro-spinal fluid	1.02
Serum human	1.1	Peptone broth	1.2
Serum human, inactivated	1.1	"Standard Agglutinable Typhoid Culture"	1.2
Serum human 1 in 4 dilution	1.03	Alcoholic antigens	2.5
Serum rabbit, inactivated	1.09	Antigen "1 in 15 c complement 1 in 24"	1.16

23 For exact drop-measuring the worker ought to check his technique by the simple plan of dropping into a small measure flask of about 1 c.c. capacity. The purchasable 1 c.c. measure-flasks, with long neck only 3 mm internal diameter, jam intolerably with watery liquids. But a useful measure may easily be made from tubing 7 to 7.5 mm. outer diameter. One end is closed hemispherical. Then at a suitable distance, judged according to the length that 1 c.c. of water occupies in that tubing a narrow zone of the tube is heated—e.g. by revolving it in a large bypass flame—and is then drawn to a constriction about 8 mm long and 4 mm inner diameter at its narrowest. Next the tube is cut off about 1 cm above this neck and is funneled out while soft-hot with a hot pointed negative (coreless) carbon. Such a neck, if kept free from grease will not jam with a drop if the measure is supported at about 30° from the vertical and if the drops are delivered on the lower slope of the funnel. The measure is now filled shaken out, and "tared" wet-empty. Then it is filled to near the narrowest part of the neck with water which is on the scale-pan adjusted by a fine pipette to 9/10 or 4/5 or 3/4 of a gramme—i.e. to such a fraction of a c.c. as will allow ready calculation of the drop count per c.c. On the measure held without undue warming, a scratch is made at the lowest point of the meniscus. Before heating black hot to anneal the scratch the mark may be filled with ordinary blue-black ink, dried and rubbed off level with hard smooth paper. When heated the ink is fast to all ordinary solvents. In cleaning the measure or the pipettes traces of greasy matter may be removed by first swabbing or even rinsing with solution of caustic alkali in "industrial spirit" and then rinsing with tap water.

24 Recapitulating before considering some applications of the method—We have seen that for practical correctness in drop-measuring due attention must be given to the following six matters. 1 The outer diameter of the pipette nozzle. 2 The practically vertical position of the pipette nozzle. 3 The drop-rate. 4 The surface-tension of the liquid. 5 The temperature. 6 Due checking of the technique by means of a 1 c.c. measure flask.

25 Of fundamental importance is the outer diameter of the pipette nozzle or, more correctly the horizontal length of the circular or oval ring of contact-edge where the drop clings round the glass. Is the pipette nozzle declines from the vertical the circle of contact becomes an elongated oval. The long diameter of the oval is proportional to the secant of the angle of declination from the vertical. Now

* Simple black glass tubing on ordinary slides will after heating face down over a Bunsen flame till quite black and rubbing while on the other side of the film which during the heating ought of course to be sloped down from the flame

the secant increases very slowly at first, but more and more rapidly as a right angle is approached. As the secant increases only 1 per cent in the first 8°, the oval periphery and the drop-volume will be found to increase still more slowly in that range. But even at 45° from the vertical the secant increases some 16 times faster than near the vertical, and the oval periphery, consequently also the drop-size, will increase at nearly that rate.

26 The importance of the drop-rate and the ways of securing uniform drop-rate have been pointed out in the two articles. The actual variations of the drop-count as the drop rate varies are shown in a table on p. 201 of the *Proceedings of the Royal Society B*, vol. lxxxvi (1913). To this table may be added that a Morse 80 pipette that gave at 1.3 seconds per drop 134 drops per c.c. gave at 10 seconds per drop 141 drops per c.c.

27 The rise of temperature lowers the surface tension of water about $\frac{1}{4}$ per cent per 1° C., and consequently lowers the drop volume similarly.

28 Some applications of the method may now be briefly described. These were mentioned thus in the original brief report to the Royal Society—

(i) Comparison of surface tension of liquids, in quantity as little as $\frac{1}{4}$ cc, e.g. in testing the value of the *meiostagmin* reaction in syphilis.

(ii) Measurements of various small quantities, in e.g. Wassermann reaction, micro-Wassermann reaction, and other complement-fixation tests. Widal reaction, alkalimetry, acidimetry, and other volumetric tests, testing cultures and disinfectants, and in pharmacy.

(iii) Direct estimation of cells numerically and qualitatively, in small drops of cerebro-spinal fluid.

(iv) Blood count, red cells and white cells, from drops of diluted blood.

(v) Direct counting of bacteria in small dried drops of diluted vaccines, distilled water, domestic water, sewage effluent, diluted milk.

Even at that time the method had shown itself efficient in the trials that had been made of it in those applications. Between then and the outbreak of war opportunity occurred for further working out of item v,¹² and then item iii, item ii, and incidentally and partially item iv.¹³

29 For the comparison of surface tension in serum and in other liquids an efficient *stalagnometer* may be formed of a $\frac{1}{4}$ c.c. pipette with gauged small dropping point under control of the constant-pressure apparatus described in the *Proceedings of the Royal Society B*, lxxxvi, 198-202. In testing the *meiostagmin* reaction each serum and each cerebro-spinal fluid had its own pipette and dropping point used before and after incubation. The constant-pressure apparatus together with capillary tubes, gauged internally by the wire gauge through the intermediary of a set of sewing needles, seems to form a useful *viscosometer*.

30 A few suggestions may now be made on

The Application of Drop-measuring to the Widal Technique. The first requisite is to have reliably though simply formed pipettes. The second is to use them with reasonable accuracy in allowing for the differences in surface tension or at least in "drop count." The surface tensions of two liquids are, of course, compared by their drop-weights—i.e., by the product of drop-volume and specific gravity, not simply by the drop-volumes of those liquids yielded by the same or by equal pipettes. But in ordinary serological work the strength of a dilution, of, e.g., serum, is reputed on the respective volumes of the ingredients before mixing. Accordingly, specific gravity may be disregarded. The differences in drop count by the worker's particular technique may be easily observed by dropping into a small measure flask such as is described in par. 23.

31 In the short list of comparative drop-counts and in the commentary on them as given in par. 22 may be found several data that must be taken into account in any Widal technique using drop-measuring, especially in view of the possibility of even recognising the day-by-day rise of a Widal patient's serum titre and in view of the accuracy that a careful worker may possibly attain with graduated pipettes when considerable quantities of serum are available.

32 In that list the average drop count of human serum is given as 1.1 times that of water or of saline. Accordingly to make a 1 in 10 dilution when only about one drop of serum is available we might, with our one pipette washed and dried, measure out one drop of the serum, and then with the same pipette, once more washed, we might measure out not 9 but 8 drops of saline, the 8 drops of saline amounting to 8.8 times the volume of the one drop of serum. But instead of all this washing we keep for the saline an M 77 pipette, for the diluted serum another M 77 or several such, and for each undiluted serum we use a dry small M 76 with body some 3 cm. long of small tubing about 3 mm. outer diameter, costing little in glass or in making, and washable if necessary.

33 Then, in view of the progressive fall in surface-tension of a saline suspension remaining for some hours on an agar slope, reasonable care ought to be taken to secure uniform surface tension in the various suspensions. Even if the typhoid suspension has "drop count" 1.2, and consequently drop-volume $1/1.2$ that of water, we may make accurate allowance by taking of it the same number of M 74 drops (12.0 c.c. mm. of water or 10 c.c. mm. of suspension) or half the number of M 55 drops (nearly 24 c.c. mm. of water or 20 c.c. mm. of suspension). It seems as easy to have three pipettes of different sizes as to use three pipettes for different liquids. They ought, of course, to be marked. These sizes of pipette are convenient, e.g., for setting up dilutions in powers of 2, thus: We take serum 2 M 76 + saline 6 M 77, making 1 in 4. Of this into control tube and tubes 1 to 3 M 77 0, 4, 2, 1, and also one drop into saline 7 M 77, making 1 in 32. Of this into tubes 4 to 6, M 77 4, 2, 1. Next into control tube and tubes 1 to 6, saline M 77 4, 0, 2, 3, 0, 2, 3. Finally typhoid suspension 2 M 55 into each of the 7 tubes. Thus we have dilutions of 1 in 2 to 1 in 256. Or again, if we take serum 1 M 76 + saline 7 M 77, we may put into tubes 1 to 3, M 77 4, 2, 1, which when completed as above will give 1 in 16 to 1 in 512.

34 As regards the drop-measuring part of the "Directions" for the "Use of the Standard Agglutinable Cultures" and the pipettes used for the technique it seems a public duty to point out some serious inaccuracies in them. For months past these directions and pipettes have been widely distributed, and apparently no modification of the "Directions" has yet been issued.

35 Of the six precautions mentioned in par. 24 as necessary for practical accuracy in drop-measuring, four are entirely omitted from the "Directions," and the drop-rate is only vaguely hinted at by the prescribing of "gentle pressure on the test," while the warning to get rid of ether would suggest the phenomenon of surface tension only to those not needing the warning. "At each stage of the procedure the pipette is carefully washed and dried out with successive quantities of absolute alcohol followed by successive quantities of ether" and the ether is got rid of. The fact that the recommendation of a precaution so expensive of time and of materials occurs twice with an interval of only about a hundred words suggests that the omissions were not due either to lack of space or to disregard of detail.

36 The omission of the precautions leads to serious errors in the details of the "Directions" and in the carrying out of those details with "Standard" pipettes. But before considering these errors we shall mention some serious errors in the "Standard" pipettes themselves as actually observed.

37 From the "Directions" it seems clear that only one size of "Standard" pipette is intended to be produced by the unpublished method of manufacture, whatever it is. The only three "Standard" pipettes that have come into my hands are of seriously different sizes. One, supplied to my order by authorised agents, has outer diameter 2.3 mm. and drop count 28.5 per c.c. The other two issued along with a set of S.A. cultures to workers performing an extensive Widal research have outer diameter 2.1 and 2.5 mm. and drop-count 31.7 and 25.4 respectively thus differing by some 20 per cent.

38 One of the errors referred to in par. 36 is that although an average serum has a drop-count per c.c. 1.1 times that of saline yet the worker is told that one "drop" of serum in nine "drops" of saline gives a 1 in 10 dilution. This "serum-error" of 10 per cent might be allowed for if it occurred alone. But it is complicated by the further errors now to be discussed.

39 A second error the "culture error" results similarly from not taking into account the fact that "Standard

Agglutinable Culture" has a drop-count 1.2 times that of serum. Thus, if the same pipette were used throughout the measuring, as is implied in the "Directions" each drop of S A Culture would have an error 20 per cent of itself.

40 Further, there were mentioned above and in paragraphs 9 and 10, which may be read again in connexion with this topic two pipettes, differing in drop-size some 20 per cent and indistinguishable by the unwarned worker. The use of these two pipettes as if they yielded equal drops causes the "pipette-error."

41 Now, if the larger pipette were used for the diluted serum the drop-count of which is practically that of saline, and the smaller pipette for S A Culture, of drop-count 1.2, then each drop of the S A Culture would be 40 per cent smaller than the companion drop of dilute serum. Even this "culture pipette-error" of 40 per cent might be allowed for. But it is complicated by the equal probability that the smaller pipette might happen to be used for the dilute serum and the larger for the culture by the same unwarned worker on another occasion, with the effect that the drop of dilute serum would then happen to be of the same volume as the drop of culture, thus making the "alternate culture pipette error" $\frac{1}{3}$. The application of the 40 per cent correction to all the results would make on these alternate results a 40 per cent error. So even the "culture-pipette-error" would baffle correction.

42 The reader will understand how the "culture pipette-error" is complicated also by the "serum error" or by a "serum pipette-error" produced by using these two pipettes for diluting the serum with saline. And he will understand that the three pipettes described here, of three different sizes, represent almost certainly, at least a good many other pipettes of those respective sizes made from the same lengths of tube.

Micro technique of the Wassermann Test

43 A micro technique of the Wassermann test with quantities just $\frac{1}{10}$ of those used by Fildes and McIntosh¹³ was used in a series of 263 serums and cerebro-spinal fluids just after the same samples had been tested by Dr Fildes with the full scale technique. The micro-technique may seem in places rather complicated. But the reader must remember that it was not composed *de novo* to suit the peculiarities of drop-measuring but was a faithful "transposition" of a well-established technique. It was intended to form a careful test of a tenth scale method against the ordinary scale method and at the same time a test of the adaptability of this drop-measuring method. The micro-test agreed with the macro-test in every case even quantitatively. Such agreement of a micro- with a macro-test is to be expected if the quantities are justly measured. The micro-test proved itself to be not only quick and reliable but also convenient and even indispensable in doing private practice tests when the sample sent was small and in, e.g., testing with four different antigens the small remnants of serum from the full scale tests. The great saving of reagents and of incubator space would often be of importance.

44 The test tubes to accommodate the total volume of 0.15 c.c. are about 6×1 c.c. outside measurement. They are conveniently hung in a single row of a dozen by their lip-flange which ought therefore to be 2 or 3 mm wide. The holed upper board of the tube stand is covered with a strip of stout brown paper pierced with a spike and then with a test tube which thus makes its own well fitting socket allowing well controlled shaking of a whole stand of tubes. The lower board of the stand is covered with white paper so that the little mass of unhemolysed red cells can easily be seen from above (Colourless flocculi as in the Widal test are best seen by similar side light from above against a black ground). The cover of the upper board may otherwise be made of white non inflammable celluloid mat on its upper surface for pencil marking with punched holes slit radially to give a spring grip.

45 The serum is inactivated in a clean water bath in Pasteur pipettes 5 mm outside and 3.5 mm inside diameter small enough to prevent the column of serum from breaking and flowing about in the tube. After inactivation the capillary is cut at No. 76. This gauge corresponding to 90 drops per c.c. of water will correspond to about 100 drops per c.c.

of serum the drop-count of which is on the average 1.1 times that of water.

46 The technique of the Wassermann test as given by Fildes and McIntosh in their recent paper in *Brain*, referred to in par 43 is closely followed, the actual quantities mentioned there being merely reduced to one tenth. Reference to that paper will accordingly elucidate obscurities due to the necessary brevity of this account.

47 *Standardisation of amboceptor (only occasionally necessary)*—In nine test tubes we have to put up micro-quantities of amboceptor ranging from 0.00001 to 9 times that. First we take 0.01 c.c.—i.e. 10 c.mm. of amboceptor, choosing the pipette thus. In the table in par 22 rabbit serum is found to have drop count 1.09 that of water. So the pipette required would give a water-drop of 10×1.09 —i.e. 10.9 c.mm. We choose the nearest to this M 76 with drop-volume just over 11, and we put 1 M 76 of amboceptor into 1 c.c. of saline, making a 1 in 100 dilution, with drop-count practically the same as that of water. Of this 0.1 c.c., i.e. 10 M 77, goes into 0.9 c.c. saline, i.e. into 1 c.c. of saline from which 10 M 77 have been taken with the M 77 pipette kept for saline, making amboceptor 1 in 1000. Of this we put into the tubes M 77 1 2 3, 8, 9, and then equalise with saline M 77 8, 7 6, 1, 0, thus making 0.09 c.c. in each tube.

48 Then of complement 1 in 2 we put 0.01 c.c.—i.e. practically 1 M 76—into each tube. The slight further excess in complement is here of no consequence. Finally, of 5 per cent. suspension of washed sheep corpuscles 0.05 c.c., i.e. 2×0.025 c.c., i.e. 2 M 54, goes into each tube. The total in each tube is now 0.15 c.c.

49 Incubate for 20 minutes at 37°C . For these small tubes the incubator suffices. Note what is the micro-minimal hemolytic dose of amboceptor (m M H D Amb) thus required for 0.05 c.c. of 5 per cent sheep corpuscles deposit. Three m M H D Amb is used in the Wassermann test.

50 *Standardisation of complement (daily)*—Of complement 1 in 24 we have to put into 9 tubes the following fractions of a c.c.—

0.01 0.0125, 0.05 0.0175, 0.02, 0.025, 0.03 0.035, 0.04

It will be seen that the common increment is 0.0025 for the first five and 0.005 for the last five, considering 0.02 twice. Indeed, the quantities are multiples as following of 0.0025 c.c.—4 5, 6, 7, 8, 10, 12, 14, 16

Now even drops of 0.005 c.c. are rather small for convenient use. The nearest multiple of 5 c.mm. that we have in our table is 2.5 times 5, i.e. 12.5 c.mm. i.e. M 73. So we dilute to 2.5 times weaker, i.e. to 1 in 60, and we put into the last five tubes

M 73 — — — — 4, 5, 6 7 8

Then as the common increment in the first four tubes is $\frac{1}{4}$ M 73 of 1 in 60 dilution we dilute the remainder to 1 in 120 so that we may make the common increment M 73 of 1 in 120. Of this new dilution we put into the first four tubes

M 73 4 5, 6 7, — — — —

To equalise add saline

M 73 4 3 2, 1, 4 3 2, 1, 0

—making up $\frac{8}{80}$ c.c., i.e. 0.1 c.c. in each tube. Lastly, we add of 5 per cent. corpuscles with 3 m M H D Amb 0.05 c.c. i.e. 2×0.025 c.c., i.e. 2 M 54 in each tube. After incubation for 20 minutes at 37°C we note the tube with least complement that has complete hemolysis. For the Wassermann test we use 2.5 m M H D C made up to 0.05 c.c. in each tube. As McIntosh and Fildes point out, if the m M H D C is found in the tubes corresponding to 0.0175 0.02 0.025 or 0.03 of the 1 in 24 dilution, then the 2.5 m M H D C for the Wassermann test will be obtained in 0.05 c.c. of 1 in 27 1 in 24 1 in 19, or 1 in 16 dilution respectively. We reject any weaker complement.

51 *Arrangement for the actual Wassermann test of 20 sera* each requiring 5 antigen tubes and one control without antigen, i.e. 120 tubes in all. The micro-M H D of amboceptor being, say 0.00003 c.c. of amboceptor and 3 m M H D Amb going to each tube we shall need 120×0.00003 i.e. 0.0108 c.c. amboceptor or 10.8 c.mm. Now since rabbit serum has its drop-count 1.09 times that of water (see table in par 22) the pipette that would give a serum drop 10.8 c.mm. would give a water drop 10.8×1.09 , i.e. 11.9 c.mm. The nearest is M 73, giving a water drop

¹³ McIntosh J. and Fildes P. Syphilis from the Modern Standpoint. London 1915. Fildes P. and McIntosh J. The Wassermann Reaction and its Application to Neurology. Brain xxxvii November 1914.

12.05 mm, only 1 per cent too large. The total volume of sensitised 5 per cent rbc suspension required is 120 x 0.05, i.e. 6 c.c., made up of 0.3 of the centrifuged deposit and 5.7 c.c. saline, or of 1.5 c.c. of 20 per cent rbc suspension and 4.5 c.c. saline. Accordingly we dilute 1 M 73 of amboceptor in 4.5 c.c. saline add 1.5 c.c. of 20 per cent rbc, and mix at once.

52 While the complement is being standardised antigen is prepared for 100 antigen tubes. They will require 100 x 0.05—i.e. 5 c.c. of 1 in 15 antigen dilution—made up of 0.33 c.c. mixed heart and cholesterol antigen and 4.7 c.c. saline added rapidly. The antigen may be measured as 33 M 54, M 54 giving 40 water drops, and therefore 40 x 2.5 i.e. 100 drops of antigen, per c.c. Of course, 1/3 c.c. of antigen is a quantity that could well be measured by a graduated pipette—one kept for antigen or else, if used for other liquids, well cleaned immediately after antigen. (But if the M 54 pipette after measuring antigen is shaken and allowed to dry partly and then roughly rinsed with water, it is in a suitably greasy condition in which it will deliver of the greasy antigen dilution 50 drops per c.c. And then, if the volume of antigen were made 0.06 instead of 0.05, i.e. if the total 5.7 c.c. were taken instead of 4.7 c.c., as the volume of the diluent saline for 100 doses, then 3 M 54 would deliver correctly the dose 0.06. In compensation 1 c.c. less of saline could be used in the complement by putting the 0.25 of complement into 4.75 c.c. of saline. The dose of diluted complement would then be 5/120 c.c., i.e. 42 c.mm. of 1 in 20 complement, with drop-count nearly the same as that of water. This volume, 42 c.mm., could be conveniently delivered as 2 M 56. But this plan of distributing the antigen and the complement separately is surpassed by the plan of combined distribution as described in the next paragraph.)

53 If the complement titre shows the m M H D C to be 0.02 c.c. of 1 in 24, then, taking for the actual test 2.5 m M H D C i.e. 2.5 x 0.02, i.e. 0.05 c.c., we shall need for 120 tubes 120 x 0.05 i.e. 6 c.c. of complement 1 in 24 i.e. 5.75 c.c. saline + 0.25 c.c. complement. If the requisite complement, 0.25 c.c., is measured by drops we may take 24 M 76 of complement since the drop-count of guinea pig serum by M 76 is 90 x 1.08, i.e. only 95.4, not quite 100 drops per c.c. But so large a quantity as 1/4 c.c. can be well measured by a graduated pipette. The dilution of antigen and the complement may, as recommended by McIntosh and Fildes, be mixed together immediately before distributing in a total quantity of 0.1 c.c., i.e. 4 M 51 or 5 M 55 per tube.

54 The schema of the test, given below, needs little further explanation. From each pipette of inactivated serum, cut, as described in par 44, at M 76 one drop each is put into tube 1 and tube 6, also, with 15 M 77 of saline, into a third tube. The contents of this tube are drawn into an M 77 pipette and are distributed to tubes 2, 3, 4, and 5, as indicated in the schema. The rack of tubes ought to be shaken after each ingredient.

55 Schema of the micro Wassermann test showing the six tubes belonging to one serum. All the quantities are in c.c.

Tube	1	2	3	4	5	6	Controls.

Shake. Incubate for 20 minutes at 37° C in incubator. Then read the results, or allow to stand for one hour at room temperature without shaking.									

56 In counting suspended bacteria and other cells the processes have general features in common. Several small drops of convenient known size are deposited in a group on an ordinary slide then dried, fixed by heating, collodionised by immersing while warm and dry in collodion of 1/10 B.P. strength, drained, dried, and heated to expel alcohol and to

render the film adherent in spite of wetting. The small circular drop-films, suitably stained and covered, form permanent preparations. In "blotting" all rubbing ought to be avoided, the blotting paper ought to be pressed down with a soft pad of cotton wool in surgical gauze. In mounting, the cover glass is pressed down on a minimum of clear soft paraffin gently warmed. Thus mounted and stored away from light, delicate stains such as pyronin methyl green last well. Seccotine may be used to "ring" the cover glass.

57 Wet-fixed preparations may be mounted in soft paraffin by using ligroin or heavy petroleum ether after or instead of xylol and by gently pressing on the preparation thus wet the cover glass with a drop of soft paraffin melted on it.

58 Details of treatment in counting bacteria depend on the nature and on the bacterial richness of the liquid. Milk, for instance, needs dilution to yield a tractable drop-film. 3 Morse 80 drops of milk, i.e. 3/183 c.c., diluted in 1 c.c. of germ free water, gave 164 drops per c.c. Three drops of this dilution gently dried, heated, rinsed with xylol then collodionised and stained with carbol fuchsin as described in par 59, showed 4000 bacteria per drop. Vaccines similarly need successive dilutions, by mixing one drop, e.g. M 20, in a 1 c.c. capsule of fresh distilled autoclaved water, and dropping without delay. On the other hand, in the case of water fresh from a filter a couple of drops may be successively dried on the same spot.

59 Stain adsorbing mineral matter, such as calcium carbonate, in dried water drop-films ought to be dissolved with very dilute HCl, one tenth per cent, before rinsing. All water drop-films ought to be wetted with 10 per cent alcohol before dropping on carbol fuchsin containing an extra 10 per cent of alcohol, which after a minute or so ought to be washed off with 10 per cent alcohol. All water used to stain or in treatment until staining is finished ought to be bacteria free, i.e. either fresh distilled or else fresh distilled and autoclaved before keeping. Finally the delicate drop-films are blotted, without rubbing, and mounted, as described in par 56. When desired, staining may be by Gram stain decolorised with 95 per cent alcohol, or by carbol fuchsin for acid fast bacilli.

60 In the drop-film counting of bacterial suspensions the actual area of the drop film can be easily calculated from the diameter as observed by the verniers on a mechanical stage, and for a conveniently small field the area corresponding to the square eyepiece diaphragm may be observed by viewing with the oil immersion lens the squares on a haemocytometer slide covered with a tiny square of cover glass mounted in water.

61 It may be noted that such direct and prompt counting of bacteria in water or in milk affords a valuable test either of the efficiency of a water filter or of the cleanness of a milk supply. Moreover, the drop-method seems to be the only method of depositing accurately and neatly on a slide a known volume of suspension.

62 Cell suspensions such as cerebro-spinal fluid and diluted blood may be stained with dilute Leishman stain for 7 to 15 minutes, or more if red cells are to be strongly shown up. Rinsing for a couple of minutes with very dilute, 0.01 per cent, acetic acid brightens the eosinophilia. Bacteria

sent in cerebro-spinal fluid may be stained as desired. Details of drop-methods of counting the cells in cerebro-spinal fluid the reader may consult the original paper¹⁵ describing the method and the results published as a tributary to the extensive work on parasyphilis by Dr Head and Fearnside with Dr Fildes and Dr McIntosh.

53. Blood dilutions may be conveniently made with a haemocytometer pipette or other capillary pipette whose lumen contained has been determined by weighing first dry and then filled with water to the mark. The figures from the haemocytometer pipette indicate, apparently, only proportionate volumes of bulb and stem.

64. The ordinary method of filling by mouth suction is pleasant, especially with a public ivory mouthpiece, and is certain in its results except in expert hands. When once a bore is filled beyond the mark expelling back the surplus to the mark leaves still on the walls of the wetted part a considerable portion of the very slender column of blood. But considerable precision can be attained by a mercury plunger-tube with stop-cock, even using only one end and the other hand yielding the blood. For the mercury plunger tube a piece of clean dry tubing 12 to 15 cm long and 1½ to 2 mm bore is opened out slightly funnel shaped at each end. One end is tightly plugged with grease-free cotton wool, the tube is filled about two thirds with clean mercury, and the other end is similarly plugged. A short rubber tube about 3 cm long is fitted to join one end of the tube to the side of a tiny brass stop-cock, such as is used for model engines, the other side being joined to the blood pipette by another short rubber tube. The suction of the falling mercury can be precisely regulated by the slope at which the mercury plunger tube is held. As the pipette gets filled near the mark the suction is slowed by lessening the slope, and the moment the mark is deliberately reached the stop-cock is shut. The pipette point is wiped with e.g., tissue paper, and the contents are washed out by repeatedly drawing up and expelling saline solution which has been previously measured into a small stoppered cylinder.

65. The drop-film method of counting the cells in diluted blood has some advantages over the counting chamber method. A differentiating stain such as Leishman's may be used. And the cells may be not only counted but also examined with suitable powers and proper lighting. Moreover, as soon as the drop-films are dried the further stages may be postponed at the worker's convenience. As regards the degree of dilution suitable for counting either or each of two methods may be followed. (1) To make the drop-film lensitic such as 5 or 10 c.mm blood in 10 c.c. saline this or normal blood will give in each of the drops 30 to 60 leucocytes and some 20 000 red cells. The red cells may be counted by observing the number of times that the field diameter is contained in the drop-film diameter, squaring the number to get the number of fields in the drop-film and hence computing on the content per average field. (2) To make the dilution say 100 to 200 times weaker so that the whole number of red cells may be counted through and computed from.

66. A phenomenon that led me to make some investigations not completed when the war broke out is the high degree of lability sometimes found in some of the red cells causing not only a considerable loss in drying a film but also on more than one occasion lysis of many of the red cells under one's very eye in the counting chamber illuminated by ordinary electric bulb. This lability is perhaps too little mentioned. Apparently it is prevented by the addition of a small amount of osmic acid solution to the dilution (and probably by other fixatives). The osmic acid, as Gustave Mann pointed out, increases the ability of the red cells to be stained strongly by fuchsin so that a rapid easy count of them can be made even with an 8 mm lens. This staining is especially applicable to a through count of a high dilution drop-film.

67. Summary.—In the two articles under this heading is described a simple method (communicated to the Royal Society in 1912) of gauging ordinary pipettes drawn from glass tube. The method is designed to make practically uniform drops of any required size "grow" readily in the

serological or in the chemical laboratory, whereas hitherto practically accurate drops, and those of a limited choice of sizes, have been produced only in the physical laboratory or from some more or less mysterious "plant" raised in the physical laboratory. Detailed directions and an extensive table of drop-volumes corresponding to various sizes of dropping point afford the means of making this method of drop-measuring generally applicable to the accurate measurement of small volumes of liquids. It is pointed out that the action of surface tension tends to make drop-measuring accurate and other methods of delivering small volumes inaccurate. Also there are outlined various applications of the method in serology and in counting directly bacteria and other cells.

Incidentally are described a simple method of rendering almost indelible ordinary blue black ink writing on slides, a method of mounting pyronin methylgreen stained sections permanent in soft paraffin, and a method of drawing blood with precision into a haemocytometer pipette.

A NOTE UPON THE EMPLOYMENT OF BLOOD TRANSFUSION IN WAR SURGERY¹

BY EDWARD ARCHIBALD, M.D.,
MAJOR, CANADIAN ARMY MEDICAL CORPS

JUDGING from my own observations, the value of transfusion lies chiefly in the quick supply of oxygen to the cells of the exsanguinated person. It is remarkable to see the immediate return of colour in the face of the blanched patient, and, moreover, it is now generally admitted that the transfused red cells remain alive and carry on normal function.

With regard to the technique, my own preference before the war was for the Kimpton tube, and this was used five times in four cases. There is, however, another method, the citrate method, recently brought forward, which seems to me peculiarly suited for easy adoption in Army work. Indeed, a chief purpose of these remarks is to call attention to the fact that we have in the citrate method a means of transfusing blood so simple that it can be done by a junior medical officer with the instruments at hand in any clearing hospital, and at the same time that it takes to give an intravenous saline. I have used the method on four occasions. The vein of the donor is exposed under novocaine, the end of an ordinary glass medicine-dropper inserted into the distal end of the vein, a bandage having been tied round the arm above, and the blood allowed to flow into a glass graduate. An assistant holds the vessel, in which 1½ drachms of a 10 per cent solution of sodium citrate in distilled water has been previously placed and stirs constantly with a glass rod. After 8 ounces have been taken, a further 1½ drachms of the solution are added, that being the proportion of citrate advised for each quantity of 8 ounces. (The original recommendation is 5 c.c. of a 10 per cent solution of sodium citrate to 250 c.c. of blood, or 30 c.c. of a 2 per cent solution to 300 c.c. of blood.) Thereupon, the vein of the recipient being exposed, and an ordinary cannula provided with a short piece of rubber tubing being inserted, the blood is injected with an ordinary 4-ounce glass syringe. There would appear to be no danger of clotting. Nothing could be more simple. One can deal with the blood as one would deal with saline.

We are yet naturally, uncertain as to the results. Undoubtedly the procedure if extensively tried at the front, as I venture to recommend will in many cases accomplish nothing, or too little. We have to consider above all the coincidence of shock, for which, as has been shown recently by Libmann and Ottenberg transfusion of blood is of little, if any value. The recent work on shock seems to prove clearly enough that that condition is due to no primary loss of power in the vaso-motor centre, nor to lack of blood, but rather to the displacement of a critical amount of blood from the arterial to the venous side of the circulation and its retention to a large extent on that side. Consequently, a transfusion of blood may do no more good than the infusion of an equal quantity of saline, and often enough neither

¹ This paper was submitted for publication last April.

can work any lasting benefit. On the other hand, cases of shock complicated by severe hæmorrhage might be tided over by a transfusion of blood and recover from their shock when they otherwise would not.

Where a severe infection is present, particularly if it has become a septicæmia, one can hardly expect often to save life by a transfusion. One of my cases, with gas gangrene of the thigh, exsanguinated and in very bad general condition, was sufficiently improved by a transfusion to stand an amputation in the upper third, but he died a day later from extension of his infection. Such a type of case would yield many disappointments. It might be questionable, also, whether a very large effusion of blood into the thorax should indicate a transfusion. Probably not, as such patients so rarely died from hæmorrhage pure and simple. At most one might do it with coincident aspiration of blood from the thorax and insufflation of oxygen for compression of the lung as we did at the base after the lapse of a week or so. With regard to the abdominal cases, in which so often operation discloses a belly full of blood I entertained, from *a priori* considerations, high hopes that transfusion would save many lives. But with observation of the cases of others, and of post mortems and with the study of my own cases (at present numbering only some 35, it should be said) I have become gradually impressed with the belief that shock kills more often than pure hæmorrhage, and that, even when a considerable amount of blood is found in the cavity the later death, if it occurs, is often more directly the result of the shock than of the loss of blood. It falls to be said that some of those with whom I have discussed this question, whose experience is much greater than my own, maintain that hæmorrhage, rather than shock, is the great cause of death in the first day or two after an abdominal wound. If their opinion is correct, transfusion is all the more indicated. If not, transfusion is still indicated, but disappointments must be expected. And in either case, if we are to diminish the still high mortality of the abdominal cases, transfusion I think, is the first and most promising means that demands trial.

Four transfusions in three patients were done last autumn in a general hospital—all at the base—for secondary hæmorrhage of very severe degree. Of these, two were done by myself and two by a colleague (Major Hill), who kindly allows me to use his notes. Finally, five more have been done in a clearing hospital at the front within the last three months. I append notes of some typical cases of transfusion of blood with which I have had to do.

CASE 1—Very extensive foul shell wound tearing through the posterior thigh muscles. About the eighth day a hæmorrhage of moderate severity, controlled by packing. Three days later a second and very grave hæmorrhage, leaving the patient almost pulseless. Intravenous saline, which did but little good. Under anæsthetic impossible to find bleeding point because of cessation of bleeding. Pulse disappeared entirely on the table, and patient was apparently in *extremis*, whereupon 250 c.c. of blood were transfused. The effect was quite remarkable, some colour reappeared in his cheeks and ears and the pulse was restored. He rallied well, but ran a very high temperature for a week (103° to 105° F.), which was ultimately found to be due to a streptococcus septicæmia. Then he had a third slight hæmorrhage, easily controlled, and on the following day a fourth severe one. He was again reduced to an almost pulseless condition, was blanched, and was quite lethargic. An intravenous saline of nearly 2 pints did not alter his condition a whit, but a transfusion of 700 c.c. of blood (20 ounces) an hour later worked a most remarkable change, some colour returned immediately, his pulse grew fairly strong though rapid, he became bright again and demanded things with all of his former irritability, and, in fact, one could hope with some reason that he would pull through. Unfortunately, during the night he had a fifth small hæmorrhage, became extremely restless, and died some 20 hours after the last transfusion, largely from hæmorrhage, partly from sepsis. Necropsy showed a tear in the profunda femoris. It had never been possible to catch it bleeding.

CASE 2—A boy, with a shell wound in the shoulder the fragment having gone right through the deltoid inwards, there had been very little infection and the wound was healing well when, nearly three weeks after the injury he had a most severe hæmorrhage. On the operating table he was quite pulseless and absolutely blanched. An intravenous saline did no good. A transfusion of 750 c.c., or 24 oz. of blood was then done, with the same gratifying results. The wound was then opened and an opening in the terminal portion of the axillary artery found. The artery was ligatured. The boy made a splendid recovery, and in about 10 or

12 days was discharged to England. It is tragic to relate that he was one of those who went down in the *Ankuta*.

Of the five cases occurring in a casualty clearing hospital, notes of two are given as follows.

CASE 3—Wound of abdomen from fragment of shell. Admitted at 3.30 P.M., having been hit two or three hours previously. He was very pale, the pulse was 76 and very weak. His blood pressure was 75 systolic and 55 diastolic (Tykos instrument). He was in great pain and was obviously suffering from severe shock. The wound of entry was in the mid left rectus two inches above the umbilicus, and the missile could be felt under the skin in the right loin posteriorly. Operation was begun at 4 P.M. There was found a large amount of blood in the pelvis and in both flanks. The root of the mesentery in its upper part was infiltrated with blood. The missile had perforated both walls of the stomach near the greater curvature. Bleeding seemed to have stopped and its source could not be determined, but was thought to be from the gastric vessels. The tears were sutured, and at the close of the operation he was given 17 oz. of blood to which had been added 3 drachms of a 10 per cent solution of sodium citrate in the manner already described. During the operation the patient had become pulseless. The blood transfused made his pulse palpable, and, indeed, sufficiently so as to give one hope that he would rally. Yet it did not restore his colour to any noticeable extent. After this temporary improvement, which lasted some three or four hours, his pulse failed rapidly and he died at midnight, about 12 hours after being hit and seven hours after operation. At the post-mortem examination it was found that no fresh bleeding of any extent had occurred. A wound of the second portion of the duodenum on its postero-lateral surface and a ragged perforation of the lower pole of the right kidney without injury to the renal vessels had been overlooked at the operation. It seemed reasonable to conclude that the cause of death, while in part hæmorrhage, was largely shock. The total amount of blood lost did not by itself appear to be sufficient to account for death.

CASE 4—Admitted at 8.45 A.M., on April 6th, 1916, suffering from very extensive wounds of the left knee, the right foot, and the right thigh. He had lost a great deal of blood and was also in shock, with pulse a mere flicker running 140 approximately, and blood pressure 45 systolic diastolic being unobtainable. Rectal saline with coffee and brandy failed to improve his condition. An intravenous saline with gelatine given at 1.30 P.M. brought his blood pressure up to 85 systolic and 45 diastolic. At 3 P.M. his systolic pressure was 75, and at 4 P.M. it was 72 while diastolic was 60. At 4.30 P.M. the left leg was amputated above the condyles, and the vast wound in the middle of the right thigh was cleaned by cutting away all necrotic muscle. It was badly contaminated with straw and soil. At the close of the operation the pulse had disappeared at the wrist. Respirations were rapid and he was very pale. The citrated blood obtained the night before for another case and not used had been preserved, and this was now injected into this patient's vein, about 16 oz. in all. It brought back quite a pink colour to the face and restored the pulse, which was counted to 130. He rallied fairly well and one felt able to hope for recovery, but gas gangrene declared itself the next afternoon in the right leg and advanced so rapidly that operation was out of the question. He died at 6.10 A.M. on April 8th, about 48 hours after the injury.

Of the eight patients one was saved by transfusion, and one recovered after alarming symptoms due probably to isoagglutinins in the donor's blood, in spite therefore of the transfusion. Our efforts in the other six patients were defeated, twice by the repetition of hæmorrhages with the coincidence of sepsis twice by gas gangrene, and twice by the preponderating effect of shock. Only desperate cases have been chosen.

It may be urged that 16 oz. is an insufficient quantity to transfuse. This may be so. Yet I cannot but think that a pint of fresh blood ought to be sufficient to tide the man over the immediate danger of a large hæmorrhage as indeed it clearly did in certain of our patients. If severe sepsis and shock complicate the picture, it is doubtful whether a larger quantity of blood would accomplish more.

In the first three patients those with secondary hæmorrhage treated at the base the blood was given by the medical officers who were keen to volunteer. It was found that the withdrawal of 16 oz. affected them not at all. Twice however 20 and 24 oz. were taken, and then the officers concerned did experience for a couple of days a feeling of lassitude and easy fatigue, although neither was obliged to go to bed or even give up his service. At the front the volunteers for the four transfusions were got without the least trouble. There will always be more than enough men willing to give blood
